The amount of energy released during an earthquake is usually expressed as a magnitude and is measured directly from the earthquake as recorded on seismographs. An earthquake's magnitude is expressed in whole numbers and decimals (e.g., 6.8). Seismologists have developed several magnitude scales, as discussed in Section 4.3.11 of the Base Plan. Placer County itself is traversed by a series of northwest-trending faults, called the Foothill Fault Zone, that are related to the Sierra Nevada uplift. This was the source of Oroville's 1975 earthquake (and an earlier event in the 1940s). Subsequent research of these events led to the identification and naming of the zone and questions about the siting and design of the proposed Auburn Dam. Earthquakes on nearby fault segments in the zone could be the source of ground shaking in the Placer County Planning Area.

Although portions of western and eastern Placer County are located in a seismically active region, no known faults actually go through any of the cities or towns. However, the Bear Mountain and the Melones faults are situated approximately three to four miles west and east of the City of Auburn respectively. Earthquakes on these two faults would have the greatest potential for damaging buildings in Auburn, especially the unreinforced masonry structures in the older part of the city and homes built before 1960 without adequate anchorage of framing and foundations. Similar lower magnitude but nearby earthquakes are capable of producing comparable damages in other Placer County communities.

Another measure of earthquake severity is intensity. Intensity is an expression of the amount of shaking at any given location on the ground surface. Seismic shaking is typically the greatest cause of losses to structures during earthquakes. The District is located in an area where few earthquakes of significant magnitude occur, so both magnitude and intensity of earthquakes are expected to remain low. Seismic shaking maps for the area show Placer County and the District fall within a low to moderate shake risk.

Past Occurrences

There have been no past federal or state disaster declarations from this hazard. The District noted no past occurrences of earthquakes or that affected the District in any meaningful way.

Vulnerability to and Impacts from Earthquake

The combination of plate tectonics and associated California coastal mountain range building geology generates earthquake as a result of the periodic release of tectonic stresses. Placer County lies in the center of the North American and Pacific tectonic plate activity. There have been earthquakes as a result of this activity in the historic past, and there will continue to be earthquakes in the future of the California north coastal mountain region.

Fault ruptures itself contributes very little to damage unless the structure or system element crosses the active fault; however, liquefaction can occur further from the source of the earthquake. In general, newer

construction is more earthquake resistant than older construction due to enforcement of improved building codes. Manufactured buildings can be very susceptible to damage because their foundation systems are rarely braced for earthquake motions. Locally generated earthquake motions and associated liquefaction, even from very moderate events, tend to be more damaging to smaller buildings, especially those constructed of unreinforced masonry (URM) and soft story buildings. The District believes there are no URM or soft story buildings in the District.

The Uniform Building Code (UBC) identifies four seismic zones in the United States. The zones are numbered one through four, with Zone 4 representing the highest level of seismic hazard. The UBC establishes more stringent construction standards for areas within Zones 3 and 4. All of California lies within either Zone 3 or Zone 4. The AFPD is within the less hazardous Zone 3.

Impacts from earthquake in the District will vary depending on the fault that the earthquake occurs on, the depth of the earthquake strike, and the intensity of shaking. Large events could cause damages to infrastructure, critical facilities, residential and commercial properties, and possible injuries or loss of life.

Assets at Risk

All assets listed in Table F-4 will be at risk from earthquakes, and while significant earthquakes do not regularly occur within the district, moderate earthquakes do occur on an interval of about once every 10 years, with potential for a large 6.0+/- magnitude quake about 1 time every 100 years.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence—Occasional
Vulnerability—Medium

Hazard Profile and Problem Description

Flooding occurs in areas other than the FEMA mapped 1% and 0.2% annual chance floodplains. Flooding may be from drainages not studied by FEMA, lack of or inadequate drainage infrastructure, or inadequate maintenance. Localized, stormwater flooding occurs throughout the County during the rainy season from November through April. Prolonged heavy rainfall contributes to a large volume of runoff resulting in high peak flows of moderate duration.

Location and Extent

The AFPD is subject to localized flooding throughout the District. Flood extents are usually measured in areas affected, velocity of flooding, and depths of flooding. Expected flood depths in the District vary by location. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Localized flooding in the District tends to have a shorter speed of onset, especially when antecedent rainfall has soaked the ground and reduced its capacity to absorb additional moisture. The most significant ponding of water in the district related to heavy rainfall are low spots or areas that are drained by culverts which tend to plug up with debris.

Past Occurrences

There have been no federal or state disaster declarations in the County due to localized flooding. The District noted that localized flooding past occurrences can be found in the Severe Weather: Heavy Rains and Storms section of this Annex below.

Vulnerability to and Impacts from Localized Flooding

Historically, much of the growth in the District and County has occurred adjacent to streams, resulting in significant damages to property, and losses from disruption of community activities when the streams overflow. Additional development in the watersheds of these streams affects both the frequency and duration of damaging floods through an increase in stormwater runoff.

Primary concerns associated with stormwater flooding include life safety issues, and impacts to property and to infrastructure that provides a means of ingress and egress throughout the community. Ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Objects can also be buried or destroyed through sediment deposition. Floodwaters can break utility lines and interrupt services. Standing water can cause damage to crops, roads, and foundations. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

Heavy rains occur on an annual basis in the Alta FPD service area. Impacts to the area usually include mild flooding and damage to infrastructure roads. The District experiences localized flooding annually. Though a drought was affecting much of California, heavy rains caused mild to moderate damages in the area and increasing hazards on Highway 80, a critical commercial corridor that goes through the District.

Flooding generally has not affected the ability for the fire department to respond to emergencies, but a plugged culvert or ditch could cause issues in a number of locations in the district, such as on Alta Reservoir Rd or Drum Powerhouse Rd.

Assets at Risk

No assets listed in Table F-4 have a general risk of flooding as the assets are all located in generally well drained area, but a blocked culvert or ditch could increase the risk of flooding at all of these facilities, but the likelihood of such an event would be low.

Landslide, Mudslide, Debris Flows

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

According to the California Geological Survey, landslides refer to a wide variety of processes that result in the perceptible downward and outward movement of soil, rock, and vegetation under gravitational influence. Common names for landslide types include slump, rockslide, debris slide, lateral spreading,

debris avalanche, earth flow, and soil creep. Landslides may be triggered by both natural and human-induced changes in the environment that result in slope instability.

The susceptibility of an area to landslides depends on many variables including steepness of slope, type of slope material, structure and physical properties of materials, water content, amount of vegetation, and proximity to areas undergoing rapid erosion or changes caused by human activities. These activities include mining, construction, and changes to surface drainage areas. Landslide events can be determined by the composition of materials and the speed of movement. A rockfall is dry and fast while a debris flow is wet and fast. Regardless of the speed of the slide, the materials within the slide, or the amount of water present in the movement, landslides are a serious natural hazard.

Debris flows can also occur in some areas of the County and the District. These debris flows generally occur in the immediate vicinity of existing drainage swales or steep ravines. Debris flows occur when near surface soil in or near steeply sloping drainage swales becomes saturated during unusually heavy precipitation and begins to flow downslope at a rapid rate. Debris flows are also common during the rainy season in post fire areas.

Location and Extent

Landslides, mudslides, and debris flows can affect certain areas of the District. The CGS has estimated that the risk varies across the District and has created maps showing risk variance. This risk variance falls into multiple categories. These are discussed in Section 4.3.14 of the Base Plan. According to the District Planning Team, risk varies within the District range from low to moderate. The speed of onset of landslide is often short, especially in post-wildfire burn scar areas, but it can also take years for a slope to fail. Landslide duration is usually short, though digging out and repairing landslide areas can take some time.

Past Occurrences

There have been no federal or state disaster declarations in the County from landslide. The District Planning Team noted the following past occurrences:

There have been landslides within the District, historically the E. Towle/W. Towle landslide (no specific dates could be recalled) which removed the historic Town of Towle. Old historic underground mining operations have caused fatal events within the District as well. The combination of large underground spring water sources and abandoned unmapped mining tunnels are common within the District. The combination of large underground spring water sources and abandoned unmapped mining tunnels are common within the District and several collapses resulting in sinkholes have occurred in the last 15 years.

On **February 10, 2017** heavy rains lead to a mudslide and rockslide that closed all lanes of traffic on Interstate 80 in the Alta, CA area. It took CalTrans several days to clean-up the slide and put in temporary barriers and fixes in place until the ground dried up enough to make more permanent fixes. The barriers still exist, but slope stabilization techniques were utilized to reduce but not eliminate the risk of slope failure in this specific location.

Vulnerability to and Impacts from Landslide

Although landslides are primarily associated with slopes greater than 15 percent, they can also occur in relatively flat areas and as cut-and-fill failures, river bluff failures, lateral spreading landslides, collapse of wine-waste piles, failures associated with quarries, and open-pit mines. Landslides may be triggered by both natural- and human-caused activity.

The District has identified several areas prone to landslides. These include the following landslide prone areas:

- Cut slopes for Roadways including Interstate 80
- Portions of the ends of East and West Towle Rd
- Cut and fill slopes for the Railroad

Assets at Risk

All District assets from Table F-4) are at risk from this hazard.

Severe Weather: Extreme Heat

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to FEMA, extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. Heat kills by taxing the human body beyond its abilities. In extreme heat and high humidity, evaporation is slowed, and the body must work extra hard to maintain a normal temperature.” Most heat disorders occur because the victim has been overexposed to heat or has over-exercised for his or her age and physical condition. Older adults, young children, and those who are sick or overweight are more likely to succumb to extreme heat.

In addition to the risks faced by citizens of the District, there are risk to the built environment from extreme heat. While extreme heat on its own does not usually affect structure, extreme heat during times of drought can cause wildfire risk to heighten. Extreme heat and high winds can cause power outages and PSPS events, causing issues to buildings in the District.

Extreme Heat and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power

disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS.

More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Location and Extent

Heat is a regional phenomenon and affects the whole of the District. Heat emergencies are often slower to develop, taking several days of continuous, oppressive heat before a significant or quantifiable impact is seen. Heat waves do not strike victims immediately, but rather their cumulative effects slowly affect vulnerable populations and communities. Heat waves do not generally cause damage or elicit the immediate response of floods, fires, earthquakes, or other more "typical" disaster scenarios.

The NWS has in place a system to initiate alert procedures (advisories or warnings) when extreme heat is expected to have a significant impact on public safety. The expected severity of the heat determines whether advisories or warnings are issued. The NWS HeatRisk forecast provides a quick view of heat risk potential over the upcoming seven days. The heat risk is portrayed in a numeric (0-4) and color (green/yellow/orange/red/magenta) scale which is similar in approach to the Air Quality Index (AQI) or the UV Index. This can be seen in Section 4.3.2 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for heat. The District Planning Team noted that since extreme heat is a regional phenomenon, events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.2.

Generally, extreme heat in the district only occurs for 1-2 weeks per year with temperature in the mid to upper 90's or low 100's. The rest of the summer and fall, the heat is not usually an issue, but the low humidity associated with regional heat waves affecting Western Placer County does have an impact on the dryness of fuels on the western slope of the Sierra Nevada mountains and the Alta Fire Protection District.

Vulnerability to and Impacts from Extreme Heat

The District experiences temperatures in excess of 100°F during the summer and fall months. The temperature moves to 105-110°F in rather extreme situations. During these times, drought conditions may worsen. Also, power outages and PSPS events may occur during these times as well. Health impacts,

including loss of life, are the primary concern with this hazard, though economic impacts are also an issue. Extreme hot weather within the region, accompanies low humidity and increased risk of wildfire ignition and extreme fire behavior. Ignition potential is further increased due to critically low fuel moistures resulting from years of drought.

Days of extreme heat have been known to result in medical emergencies, and unpredictable human behavior. Also vulnerable to the effects of extreme hot weather is the elderly population located within District boundaries. The District contains a significant elderly population, with some residing in homes that have not been sufficiently updated to protect against extreme temperatures. Periods of extended heat and dryness (droughts) can have major economic, agricultural, and water resources impacts. Extreme heat can also dry out vegetations, making it more vulnerable to wildfire ignitions. Wildfires are the most significant heat related risk factors in the Alta Fire Protection District.

Assets at Risk

All assets listed in Table F-4 are at risk from severe heat waves and the related risks of wildfire.

Severe Weather: Freeze and Snow

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to the NWS and the WRCC, winter snowstorms can include heavy snow, ice, and blizzard conditions. Heavy snow can immobilize a region, stranding commuters, stopping the flow of supplies, and disrupting emergency and medical services. Accumulations of snow can collapse roofs and knock down trees and power lines. In rural areas, homes and farms may be isolated for days, and unprotected livestock may be lost. The cost of snow removal, damage repair, and business losses can have a tremendous impact on cities and towns.

Heavy accumulations of ice can bring down trees, electrical wires, telephone poles and lines, and communication towers. Communications and power can be disrupted for days until the damage can be repaired. Power outages can have a significant impact on communities, especially critical facilities such as public utilities. Even small accumulations of ice may cause extreme hazards to motorists and pedestrians.

Some winter storms are accompanied by strong winds, creating blizzard conditions with blinding wind-driven snow, severe drifting, and dangerous wind chills. Strong winds accompanying these intense storms and cold fronts can knock down trees, utility poles, and power lines. Blowing snow can reduce visibility to only a few feet in areas where there are no trees or buildings. Serious vehicle accidents with injuries and deaths can result. Freezing temperatures can cause significant damage to the agricultural industry.

The District experiences both rain and snow and depending on the specific event and timing, either are equally problematic. About 5 years of every 10 have at least 1 significant rain or snow event with about 3 out of every 10 years having multiple significant or a string of significant heavy rain and/or snow events resulting in localized flooding, road closures and downed trees.

Location and Extent

Freeze and snow are regional issues, meaning the entire District is at risk to cold weather and freeze events. While there is no scale (i.e. Richter, Enhanced Fujita) to measure the effects of freeze, the WRCC reports that in a typical year, minimum temperatures fall below 32°F on 209.0 days with 0.4 days falling below 0°F in eastern Placer County. Snowfall is measured in depths, and the WRCC reports that average snowfall on the eastern side of the County is 190.7 inches. Freeze and snow have a slow onset and can generally be predicted in advance for the County. Freeze events can last for hours (in a cold overnight), or for days to weeks at a time. Snow event can last for hours or days, and the snow stays all winter in the eastern portion of the County, often with significant snow depths. The Alta Fire Protection District generally receives an average precipitation amount of 75-85 inches per year. Some of that precipitation falls as snow and an average snow year is 6-10 feet depending on the elevation in the district (~3500-4500ft). The district received 120 inches of rainfall in 2007-08 and 10-16ft of snow at least twice in the last decade. Blue Canyon, about 5 miles East of the Alta Fire Protection District, receives one of the highest amounts of precipitation in California on an annual basis.

Past Occurrences

There has been no federal and one state disaster declarations in the County for freeze and snow, as shown on Table F-6.

Table F-6 Placer County – State and Federal Disaster Declarations from Freeze and Snow 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Freeze	1	1972	0	–

Source: Cal OES, FEMA

The District noted that cold and freeze is a regional phenomenon; events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.3. Freeze and snow are an annual occurrence within the District.

Vulnerability to and Impacts from Severe Weather: Freeze and Snow

The District experiences temperatures below 32 degrees during the winter months. Freeze can cause injury or loss of life to residents of the District. While it is rare for buildings to be affected directly by freeze, damages to pipes that feed building can be damaged during periods of extreme cold. Freeze and snow can occasionally be accompanied by high winds, which can cause downed trees and power lines, power outages, accidents, and road closures. Transportation networks, communications, and utilities infrastructure are the most vulnerable physical assets to impacts of severe winter weather in the County.

In the District, this severe weather severely impacts the Highway 80 commercial corridor and compromises resident and emergency responder's ingress and egress. Infrastructure road surface damage and pavement deterioration are also concerns during winter. The elderly and special needs population located within District boundaries also require monitoring during severe weather episodes. The District contains a

significant elderly population, with some residing in homes that have not been sufficiently updated to protect against extreme temperatures.

Assets at Risk

All District assets (from Table F-4) are at risk from this hazard.

Severe Weather: Heavy Rains and Storms

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Storms in the District occur annually and are generally characterized by heavy rain often accompanied by strong winds and sometimes lightning and hail. Approximately 10 percent of the thunderstorms that occur each year in the United States are classified as severe. A thunderstorm is classified as severe when it contains one or more of the following phenomena: hail that is three-quarters of an inch or greater, winds in excess of 50 knots (57.5 mph), or a tornado. Heavy precipitation in the District falls mainly in the fall, winter, and spring months.

Location and Extent

Heavy rain events occur on a regional basis. Rains and storms can occur in any location of the District. All portions of the District are at risk to heavy rains. Most of the severe rains occur during the fall, winter, and spring months. There is no scale by which heavy rains and severe storms are measured. Magnitude of storms is measured often in rainfall and damages. The speed of onset of heavy rains can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of severe storms in California, Placer County, and the District can range from minutes to hours to days. Information on precipitation extremes can be found in Section 4.3.4 of the Base Plan.

Past Occurrences

There have been past disaster declarations from heavy rains and storms, which were discussed in Past Occurrences of the flood section above. According to historical hazard data, severe weather, including heavy rains and storms, is an annual occurrence in the District. This is the cause of many of the federal disaster declarations related to flooding.

A specific event was recalled by the District. In January of 2018 there was a severe rain events that caused flooding and culvert failures. The biggest impacts were felt at High Risk to Casa Loma Rd – Canyon Creek crossing about ½ mile upstream. The Road was severely eroded and at risk to slide. Temporary fixes such as rip-rap, and temporary road dividers are the permanent fix put in place by Placer County. This road services 100’s of residences on Moody Ridge and Casa Loma and is the eastern access point for all these residences. The western access point is on the west end of Mood Ridge Rd and is an old, converted flatbed railroad car which cannot support some fire engines and large equipment. This western bridge is at a moderate risk of being washed out and cannot provide adequate access for fire protection should the eastern

access bridge be washed out. Road closures continued for 6 months for clean-up, design and construction of bridge affecting access for approximately 15 homes and a Sons of Norway camp. Cleanup and bridge construction was said to have been ~3 million USD. Fill that washed down stream was approximately 80ft long x 40ft deep.

Vulnerability to and Impacts from Heavy Rain and Storms

Heavy rain and severe storms are the most frequent type of severe weather occurrences in the District. These events can cause localized flooding. Elongated events, or events that occur during times where the ground is already saturated can cause 1% and 0.2% annual chance flooding. Wind often accompanies these storms and has caused damage in the past. Hail and lightning are rare in the District.

Actual damage associated with the effects of severe weather include impacts to property, critical facilities (such as utilities), and life safety. Heavy rains and storms often result in localized flooding creating significant issues. Roads can become impassable and ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Floodwaters and downed trees can break utilities and interrupt services.

During periods of heavy rains and storms, power outages can occur. These power outages can affect pumping stations and lift stations that help alleviate flooding.

Assets at Risk

All District assets (from Table F-4) are at risk from this hazard.

Severe Weather: High Winds and Tornadoes

Likelihood of Future Occurrence—Highly Likely

Vulnerability—Medium

Hazard Profile and Problem Description

High winds, as defined by the NWS glossary, are sustained wind speeds of 40 mph or greater lasting for 1 hour or longer, or winds of 58 mph or greater for any duration. High winds can cause significant property and crop damage, threaten public safety, and have adverse economic impacts from business closures and power loss. High winds can also cause PSPS events.

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes form when cool, dry air sits on top of warm, moist air. Tornadoes are the most powerful storms that exist. Tornadoes, though rare, are another severe weather hazard that can affect areas of the Placer County Planning Area, primarily during the rainy season in the late fall, winter, and early spring.

Location and Extent

The entire District is subject to significant, non-tornadic (straight-line), winds. Each area of the County is at risk to high winds. Magnitude of winds is measured often in speed and damages. These events are often part of a heavy rain and storm event, but can occur outside of storms. The speed of onset of winds can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of winds in California is often short, ranging from minutes to hours. The Beaufort scale is an empirical 12 category scale that relates wind speed to observed conditions at sea or on land. Its full name is the Beaufort Wind Force Scale. The Beaufort Scale was shown in Section 4.3.5 of the Base Plan.

Portions of the County are also located in a special wind hazard region, which is a result of foehn winds. A foehn wind is a type of dry down-slope wind that occurs in the lee (downwind side) of a mountain range. Winds of this type are called "snow-eaters" for their ability to make snow melt or sublimate rapidly. This snow-removing ability is caused not only by warmer temperatures, but also the low relative humidity of the air mass coming over the mountain(s). They are also associated with the rapid spread of wildfires, making some regions which experience these winds particularly fire prone.

Tornadoes, while rare, can occur at any location in the County and District. Prior to February 1, 2007, tornado intensity was measured by the Fujita (F) scale. This scale was revised and is now the Enhanced Fujita scale. Both scales are sets of wind estimates (not measurements) based on damage. The new scale (EF) provides more damage indicators (28) and associated degrees of damage, allowing for more detailed analysis and better correlation between damage and wind speed. It is also more precise because it considers the materials affected and the construction of structures damaged by a tornado. The F Scale and EF Scale are shown in Section 4.3.5 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for winds and tornadoes. The District noted that since high winds is a regional phenomenon, events that affected the middle elevations of the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.5.

Vulnerability to and Impacts from Severe Weather: Wind and Tornado

High winds are common occurrences in the District throughout the entire year. Straight line winds are primarily a public safety and economic concern. Windstorm can cause damage to structures and power lines which in turn can create hazardous conditions for people. Debris flying from high wind events can shatter windows in structures and vehicles and can harm people that are not adequately sheltered. High winds can impact critical facilities and infrastructure and can lead to power outages. Wind can also drive wildfire flames, spreading wildfires quickly. During periods of high winds and dry vegetation, wildfire risk increases. High winds that occur during periods of extreme heat can cause PSPS events to be declared in the County.

Impacts from high winds in the District will vary. Future losses from straight line winds include:

- Downed trees
- Power line impacts and economic losses from power outages

- Increased PSPS events
- Occasional building damage, primarily to roofs

In the District, wind and heavy rain events will bring trees down, and occasionally onto homes. This severe weather severely impacts the Highway 80 commercial corridor and compromises resident and emergency responder's ingress and egress. Infrastructure road surface damage and pavement deterioration are also concerns during winter. The elderly and special needs population located within District boundaries also require monitoring during severe weather episodes. The District contains a significant elderly population, with some residing in homes that have not been sufficiently updated to protect against extreme weather events.

Assets at Risk

All District assets (from Table F-4) will be at risk from issues related to heavy winds resulting in downed trees landing on structures and power lines.

Tree Mortality

Likelihood of Future Occurrence—Highly Likely
Vulnerability—High

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, and contribute to future fuel loads in forests surrounding communities. During extended drought, tree mortality is driven by a build-up in endemic bark beetle populations and exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events.

Location and Extent

Onset of tree mortality events can be relatively fast; however conditions – such as high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas, and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 - 40 dead trees per acre
- Orange depicting 5 -15 dead trees per acre
- Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A

number of Placer County areas were designated during this event and the majority of Placer County watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality, along with numerous Tier 1 High hazard “hot spots”. A map of these areas was shown in in Section 4.3.18 of the Base Plan.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015.

There is not significant tree mortality within the district at this time. Most of the tree mortality in the district has been small stands of trees and less than an acre for each occurrence. The largest known incident within the district is on the East side of Lake Alta and is approximately about an acre in size. Just west of Lake Alta, the Frost Hill subdivision experienced about a 20-40 acre area of nearly 100% tree mortality related to the Bark Beetle.

Vulnerability to and Impacts from Tree Mortality

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

. Recent years of drought stress have resulted in high mortality levels, leaving the forest susceptible to disease and insect infestation. As a result of recent drought conditions throughout California, infestations of the Pine Beetle are on the rise and pockets of mortality are rapidly spreading. Several areas within the District forests show signs of Pine Beetle and thus will become more vulnerable to wildfire.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead trees within the wildland urban intermix or wildland urban interface or urban areas therefore pose a greater risk to due to their proximity to residents, businesses, and road, power, and communication infrastructure.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure.

Impact to the District directly related to Bark Beetle related tree mortality is increased wildfire risk from the fuel loads.

Assets at Risk

All assets listed in Table F-4 will be at risk from increased wildfire behaviors.

Wildfire

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Extremely High

Hazard Profile and Problem Description

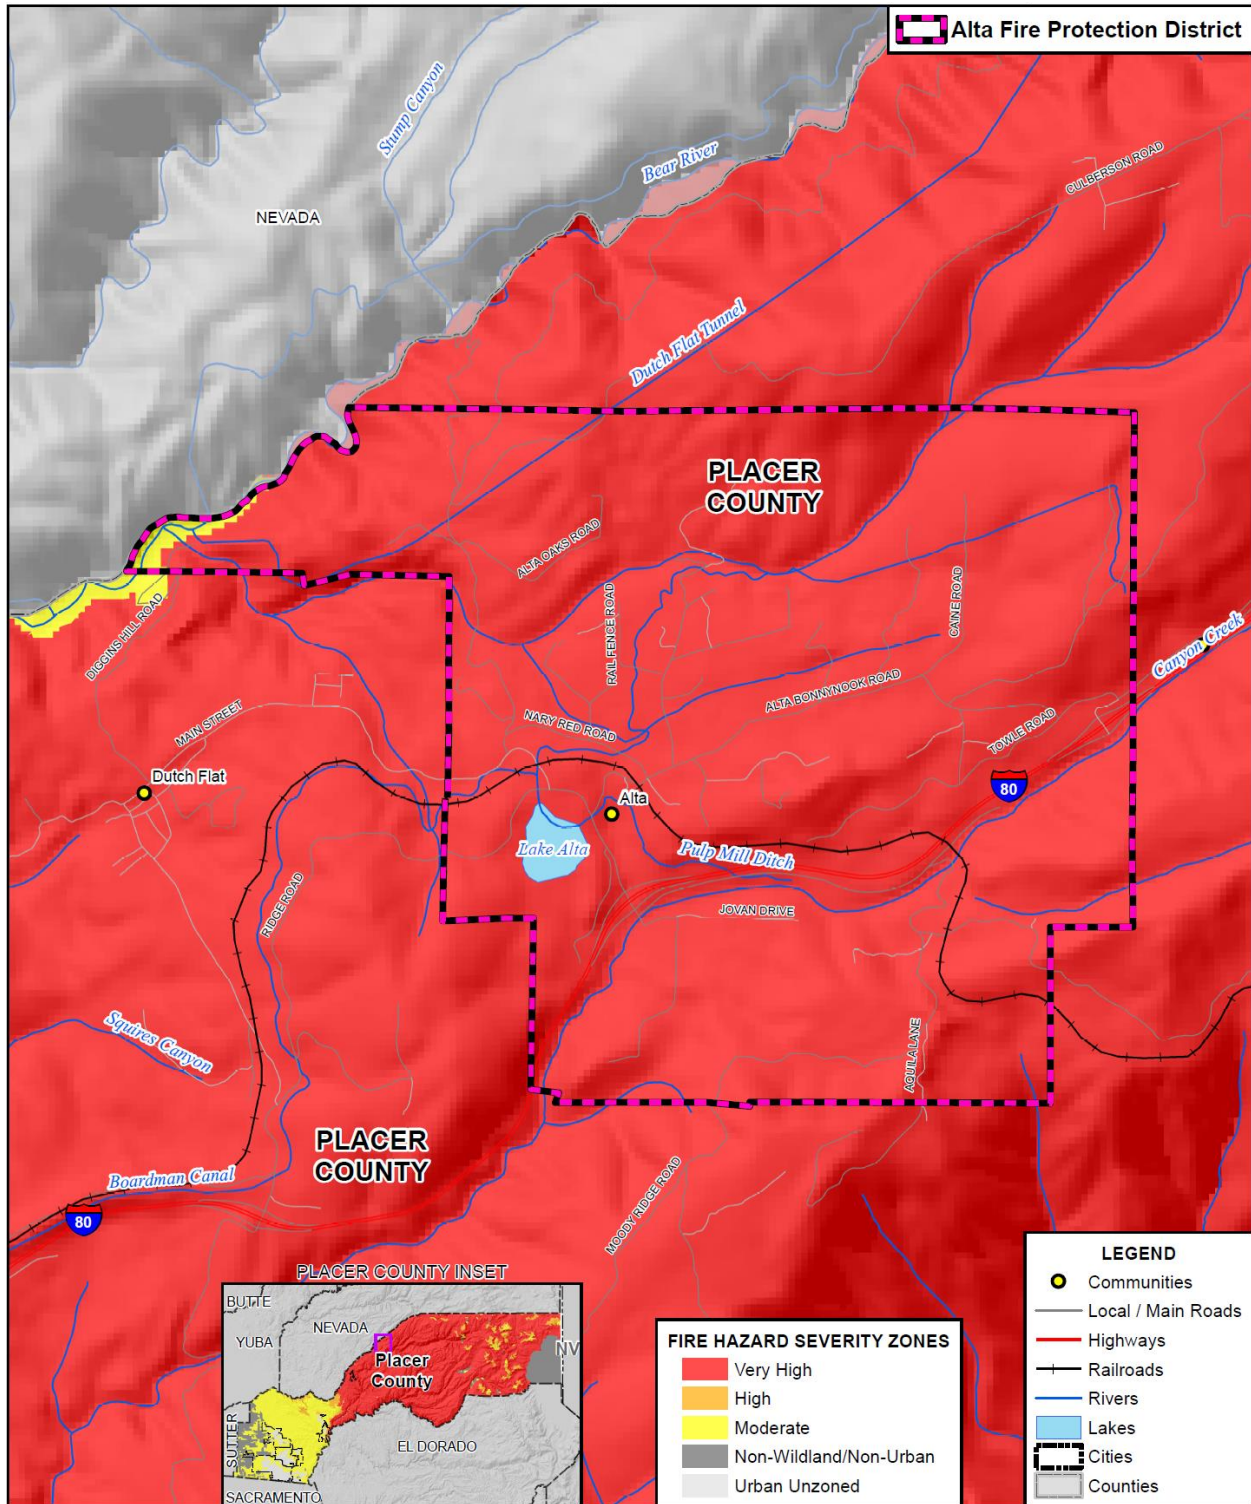

Wildland fire and the risk of a conflagration is an ongoing concern for the AFPD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

All of the communities that the Alta FPD is responsible for or provide mutual aid to are listed on the National Fire Plan’s “Communities at Risk” list. These include the communities of Alta, Dutch Flat, Casa Loma, Emigrant Gap, and Gold Run.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the AFPD were created. Figure F-2 shows the CAL FIRE FHSZ in the District. As shown on the maps, FHSZs within the District range from Moderate to Very High.

Figure F-2 AFPD – Fire Hazard Severity Zones

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table F-7.

Table F-7 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

The District noted it was affected by the following wildfires:

June 2008 Government Springs Fire (part of the American River Complex Fire) – The American River Complex started during the June 21 lightning storm as a series of 9 fires within the American River drainage area in Placer County. While 5 fires were contained within 24 hours, four fires threatened the communities of Foresthill, Baker Ranch and Michigan Bluff. With moderate to rapid fire spread, the Peavine Fire was expected to double in size while the Government Springs Fire was expected to triple in size. The Westville Fire eventually merged with the Government Springs Fire. Smoke created health issues affecting the community of Foresthill. The fires burned for over five weeks and charred over 20,000 acres and cost over \$23 million to fight. 2 residential structures were destroyed; no fatalities occurred.

July 2015 Alta Lowell Fire – Dry vegetation, low humidity and high temperature caused a fire to start on Lowell Hill Rd just on the other side of the Bear River from Alta, CA. The fire burned approximately 4,000 acres and destroyed one structure. At least 4 injuries (2 CalFire and 2 US Forest Service employees). Roads were closed for safety. Mandatory evacuations were in effect for Red Dog Road East of Greenhorn Creek, You Bet Road East of Greenhorn Creek, Chalk Bluff, and Lowell Hill Roads. An evacuation advisory was in place for the Cascade Shores Community. While no fires or spot fires related these incidents occurred in the District, the Alta Fire Protection District did provide support in the form of equipment and staff to help in firefighting efforts.

Figure F-3 Alta Lowell Fire Perimeter

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially

catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

The District has experienced direct wildfire threat annually, often deriving from the North Fork of the American River canyon, which experiences heavy recreational usage. The landscape along this canyon is densely vegetated and exists in a mixed mosaic of ownerships which makes landscape scale fuel reduction difficult. The District is also intersected by Highway 80 and the Union Pacific railroad, both of which increase the probability of roadside, railway ignition sources. The most recent threat to the community of Alta was the 2015 Lowell fire that burned 2,304 acres of forestland. The District is actively working with the community to install shaded fuel breaks in strategic locations.

Assets at Risk

As shown on the map in Figure F-2, all District assets from Table F-4 are at risk to wildfire.

F.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

F.6.1. Regulatory Mitigation Capabilities

Table F-8 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the AFPD.

Table F-8 AFPD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	N/A	N/A
Capital Improvements Plan	N	N/A
Economic Development Plan	N/A	N/A
Local Emergency Operations Plan	Y / Ongoing	Alta Fire Protection District's Community Center is a certified evacuation center with FEMA, is an alternate evacuation location for the Alta Dutch Flat Elementary School and a Community Resource Center utilized by PG&E during PSPS events for residents of the Alta Fire Protection District and surrounding communities.
Continuity of Operations Plan	Y / Ongoing	A mutual aid agreement with Placer County Fire / Cal Fire provides continuity of service for fire and life safety in the Alta Fire Protection District
Transportation Plan	N/A	N/A
Stormwater Management Plan/Program	N/A	N/A
Engineering Studies for Streams	N/A	N/A
Community Wildfire Protection Plan	Y / 2012	Western Placer Community Wildfire Protection Plan. Yes, the plan identifies hazards and contains a list of mitigation projects that is reviewed annually.
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	N
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Y	Enforced by Placer County
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	Y	Rating: 6Y
Site plan review requirements	N	
Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
Zoning ordinance	N/A	Responsibility of Placer County
Subdivision ordinance	N/A	Responsibility of Placer County

Floodplain ordinance	N/A	Responsibility of Placer County
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N/A	Responsibility of Placer County
Flood insurance rate maps	N/A	Responsibility of Placer County
Elevation Certificates	N/A	Responsibility of Placer County
Acquisition of land for open space and public recreation uses	N/A	Responsibility of Placer County
Erosion or sediment control program	N/A	Responsibility of Placer County
Hazardous Fuel Abatement program	Y	Responsibility of Placer County
How can these capabilities be expanded and improved to reduce risk?		
The hazardous fuel abatement program adopted by Placer County is designed to give Alta Fire Protection District residents, who are required to meet the CalFire guidelines for Defensible Space an avenue to get non-conforming properties who fail to meet those standards a way of getting the property owners of those properties to clear vegetation required for the 100ft defensible space program. It has not been determined if the program has yet to be effective.		

Source: AFD

The residents within the Alta Fire Protection District have worked to create a Firewise Community over the last 2 years and part of that process work on fuels reduction for properties in the District. The CWPP is managed by the Placer County Fire Safe Council, and a number of shaded fuel breaks have been created in and around the Alta Fire Protection District.

F.6.2. Administrative/Technical Mitigation Capabilities

Table F-9 identifies the District department(s) responsible for activities related to mitigation and loss prevention in AFD.

Table F-9 AFD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	Y	In coordination with Placer County
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	N	
Mutual aid agreements	Y	Coordination has been effective and a permanent long term solution is in process for the District to ensure 24/7 coverage for Emergency Services
Other		
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	Y	In coordination with Placer County
Floodplain Administrator	N	
Emergency Manager	Y	In coordination with Placer County

Community Planner	N	
Civil Engineer	Y	In coordination with Placer County
GIS Coordinator	Y	In coordination with Placer County
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	In coordination with Placer County
Hazard data and information	Y	In coordination with Placer County
Grant writing	Y	In coordination with Placer County
Hazus analysis	Y	Placer County GIS personnel.
Other		
How can these capabilities be expanded and improved to reduce risk?		
A formal agreement with Placer County Fire and CalFire to ensure continuity of services while maintaining and evacuation/community center and continuity of emergency services in coordination with a trained volunteer support role. This is in process and should be complete and in place by the end of 2022.		

Source: AFD

F.6.3. Fiscal Mitigation Capabilities

Table F-10 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table F-10 AFD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	N	N, N
Authority to levy taxes for specific purposes	N	N, N
Fees for water, sewer, gas, or electric services	N	N, N
Impact fees for new development	N	N, N
Storm water utility fee	N	N, N
Incur debt through general obligation bonds and/or special tax bonds	Y	Y (construction of existing fire department building) Not likely
Incur debt through private activities	N	N, N
Community Development Block Grant	N	N, N
Other federal funding programs	N	N, N
State funding programs	N	N, N
Other	Y	Local community fundraising Can be used in the future, with minimal income expected
How can these capabilities be expanded and improved to reduce risk?		

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
<p>Volunteers have been a key role in providing man hours for fundraisers, but even so, the amount of fundraising in a good year is less than \$10,000. There is not the population needed in the district to pull in more than 2,000-3,000 in an average year, funds need to be from outside sources. The process required for the district to implement fire fees for construction is not cost effective as a study of the fee structure must be audited every 5-10 years and the cost of the audit far exceeds any potential income to district given that most of the district is already at full build-out with only a few remaining vacant parcels still available for new construction.</p>		

Source: AFD

F.6.4. Mitigation Education, Outreach, and Partnerships

Table F-11 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table F-11 AFD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	Alta Fire Wise Community partnership Yes, this partnership could help implement mitigation activities.
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N	
Natural disaster or safety related school programs	Y	School programs are in place to teach wildfire protection plans and evacuations for students
StormReady certification	N	
Firewise Communities certification	Y	Process has been started in multiple AFD communities and for the district as a whole and is in progress
Public-private partnership initiatives addressing disaster-related issues	N	Agreement currently in place with PG&E for a community resource center during PSPS events
Other	Y	Inland waters hazmat trailer funded by Grant
<p align="center">How can these capabilities be expanded and improved to reduce risk?</p>		
<p>The District's agreement with PG&E for a community resource center helps to keep residents informed about PSPS related events. The establishment of an Alta Fire Wise Community is an educational and functional resource for residents to stay informed about how to create and maintain defensible space and where to go for assistance for the elderly and low-income residents.</p>		

Source: AFD

The Alta FPD has automatic aid agreements with bordering Districts and mutual aid agreements with other fire agencies throughout the area. The District relies heavily upon this aid from neighbors.

The District also works with other agencies on wildfire-related matters. Working with professional fire experts from the U.S. Forest Service and California Department of Forestry and Fire Protection helps ensure that the District's work complements state and federal work and is up to standard for controlling wildfires.

F.6.5. Other Mitigation Efforts

The District is involved in a variety of mitigation activities including public education, fuels management projects, and other activities to reduce fuel loads and fire risk. These mitigation activities include:

- **Public Education and Fire Safety**
 - ✓ A variety of public outreach activities are conducted throughout the district on an annual basis.
 - ✓ The District maintain an active educational presence in the community and the Alta – Dutch Flat School
 - ✓ The District also coordinates the use of the County Chipper for local fuel reduction activities.
- **Fuels Management Activities.**
 - ✓ The District has been partnering with Cal Fire and PG&E to actively pursue fuel reduction opportunities. Several miles of shaded fuel break and roadside shaded fuel break have been recently installed and efforts to extend these breaks continue.
 - ✓ The District has worked together with Cal Fire, the Placer County RCD and the USFS to plan and develop strategic fuel breaks that will protect the community. Federal, State and Private Grants continue to support the planning and implementation.
 - ✓ Cooperation between Caltrans and Cal Fire is resulting in fuels reduction work and demonstration of proper fuels reduction implementation.
- **Defensible Space**
 - ✓ In recent years due to lack of funding, the district has limited involvement in the enforcement of the defensible space program. When funding has been available, the District provides annual defensible space inspections of area residents.
 - ✓ The District currently operates an elderly assistance program where they coordinate volunteers to clear properties. This is now managed by the Sierra First Baptist Church who has connections with the elderly and disadvantaged members of the community.
- **Community Response**
 - ✓ The District's CERT team has disbanded due to loss of interest. The trained individuals were not utilized by Emergency Services on incidents outside the district, and the small call volume within the district meant the CERT Team members were exclusively training for events that did not occur or for which they were not called upon by Placer County.
 - ✓ The community has worked to create a Fire Wise Community which is working on educating the public on fire prevention and defensible space management.

F.7 Mitigation Strategy

F.7.1. Mitigation Goals and Objectives

The AFPD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

F.7.2. Mitigation Actions

The planning team for the AFPD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Climate Change
- Drought & Water Shortage
- Earthquake
- Floods: Localized Stormwater
- Landslides, Mudslides, and Debris Flows
- Severe Weather: Extreme Heat
- Severe Weather: Freeze and Snow
- Severe Weather: Heavy Rains and Storms
- Severe Weather: High Winds and Tornadoes
- Tree Mortality
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Reflective Addressing

Hazards Addressed: Multi-Hazard (Climate Change, Drought & Water Shortage, Earthquake, Floods: Localized Stormwater, Landslides, Mudslides, and Debris Flows, Severe Weather: Extreme Heat, Severe

Weather: Freeze and Snow, Severe Weather: Heavy Rains and Storms, Severe Weather: High Winds and Tornadoes, Tree Mortality, and Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: In the Alta Community many residences have long driveways or are down private roads in which the addresses are not well marked making it difficult for emergency responders to locate the location of an emergency.

Project Description: Provide an educational resource to residents of the importance of clearly and properly marking their address such that it is easily visible from the street and to provide address signs for purchase at low cost to the residents of the community.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Education at community events and/or by educational brochures and flyers located in public places in the community

Responsible Agency/ Department/Partners: Alta Fire Protection District / Alta Fire Wise Community

Cost Estimate: Less than \$50/property

Benefits (Losses Avoided): Decreased emergency response times for residents which generally leads to better medical aide and reduced property damages from fires.

Potential Funding: Grant, County and Private funding sources

Timeline: Ongoing

Project Priority (H, M, L): H

Action 2. Alta FireWise Community Established and Continuing

Hazards Addressed: Wildfire hazards

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Many residents in the community believe they have created defensible space but are unaware of many fire hazards that still exist to their property and that put their homes and/or their neighbors' homes at risk during a wildfire.

Project Description: Provide an educational resource to residents of the importance of properly creating defensible space for their homes and to educate them about their responsibility and requirements by law for them to ensure their neighbors are also able to meet the defensible space requirements. Provide a resource to help the elderly and disabled to create defensible space and to coordinate community projects for creating defensible space in public spaces such as the school, church and along roadways that are evacuation routes.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Education at community events and/or by educational brochures and flyers located in public places in the community

Responsible Agency/ Department/Partners: Alta Fire Protection District / Alta Fire Wise Community

Cost Estimate: Unknown

Benefits (Losses Avoided): Decrease the number acres burned and homes lost during wildfires in the community.

Potential Funding: Grant, County and Private funding sources

Timeline: Ongoing

Project Priority (H, M, L): H

Action 3. Apparatus Water Fill & Drafting Location Improvements

Hazards Addressed: Wildfire, Drought and Water Shortage, Climate Change

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Wildland and occasionally a structure fire requires an engine or water tender to travel as much as an hour round trip, plus time to refill the tanks. There are many locations where canals or lakes are much closer to the fire than a hydrant, but access to many of these locations is less than ideal for apparatus to access the canal or water source. In many of these locations, minor and low-cost alterations to a gate, access ramp or turnaround would allow an engine or water tender refill much closer to the fire location.

Project Description: Identify the potential sites along the I80 corridor between Colfax and Hwy 20 where minor or low-cost upgrades would allow for fire apparatus to draft water. Work with the agency that operates the water source for design and build of the upgrade.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: No existing mechanism.

Responsible Agency/ Department/Partners: Placer County Fire / CalFire / Alta Fire Protection District / Placer County Water Agency / Nevada Irrigation District / PG&E

Cost Estimate: Unknown

Benefits (Losses Avoided): Reduction in burned acreages from wildfires and reduced damage from structural fires

Potential Funding: Operating agencies, partners, grants and other unknown sources

Timeline: 2-5 years

Project Priority (H, M, L): M

Action 4. *Emergency Communications and Information System Improvements (HAM Radio and GMRS communications)*

Hazards Addressed: Multi-Hazard (Climate Change, Drought & Water Shortage, Earthquake, Floods: Localized Stormwater, Landslides, Mudslides, and Debris Flows, Severe Weather: Extreme Heat, Severe Weather: Freeze and Snow, Severe Weather: Heavy Rains and Storms, Severe Weather: High Winds and Tornadoes, Tree Mortality, and Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The topography in the mountain communities along the Interstate 80 corridor are such that communications via radio can be difficult. Radio signals generally require line of sight from the communications device to the communications tower/repeater. More tower/repeater locations or upgrades to existing tower/repeater locations can greatly improve the ability for emergency responders to communicate with mobile communication devices.

Project Description: Identify and build or upgrade communication sites to improve mobile communications for communities along the Interstate 80 corridor from Colfax to Highway 20.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Unknown

Responsible Agency/ Department/Partners: Alta Fire Protection District / Fire Wise communities / Placer County / CalFire

Cost Estimate: Unknown

Benefits (Losses Avoided): Increased mobile communications ability will increase the resources needed by emergency responders to request additional resources and provide for a safer work environment.

Potential Funding: Grant, County and Private funding sources

Timeline: Ongoing

Project Priority (H, M, L): H

Action 5. *Evacuation / Reunification Center Improvements*

Hazards Addressed: Multi-Hazard (Climate Change, Drought & Water Shortage, Earthquake, Floods: Localized Stormwater, Landslides, Mudslides, and Debris Flows, Severe Weather: Extreme Heat, Severe

Weather: Freeze and Snow, Severe Weather: Heavy Rains and Storms, Severe Weather: High Winds and Tornadoes, Tree Mortality, and Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Having a large safe gathering location where information meetings and booths can be setup and where the students from the school can go off site if needed for emergency requiring an evacuation and/or a reunification process with family. The facility needed to have separate locations for parents and students for the reunification process, and the facility needed to have restrooms, kitchen and climate control (heat/ac).

Project Description: The Community center now has Heat/AC and during PSPS events a generator provided by PG&E. The project now is to determine what additional modifications and/or upgrades are needed and to find funding sources to cover the cost of the upgrades

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: Unknown

Responsible Agency/ Department/Partners: Alta Fire Protection District

Cost Estimate: Unknown

Benefits (Losses Avoided): Providing a safe and comfortable location for students and residents to congregate during emergencies

Potential Funding: Grant, County and Private funding sources

Timeline: Ongoing

Project Priority (H, M, L): M

Action 6. Home Hardening Education and Projects

Hazards Addressed: Wildfire hazards to homes and structures

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Many residents in the community believe that by reducing vegetation and creating defensible space are unaware of many fire hazards that still exist to their homes and that put their homes and/or their neighbors' homes at risk during a wildfire.

Project Description: Provide an educational resource to residents of the importance of properly hardening their homes against fire in addition to creating defensible space for their homes and to educate them about their responsibility and requirements by law for them to ensure their neighbors are also able to meet the defensible space requirements. Provide a resource to help the elderly and disabled to better prepare their homes for wildfire by helping harden their homes and create defensible space; to coordinate community

projects for hardening structures in public spaces such as the school, church and along roadways that are evacuation routes.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Education at community events and/or by educational brochures and flyers located in public places in the community

Responsible Agency/ Department/Partners: Alta Fire Protection District / Alta Fire Wise Community

Cost Estimate: Unknown

Benefits (Losses Avoided): Decrease the number acres burned and homes lost during wildfires in the community.

Potential Funding: Grant, County and Private funding sources

Timeline: Ongoing

Project Priority (H, M, L): H

Action 7. Natural Systems Protection / Community Fuel Breaks

Hazards Addressed: Wildfire, Drought and Water Shortage, Extreme Heat

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The poor forest management over the last 50 years has resulted in unnatural and excessive fuel loads for all fuel types. The topography also contributes to the speed at which fires spread.

Project Description: Creating fire breaks and shaded fuel breaks along natural fire barriers (i.e. Ridgetops, Rivers, lightly vegetated rocky slopes) to help slow the progression of wildfires.

Other Alternatives: Proper forest management to thin out the forest in its entirety.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Managed by Placer County Fire and Cal/Fire fuel reduction programs

Responsible Agency/ Department/Partners: Placer County / CalFire

Cost Estimate: To be determined

Benefits (Losses Avoided): Providing fuel breaks and shaded fuel breaks to allow firefighters more time to fight wildfires and reduce the required to create fire containment lines.

Potential Funding: Grant, County and Private funding sources

Timeline: Ongoing

Project Priority (H, M, L): H

Action 8. *Natural Systems Protection / Education and Awareness Programs*

Hazards Addressed: Multi-Hazard (Climate Change, Drought & Water Shortage, Earthquake, Floods: Localized Stormwater, Landslides, Mudslides, and Debris Flows, Severe Weather: Extreme Heat, Severe Weather: Freeze and Snow, Severe Weather: Heavy Rains and Storms, Severe Weather: High Winds and Tornadoes, Tree Mortality, and Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The poor forest management over the last 50 years has resulted in unnatural and excessive fuel loads for all fuel types resulting in larger and more severe fire behavior that does more damage to the forest than fires historically used to do.

Project Description: Educate residents about thinning their properties to create defensible space and help protect the forest on a larger scale.

Other Alternatives: Proper forest management to thin out the forest in its entirety.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Placer County Firesafe Council, Fire Wise Community programs, Placer County Outreach, CalFire Outreach

Responsible Agency/ Department/Partners: Placer County / CalFire / Alta Fire Wise Community / Placer County Fire Safe Council

Cost Estimate: Unknown

Benefits (Losses Avoided): Educating the public about forest thinning to reduce the acreages burned during wildfires and to reduce the number of structures destroyed during wildfires.

Potential Funding: Grant, County and Private funding sources

Timeline: Ongoing

Project Priority (H, M, L): H

Annex G Alpine Springs County Water District

G.1 Introduction

This Annex details the hazard mitigation planning elements specific to the Alpine Springs County Water District (ASCWD or District), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to the Alpine Springs County Water District, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

G.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table G-1. Additional details on plan participation and District representatives are included in Appendix A.

Table G-1 Alpine Springs County Water District – Planning Team

Name	Position/Title	How Participated
Joe Mueller	District Manager	Reviewed and provided information and edits to Annex.
Miguel Ramirez	Operations Supervisor	Provided input on past hazards, current field conditions and utility system operations, facilities, and equipment available for emergency use.

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the District integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the District incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table G-2.

Table G-2 2016 LHMP Incorporation

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
N/A	No Hazard or mitigation related planning mechanisms have been completed since 2016

G.3 District Profile

The District profile for the Alpine Springs County Water District is detailed in the following sections. Figure G-1 displays a map and the location of the District within Placer County.

Figure G-1 Alpine Springs County Water District

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

G.3.1. Overview and Background

The Alpine Springs County Water District is located in Alpine Meadows just northwest of Lake Tahoe, along California State Highway 89, just outside of the Lake Tahoe Basin. The Alpine Meadows area encompasses approximately one square mile within Placer County and contains about 770 private parcels, interspersed among a few open space parcels. Bear Creek runs through the community, creating a riparian area near many of the homes. Most homes are situated along the creek or other riparian areas. The elevation of Alpine Meadows ranges from 6,185 feet at the mouth of the canyon to 6,835 feet at the ski area lodge and the top of the inhabited area. Mountain peaks above the community are at 8,637 feet. The private lands are surrounded by United States Forest Service (USFS) owned lands. The Alpine Meadows Ski Area is on USFS lands and is operated under a seasonal use agreement.

The Alpine Springs County Water District provides water, sewer, fire protection, parks, and garbage service to the residents of Alpine Meadows. The mission of Alpine Springs County Water District is to serve the residents of Alpine Meadows with:

- Adequate, safe, dependable drinking water and fire flow to meet community needs;
- Safe, efficient and non-hazardous collection of wastewater and refuse;
- Adequate and dependable fire protection services;
- Protection, preservation and enhancement of the urban forest setting with consideration for the property owner's continued use and enjoyment; and
- Offer recreation services and facilities serving all age groups.

G.4 Hazard Identification

The Alpine Springs County Water District identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table G-3).

Table G-3 Alpine Springs County Water District—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Limited	Unlikely	Negligible	Low	Medium
Avalanche	Significant	Likely	Limited	High	Medium
Climate Change	Extensive	Likely	Limited	Medium	Medium
Dam Failure	Limited	Unlikely	Negligible	Low	Medium
Drought & Water Shortage	Extensive	Likely	Limited	Medium	High
Earthquake	Extensive	Likely	Catastrophic	High	Low
Floods: 1%/0.2% annual chance	Limited	Occasional	Limited	Medium	Medium
Floods: Localized Stormwater	Limited	Occasional	Limited	Medium	Medium
Landslides, Mudslides, and Debris Flows	Limited	Occasional	Limited	Medium	Medium
Levee Failure	Limited	Unlikely	Negligible	Low	Medium
Pandemic	Limited	Occasional	Negligible	High	Medium
Seiche	Limited	Unlikely	Negligible	Low	Medium
Severe Weather: Extreme Heat	Limited	Unlikely	Negligible	Low	High
Severe Weather: Freeze and Snow	Extensive	Likely	Limited	Medium	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Occasional	Catastrophic	High	Medium
Severe Weather: High Winds and Tornadoes	Extensive	Likely	Limited	Medium	Low
Tree Mortality	Significant	Likely	Negligible	Medium	High
Wildfire	Extensive	Occasional	Catastrophic	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

G.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District’s hazards and assess the District’s vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

G.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 0, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table G-3) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

G.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District’s total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the Alpine Springs County Water District’s assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table G-4 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. Alpine Springs County Water District’s physical assets, valued at over \$7.1 million, consist of the buildings and infrastructure to support the District’s operations.

Table G-4 Alpine Springs County Water District Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
Horizontal Well 1	Water Supply	\$100,000	wildfire, earthquake, landslide
Horizontal Well 2	Water Supply	\$150,000	wildfire, earthquake, landslide
Horizontal Well 3	Water Supply	\$150,000	earthquake, landslide wildfire
Horizontal Well 4	Water Supply	\$150,000	wildfire
Vertical Well R-1	Water Supply	\$550,000	earthquake, wildfire
Vertical Well R-2	Water Supply	\$550,000	earthquake, wildfire
AME Well	Water Supply	\$755,850	wildfire
Storage Tank 1	Water Storage Tank	\$175,000	wildfire, earthquake
Storage Tank 2	Water Storage Tank	\$175,000	wildfire, earthquake
Storage Tank 3	Water Storage Tank	\$175,000	wildfire, earthquake
Storage Tank 5	Water Storage Tank	\$175,000	wildfire, earthquake
Storage Tank 4 A	Water Storage Tank	\$1,800,000	wildfire, earthquake
Office Building	Administrative Office	\$500,000	wildfire, earthquake
Shop & Vehicle Storage Building	Utility, Shop & Vehicle Storage Building	\$870,000	wildfire, earthquake
Fire House	Fire Station	\$825,000	wildfire, earthquake
Standby Generator	Standby Generator	\$55,000	wildfire, earthquake
Total		\$7,155,850	

Source: Alpine Springs County Water District

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. ASCWD provides services to an estimated permanent population of approximately 500

residents. This includes four commercial centers, a 30-unit apartment complex, 462 single-family homes, and 130 condominiums. In addition to permanent residents, ASCWD serves a substantial number of seasonal and part-time residents, short-term rentals, and day visitors.

Natural Resources

Alpine Springs County Water District has a variety of natural resources of value to the District. These natural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

In 2006, a wildlife and habitat analysis was done within the District boundaries to evaluate the potential for sensitive animal and plant species to be present. The results of the assessment indicate that areas within the District boundaries have the potential for the following:

- The mountain yellow-legged frog (*Rana muscosa*, which is federally listed as endangered);
- The willow flycatcher (*Empidonax traillii*, which is State listed as endangered);
- The northern goshawk (*Accipiter gentilis*, which is not listed);
- The Sierra Nevada mountain beaver (*Aplodontia rufa californica*, which is not listed);
- The Sierra marten (*Martes Americana sierrae*, which is not listed); and
- The western white-tailed jackrabbit (*Lepus townsendii*, which is not listed).

Historic and Cultural Resources

Alpine Springs County Water District has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Alpine Meadows is a popular ski resort and summer recreational area that also holds over 650 private residences, another 100 private parcels, and a few open space parcels. Most existing homes are situated along Bear Creek or other riparian areas. Multiple organizations own these private lands and are responsible for future development. The private lands are surrounded by USFS owned lands. As such, additional growth is limited to the private lands within the District boundaries.

Development since 2016

In 2018 water storage tank 4 and tank 4A was replaced with a new 870,000 gallon tank 4. The District continues to have preventative and corrective maintenance on all facilities.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. Numerous developers are currently in the

planning process for multi single family home developments within ASCWD service area. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

G.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table G-3 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Avalanche

Likelihood of Future Occurrence—Likely

Vulnerability—High

Hazard Profile and Problem Description

According to the Sierra Avalanche Center, avalanches occur when loading of new snow increases stress at a rate faster than strength develops, and the slope fails. Avalanches are a rapid down-slope movement of snow, ice and debris triggered by ground shaking, sound, or human or animal movement. Avalanches consist of a starting zone where the ice or snow breaks loose, a track which is the grade or channel the debris slides down and a run-out zone where the snow is deposited.

Critical stresses develop more quickly on steeper slopes and where deposition of wind-transported snow is common. The vast majority of avalanches occur during and shortly after storms. This hazard generally affects a small number of people, such as snowboarders, skiers, and hikers who venture into backcountry areas during or after winter storms. Roads and highway closures, damaged structures, and destruction of forests are also a direct result of avalanches.

Location and Extent

The two primary factors impacting avalanche activity are weather and terrain. Large, frequent storms deposit snow on steep slopes to create avalanche hazards. Additional factors that contribute to slope stability are the amount of snow, rate of accumulation, moisture content, wind speed and direction and type of snow crystals. Topography also plays a vital role in avalanche dynamics. Slope angles between 30 to 45 degrees are optimal for avalanches. The risk of avalanches decreases on slope angles below 30 degrees. At 50 or more degrees they tend to produce sluff or loose snow avalanches that account for only a small percentage of avalanche deaths and property damage annually.

Areas prone to avalanche hazards include hard to access areas deep in the backcountry and those in the more developed higher elevations of the County in the Tahoe basin. Avalanche hazards exist in eastern Placer County where combinations of the above criteria occur. The District services Alpine Meadows, a large ski resort located on both private and USFS lands. According to the Placer County Emergency Operations Plan, areas of particular concern include the Alpine Meadows and Bear Creek area.

Past Occurrences

There have been no state or federal disasters in the County related to avalanche. However, the District has experienced notable avalanches.

- In 1982, a 30-foot wall of snow plowed through the Alpine Meadows ski lodge and other ancillary buildings at 80 mph, killing seven people.
- On January 18, 2020, one man was killed and another man was seriously injured by an avalanche near the Subway ski run at Alpine Meadows.

Vulnerability to and Impacts from Avalanche

Avalanches occur when the weight of new snow increases stress faster than strength of the snowpack develops, causing the slope to fail. Avalanche conditions develop more quickly on steeper slopes (located in the eastern portions of the County) and where wind-blown snow is common. Avalanche impacts vary, but include risk to property, injury, or death. Avalanches generally affect a few snowboarders, skiers, and hikers who venture into backcountry areas during or after winter storms. Avalanches cause road closures, and can damage structures and forests.

Given the known potential for avalanches in the area, avalanche areas have been well defined and avalanche control work is conducted as needed on a regular basis. Additional mitigation measures are in place through county ordinances and the building permit process.

Assets at Risk

Facilities from Table G-4 at risk from this hazard, Horizontal Wells 1 through 4, and Storage tanks 1 through 5.

Climate Change

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Climate change adaptation is a key priority of the State of California. The 2018 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state’s infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Location and Extent

Climate change is a global phenomenon. It is expected to affect the whole of the District, Placer County, and State of California. There is no scale to measure the extent of climate change. Climate change exacerbates other hazards, such as drought, extreme heat, flooding, wildfire, and others. The speed of onset of climate change is very slow. The duration of climate change is not yet known, but is feared to be tens to hundreds of years.

Past Occurrences

Climate change has never been directly linked to any declared disasters. While the District noted that climate change is of concern, no specific impacts of climate change could be recalled. The District and HMPC members did, however, note that in Placer County, the strength of storms does seem to be increasing and the temperatures seem to be getting hotter.

Vulnerability to and Impacts from Climate Change

The California Adaptation Planning Guide (APG) prepared by California OES and CNRA was developed to provide guidance and support for local governments and regional collaboratives to address the unavoidable consequences of climate change. California’s APG: Understanding Regional Characteristics has divided California into 11 different regions based on political boundaries, projected climate impacts, existing environmental setting, socioeconomic factors and regional designations. Placer County falls within the North Sierra Region characterized as a sparsely settled mountainous region where the region’s economy is primarily tourism-based. The region is rich in natural resources, biodiversity, and is the source for the

majority of water used by the state. This information can be used to guide climate adaptation planning in the District and Placer County Planning Area.

The California APG: Understanding Regional Characteristics identified the following impacts specific to the North Sierra region in which the Placer County Planning Area is part of:

- Temperature increases
- Decreased precipitation
- Reduced snowpack
- Reduced tourism
- Ecosystem change
- Sensitive species stress
- Increased wildfire

Assets at Risk

The District noted that all its facilities from Table G-4 are at risk from climate change.

Drought & Water Shortage

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area’s usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table G-5.

Table G-5 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

A major portion of the Districts’ water supply is produced from horizontal wells located at an elevation above the Districts’ service area. The source of water supply for these horizontal is water store in the mountains above the wells. The wells have not shown any major reduction in production (about 6 to 8%)

during the recent drought. If the horizontal wells were to lose production the other source of supply would be from deep vertical wells located at the bottom, or lowest elevation in the service area. These wells are not equipped to pump water to any of the three higher water service zones within the District. Any loss of production in the higher elevation horizontal wells would leave approximately 75% of the Districts' water customer out of water.

Assets at Risk

No District assets (from Table G-4) are at risk from this hazard.

Earthquake

Likelihood of Future Occurrence–Likely

Vulnerability–High

Hazard Profile and Problem Description

An earthquake is caused by a sudden slip on a fault. Stresses in the earth's outer layer push the sides of the fault together. Stress builds up, and the rocks slip suddenly, releasing energy in waves that travel through the earth's crust and cause the shaking that is felt during an earthquake. Earthquakes can cause structural damage, injury, and loss of life, as well as damage to infrastructure networks, such as water, power, gas, communication, and transportation. Earthquakes may also cause collateral emergencies including dam and levee failures, seiches, hazmat incidents, fires, avalanches, and landslides. The degree of damage depends on many interrelated factors. Among these are: the magnitude, focal depth, distance from the causative fault, source mechanism, duration of shaking, high rock accelerations, type of surface deposits or bedrock, degree of consolidation of surface deposits, presence of high groundwater, topography, and the design, type, and quality of building construction.

Location and Extent

The amount of energy released during an earthquake is usually expressed as a magnitude and is measured directly from the earthquake as recorded on seismographs. An earthquake's magnitude is expressed in whole numbers and decimals (e.g., 6.8). Seismologists have developed several magnitude scales, as discussed in Section 4.3.11 of the Base Plan. Placer County itself is traversed by a series of northwest-trending faults, called the Foothill Fault Zone, that are related to the Sierra Nevada uplift. This was the source of Oroville's 1975 earthquake (and an earlier event in the 1940s). Earthquakes on nearby fault segments in the Foothill Fault Zone could be the source of ground shaking in the Placer County Planning Area. Although portions of western and eastern Placer County are located in a seismically active region, no known faults actually go through any of the cities or towns.

Another measure of earthquake severity is intensity. Intensity is an expression of the amount of shaking at any given location on the ground surface. Seismic shaking is typically the greatest cause of losses to structures during earthquakes. The seismic hazard within the ASCWD service area is relatively low compared to many other parts of California. However, the area is considered to have a higher risk of an earthquake occurring due to the presence of several faults systems located in the area. The shaking potential is greatest in the eastern portion of the County, including the ASCWD service area.

Past Occurrences

There have been no past federal or state disaster declarations in Placer County from this hazard. The District noted no past occurrences of earthquakes or that affected the District in any meaningful way.

Vulnerability to and Impacts from Earthquake

The combination of plate tectonics and associated California coastal mountain range building geology generates earthquake as a result of the periodic release of tectonic stresses. Placer County lies in the center of the North American and Pacific tectonic plate activity. There have been earthquakes as a result of this activity in the historic past, and there will continue to be earthquakes in the future of the California north coastal mountain region.

Fault ruptures itself contributes very little to damage unless the structure or system element crosses the active fault; however, liquefaction can occur further from the source of the earthquake. In general, newer construction is more earthquake resistant than older construction due to enforcement of improved building codes. Manufactured buildings can be very susceptible to damage because their foundation systems are rarely braced for earthquake motions. Locally generated earthquake motions and associated liquefaction, even from very moderate events, tend to be more damaging to smaller buildings, especially those constructed of unreinforced masonry (URM) and soft story buildings. The District noted that there are no URM or soft story buildings in the District.

The Uniform Building Code (UBC) identifies four seismic zones in the United States. The zones are numbered one through four, with Zone 4 representing the highest level of seismic hazard. The UBC establishes more stringent construction standards for areas within Zones 3 and 4. All of California lies within either Zone 3 or Zone 4. The Alpine Springs County Water District is within the less hazardous Zone 3.

Impacts from earthquake in the District will vary depending on the fault that the earthquake occurs on, the depth of the earthquake strike, and the intensity of shaking. Large events could cause damages to infrastructure, critical facilities, residential and commercial properties, and possible injuries or loss of life. There may be a lack of un-reinforced masonry buildings, compared to a more urban setting, however the ASCWD service area water storage tanks are circular prestressed concrete. In a report prepared for the ASCWD in 2013 by DN Tanks, the tanks do not meet design criteria, especially seismic criteria. The impact of an earthquake upon these water storage tanks would be very vulnerable to damage from severe ground shaking.

Assets at Risk

The District noted that all its facilities from Table G-4 are at risk from earthquake.

Flood: 1%/0.2% Annual Chance

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

This hazard analyzes the FEMA DFIRM 1% and 0.2% annual chance floods. These tend to be the larger floods that can occur in the County or in the District, and have caused damages in the past. Flooding is a significant problem in Placer County and the District. Historically, the District has been at risk to flooding primarily during the winter and spring months when river systems in the County swell with heavy rainfall and snowmelt runoff. Normally, storm floodwaters are kept within defined limits by a variety of storm drainage and flood control measures. Occasionally, extended heavy rains result in floodwaters that exceed normal high-water boundaries and cause damage.

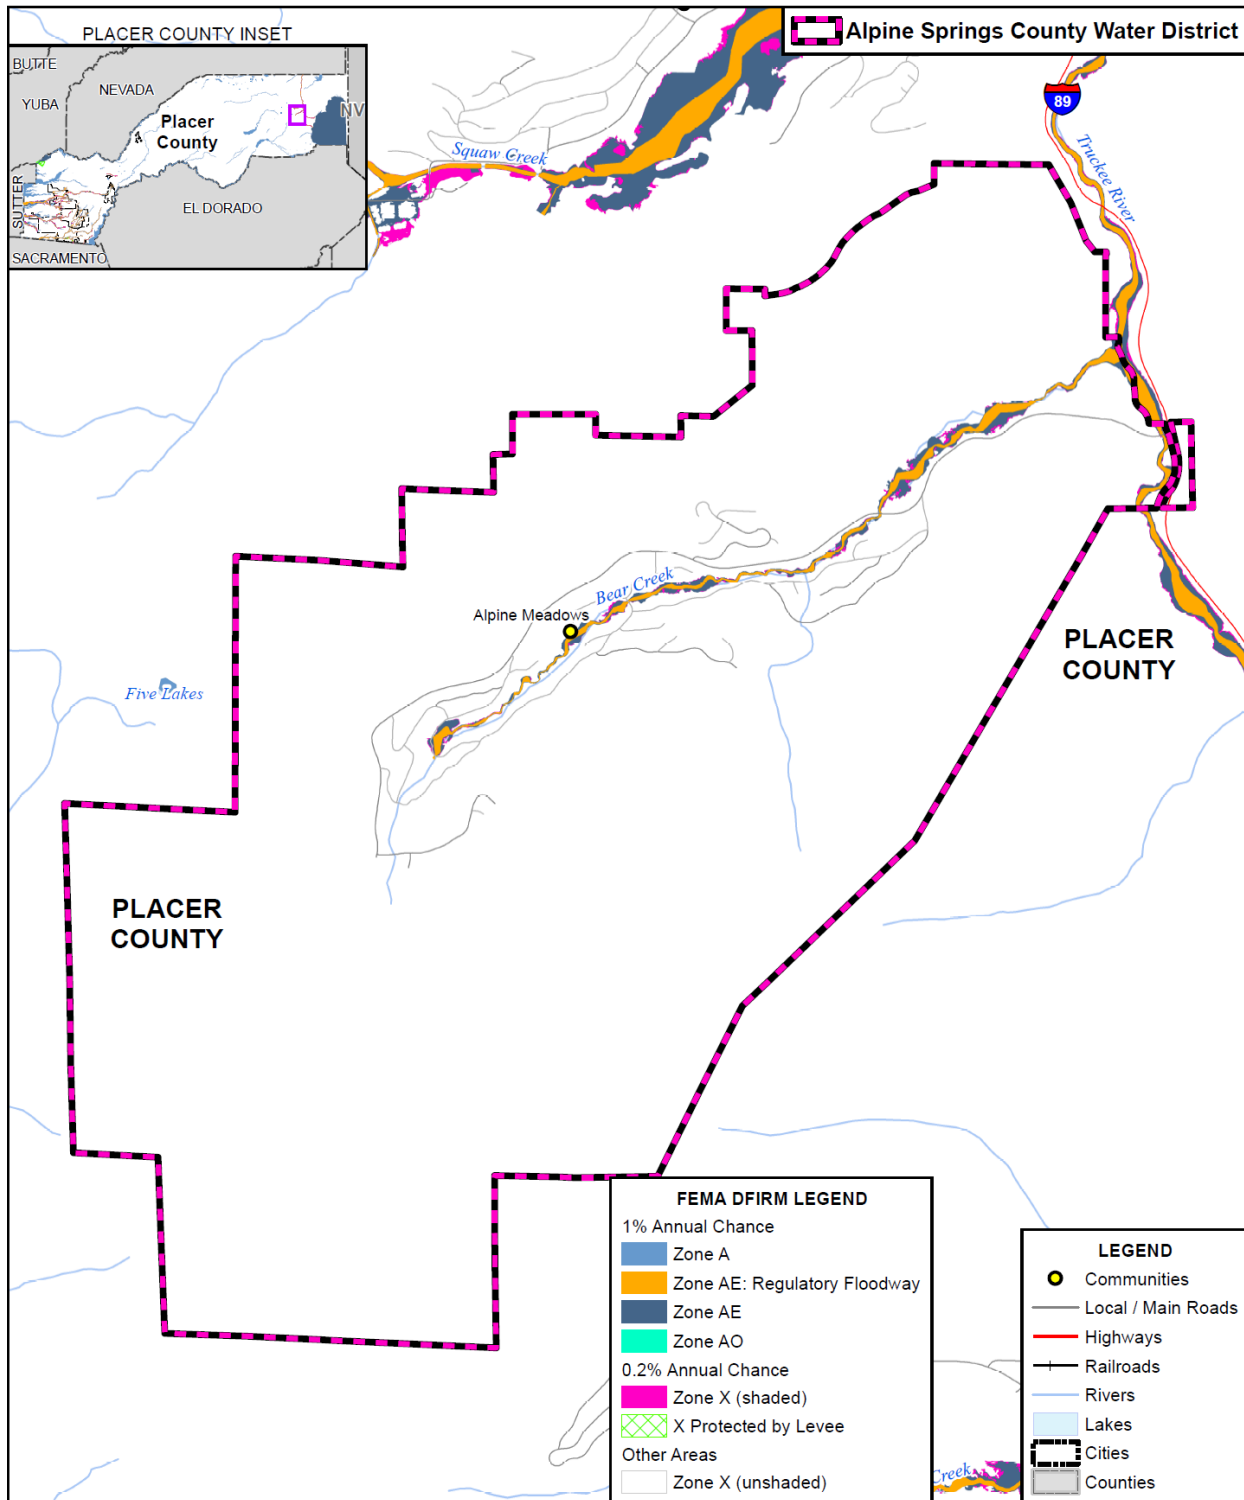

Bear Creek is the main drainage channel which runs the length of Alpine Meadows. The channel is fairly well defined and would be subject to flooding in selected area during a 1% or 0.2% annual chance flood event. The creek does have several crossings of local streets which are privately maintained. Based upon observations of these crossing it would appear that one or more of these creek crossing would be subject to wash out during a 1% or 0.2% annual chance flood event. The District is not aware of any specific studies which would confirm that flooding would or would not occur.

As previously described in Section 4.3.12 of the Base Plan, the Placer County Planning Area and the Alpine Springs County Water District have been subject to historical flooding.

Location and Extent

The Alpine Springs County Water District has areas located in the 1% and 0.2% annual chance floodplain. This is seen in Figure G-2.

Figure G-2 Alpine Springs County Water District – FEMA DFIRM Flood Zones

Data Source: FEMA DFIRM 11/2/2018, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Table G-6 details the DFIRM mapped flood zones within the 1% annual chance flood zone as well as other flood zones located within the District.

Table G-6 Alpine Springs County Water District– DFIRM Flood Hazard Zones

Flood Zone	Description	Flood Zone Present in the District
A	Areas subject to inundation by the 1% annual-chance flood event generally determined using approximate methodologies. Because detailed hydraulic analyses have not been performed, no Base Flood Elevations (BFEs) or flood depths are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	
AE	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE – Regulatory Floodway	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply. Different from AE in that it adds the water course and adjacent lands that must be reserved in order to discharge the base flood without increasing the water surface elevation by more than one foot.	X
AH	An area inundated by 1% annual chance flooding (usually an area of ponding), for which BFEs have been determined; flood depths range from 1 to 3 feet	
AO	Areas subject to inundation by 100-year shallow flooding (usually sheet flow on sloping terrain) where average depths are between one and three feet	
Shaded X	500-year flood the areas between the limits of the 1% annual chance flood and the 0.2-percent-annual-chance (or 500-year) flood	X
X Protected by Levee	An area determined to be outside the 500-year flood and protected by levee from 100-year flood	
X	Areas outside of known floodplains.	X

Source: FEMA

Additionally, flood extents can generally be measured in volume, velocity, and depths of flooding. Expected flood depths in the District vary, depending on the nature and extent of a flood event; specific depths are unknown. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Flooding in the District tends to have a shorter speed of onset, due to the amount of water that flows through the District.

Past Occurrences

A list of state and federal disaster declarations for Placer County from flooding is shown on Table G-7. These events also likely affected the District to some degree.

Table G-7 Placer County – State and Federal Disaster Declarations from Flood 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Flood (including heavy rains and storms)	16	1950, 1955, 1958 (twice), 1962, 1963, 1969, 1973, 1980, 1983, 1986, 1995 (twice), 1997, 2008, 2017	13	1955, 1958, 1962, 1964, 1969, 1983, 1986, 1995 (twice), 1997, 2006 (twice), 2017

Source: Cal OES, FEMA

Vulnerability to and Impacts from Flood

Floods have been a part of the District’s historical past and will continue to be so in the future. During winter months, long periods of precipitation and the timing of that precipitation are critical in determining the threat of flood, and these characteristics further dictate the potential for widespread structural and property damages. Predominantly, the effects of flooding are generally confined to areas near the waterways of the County. As waterways grow in size from local drainages, so grows the threat of flood and dimensions of the threat. This threatens structures in the floodplain. Structures can also be damaged from trees falling as a result of water-saturated soils. Electrical power outages happen, and the interruption of power causes major problems. Loss of power is usually a precursor to closure of governmental offices and community businesses. Roads can be damaged and closed, causing safety and evacuation issues. People may be swept away in floodwaters, causing injuries or deaths.

Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits. Direct impacts, such as drowning, can be limited with adequate warning and public education about what to do during floods. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, loss of environmental resources, and economic impacts.

Assets at Risk

The District noted that the AME Well, Office Building, Shop & Vehicle Storage building from Table G-4 are at risk from this hazard.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

Flooding occurs in areas other than the FEMA mapped 1% and 0.2% annual chance floodplains. Flooding may be from drainages not studied by FEMA, lack of or inadequate drainage infrastructure, or inadequate maintenance. Localized, stormwater flooding occurs throughout the County during the rainy season from November through April. Prolonged heavy rainfall contributes to a large volume of runoff resulting in high peak flows of moderate duration.

Location and Extent

ASCWD is subject to localized flooding throughout the District. Flood extents are usually measured in areas affected, velocity of flooding, and depths of flooding. Expected flood depths in the District vary by location. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Localized flooding in the District tends to have a shorter speed of onset, especially when antecedent rainfall has soaked the ground and reduced its capacity to absorb additional moisture.

Bear Creek is the main drainage channel which runs the length of Alpine Meadows, the District's service area. The Bear Creek channel crosses several different local street and roadways. Several of the crossings are within areas where the streets are privately maintained. During past events the streets have not been subject to over topping. Based upon visual observations of these crossing it would appear that one or more of these creek crossing would be subject to wash out during a major rain event. The District is not aware of any specific studies which would confirm that flooding would or would not occur.

Past Occurrences

Heavy rains occur on an annual basis in the District service area. Often during these events, the local stormwater drainage system can be impacted. However, the District did not identify any past events resulting in significant damage.

Vulnerability to and Impacts from Localized Flooding

Historically, much of the growth in the District and County has occurred adjacent to streams, resulting in significant damages to property, and losses from disruption of community activities when the streams overflow. Additional development in the watersheds of these streams affects both the frequency and duration of damaging floods through an increase in stormwater runoff.

Primary concerns associated with stormwater flooding include life safety issues, and impacts to property and to infrastructure that provides a means of ingress and egress throughout the community. Ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Objects can also be buried or destroyed through sediment deposition. Floodwaters can break

utility lines and interrupt services. Standing water can cause damage to crops, roads, and foundations. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

Assets at Risk

The District noted that all its facilities from Table G-4 are at limited risk from localized flooding.

Landslide, Mudslide, Debris Flows

Likelihood of Future Occurrence–Occasional

Vulnerability–Medium

Hazard Profile and Problem Description

According to the California Geological Survey (CGS), landslides refer to a wide variety of processes that result in the perceptible downward and outward movement of soil, rock, and vegetation under gravitational influence. Common names for landslide types include slump, rockslide, debris slide, lateral spreading, debris avalanche, earth flow, and soil creep. Landslides may be triggered by both natural and human-induced changes in the environment that result in slope instability.

The susceptibility of an area to landslides depends on many variables including steepness of slope, type of slope material, structure and physical properties of materials, water content, amount of vegetation, and proximity to areas undergoing rapid erosion or changes caused by human activities. These activities include mining, construction, and changes to surface drainage areas. Landslide events can be determined by the composition of materials and the speed of movement. A rockfall is dry and fast while a debris flow is wet and fast. Regardless of the speed of the slide, the materials within the slide, or the amount of water present in the movement, landslides are a serious natural hazard.

Debris flows, can also occur in some areas of the County and the District. These debris flows generally occur in the immediate vicinity of existing drainage swales or steep ravines. Debris flows occur when near surface soil in or near steeply sloping drainage swales becomes saturated during unusually heavy precipitation and begins to flow downslope at a rapid rate. Debris flows are also common during the rainy season in post fire areas.

Location and Extent

Landslides, mudslides, and debris flows can affect certain areas of the District. The CGS has estimated that the risk varies across the District and has created maps showing risk variance. This risk variance falls into multiple categories. These are discussed in Section 4.3.14 of the Base Plan. According to the District Planning Team, risk varies within the District range from low to high. The speed of onset of landslide is often short, especially in post-wildfire burn scar areas, but it can also take years for a slope to fail. Landslide duration is usually short, though digging out and repairing landslide areas can take some time.

Past Occurrences

There have been no federal or state disaster declarations in the County from landslide. There have been three landslides and debris flow events in the Alpine Meadows area. All events occurred in 1997. There was a landslide and debris flow out of East Gully which flow out of the gully and across Alpine Meadows Road. There was a landslide and debris flow event down an unnamed creek at the ski resort. The flow came down slope adjacent to the Kangaroo Lift. The flow entered the electric room and pump room of the ski resort. The third event was on the west side of Scott Peek. The event ran out without causing any damage.

Vulnerability to and Impacts from Landslide

Although landslides are primarily associated with slopes greater than 15 percent, they can also occur in relatively flat areas and as cut-and-fill failures, river bluff failures, lateral spreading landslides, collapse of wine-waste piles, failures associated with quarries, and open-pit mines. Landslides may be triggered by both natural- and human-caused activity.

Impacts in the District may be to structures, infrastructure, and to life safety. Impacts from landslide, mudslides and debris flow in the District include interruption of service and infrastructure damage. To date the district has not had any problems with landslides affecting its infrastructure.

Assets at Risk

The District noted that all its facilities from Table G-4 are at risk from this hazard.

Pandemic

Likelihood of Future Occurrence—Occasional
Vulnerability—High

Hazard Profile and Problem Description

According to the World Health Organization (WHO), a disease epidemic occurs when there are more cases of that disease than normal. A pandemic is a worldwide epidemic of a disease. A pandemic may occur when a new virus appears against which the human population has no immunity.

A pandemic occurs when a new virus emerges for which people have little or no immunity, and for which there is no vaccine. This disease spreads easily person-to-person, causes serious illness, and can sweep across the country and around the world in a very short time. The U.S. Centers for Disease Control (CDC) and Prevention has been working closely with other countries and the WHO to strengthen systems to detect outbreaks of that might cause a pandemic and to assist with pandemic planning and preparation. An especially severe pandemic could lead to high levels of illness, death, social disruption, and economic loss.

Location and Extent

During a pandemic, the whole of the District, County, and surrounding region is at risk, as pandemic is a regional, national, and international event. The speed of onset of pandemic is usually short, while the

duration is variable, but can last for more than a year as shown in the 1918/1919 Spanish Flu. There is no scientific scale to measure the magnitude of pandemic. Pandemics are usually measured in numbers affected by the pandemic, and by number who die from complications from the pandemic.

Past Occurrences

There has been one state and federal disaster declaration due to pandemic, as shown in Table G-8.

Table G-8 Placer County – State and Federal Pandemic Disaster Declarations 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Pandemic	1	2020	1	2020

Source: Cal OES, FEMA

The 20th century saw three outbreaks of pandemic flu.

- The 1918-1919 Influenza Pandemic (H1N1)
- The February 1957-1958 Influenza Pandemic (H2N2)
- The 1968 Influenza Pandemic (H3N2)

To date, the 21st century has seen two acknowledged pandemics.

- 2009 Swine Flu (H1N1)
- 2019/2020 COVID 19

In response to the initial outbreak of COVID-19 and subsequent shelter in place orders, District management quickly developed protocols to avoid the spread of disease. Due to the essential nature of the work the District performs, Staff were required to continue to report for duty in person.

Staff adapted guidelines to prevent the spread of COVID-19 and protect the health and safety of employees. All in office staff continued to adhere to cleaning, physical distancing and hand-washing guidelines.

District Board meetings were adapted to a virtual environment via Zoom and the office was and remains closed to the public.

The evolving nature of the pandemic demanded flexibility and adaptability of staff. Pandemic-related policies have been implemented and updated on a continual basis since the onset of COVID-19 and in accordance with federal, state and local laws. This required dedication and attention to several authorities for information to properly communicate, inform and educate staff.

The rate of infection within the District was negligible and there have been no staff to staff transmissions as of April 2021. The fiscal impacts on the District have been insignificant. The District did not reduce staff or pay throughout the pandemic.

Vulnerability to and Impacts from Pandemic

Pandemics have and will continue to have impacts on human health in the region. A pandemic occurs when a new virus emerges for which there is little or no immunity in the human population; the virus causes serious illness and spreads easily from person-to-person worldwide. There are several strategies that public health officials can use to combat a pandemic. Constant surveillance regarding the current pandemic, use of infection control techniques, and administration of vaccines once they become available. Citizens can help prevent the spread of a pandemic by staying home, or “self-quarantining,” if they suspect they are infected. Pandemic does not affect the buildings, critical facilities, and infrastructure in the District. Pandemic can have varying levels of impact to the citizens of the District and greater County, depending on the nature of the pandemic.

Impacts could range from school and business closings to the interruption of basic services such as public transportation, health care, and the delivery of food and essential medicines. Hospitalizations and deaths can occur, especially to the elderly or those with pre-existing underlying conditions. As seen with Covid-19, multiple businesses were forced to close temporarily (some permanently) and unemployment rose significantly. Supply chains for food and essentials can be interrupted. Prisons may need to release prisoners to prevent significant outbreaks.

Assets at Risk

Pandemics do not affect District facilities, but can affect District personnel who operate District facilities.

Severe Weather: Freeze and Snow

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to the NWS and the WRCC, winter snow storms can include heavy snow, ice, and blizzard conditions. Heavy snow can immobilize a region, stranding commuters, stopping the flow of supplies, and disrupting emergency and medical services. Accumulations of snow can collapse roofs and knock down trees and power lines. In less populated areas, homes and residents may be isolated for days. The cost of snow removal, damage repair, and business losses can have a tremendous impact on cities and towns.

Heavy accumulations of ice can bring down trees, electrical wires, telephone poles and lines, and communication towers. Communications and power can be disrupted for days until the damage can be repaired. Power outages can have a significant impact on communities, especially critical facilities such as public utilities. Even small accumulations of ice may cause extreme hazards to motorists and pedestrians.

Some winter storms are accompanied by strong winds, creating blizzard conditions with blinding wind-driven snow, severe drifting, and dangerous wind chills. Strong winds accompanying these intense storms and cold fronts can knock down trees, utility poles, and power lines. Blowing snow can reduce visibility to only a few feet in areas where there are no trees or buildings. Serious vehicle accidents with injuries and deaths can result.

Location and Extent

Freeze and snow are regional issues, meaning the entire District is at risk to cold weather and freeze events. While there is no scale (i.e. Richter, Enhanced Fujita) to measure the effects of freeze, the WRCC reports that in a typical year, minimum temperatures fall below 32°F on 209.0 days with 0.4 days falling below 0°F in eastern Placer County. Snowfall is measured in depths, and the WRCC reports that average snowfall on the eastern side of the County is 190.7 inches. Freeze and snow has a slow onset and can be generally be predicted in advance for the County. Freeze events can last for hours (in a cold overnight), or for days to weeks at a time. Snow event can last for hours or days, and the snow stays all winter in the eastern portion of the County, often with significant snow depths.

Past Occurrences

There has been no federal and one state disaster declarations in the County for freeze and snow, as shown on Table G-9.

Table G-9 Placer County – State and Federal Disaster Declarations from Freeze and Snow 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Freeze	1	1972	0	–

Source: Cal OES, FEMA

The District noted that cold and freeze is a regional phenomenon; events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.3.

The District reported one incident related to the winter snow season. In February of 2007, water service lines from the distribution main to service boxes froze, causing water service to be interrupted to five homes. The homeowners purchased bottled water for drinking and cooking and hauled water for toilet flushing. No other damages were reported. Incidents of this type will likely occur again during extreme periods of frigid temperatures during the winter season.

Vulnerability to and Impacts from Severe Weather: Freeze and Snow

The District experiences temperatures below 32 degrees during the winter months. Freeze can cause injury or loss of life to residents of the District. While it is rare for buildings to be affected directly by freeze, damages to pipes that feed building can be damaged during periods of extreme cold. Freeze and snow can occasionally be accompanied by high winds, which can cause downed trees and power lines, power outages, accidents, and road closures. Transportation networks, communications, and utilities infrastructure are the most vulnerable physical assets to impacts of severe winter weather in the County. However, because this area is home to a premier ski area, not only is an abundance of snow good for the economy, but the area has historically been developed to accommodate big snow seasons.

Effects to the District from cold and freeze are limited as infrastructure and facilities were constructed with severe mountain environment in mind. Sustained winter power outages of several days have been experienced in the past due to storm.

Assets at Risk

The District noted that all its facilities from Table G-4 are at risk from this hazard.

Severe Weather: Heavy Rains and Storms (Hail, Lightning)

Likelihood of Future Occurrence—Occasional

Vulnerability—High

Hazard Profile and Problem Description

Storms in the District occur annually and are generally characterized by heavy rain often accompanied by strong winds and sometimes lightning and hail. Approximately 10 percent of the thunderstorms that occur each year in the United States are classified as severe. A thunderstorm is classified as severe when it contains one or more of the following phenomena: hail that is three-quarters of an inch or greater, winds in excess of 50 knots (57.5 mph), or a tornado. Heavy precipitation, as snow (and sometimes rain), in the District falls mainly in the fall and spring months.

Location and Extent

Heavy rain events occur on a regional basis. Rains and storms can occur in any location of the District. All portions of the District are at risk to heavy rains. Most of the severe precipitation (rain or snow) occurs during the fall, winter, and spring months, within the eastern side of the County. There is no scale by which heavy rains and severe storms are measured. Magnitude of storms is measured often in rainfall and damages. The speed of onset of heavy rains can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of severe storms in California, Placer County, and the District can range from minutes to hours to days. Information on precipitation extremes can be found in Section 4.3.4 of the Base Plan.

Past Occurrences

There have been past disaster declarations from heavy rains and storms, which were discussed in Past Occurrences of the flood section above. According to historical hazard data, severe weather, including heavy rains and storms, is an annual occurrence in the District. This is the cause of many of the federal disaster declarations related to flooding. The District did not identify any past events resulting in significant damage.

Vulnerability to and Impacts from Heavy Rain and Storms

While precipitation as snow is predominant during the winter months, heavy rain and severe storms are among the most frequent type of severe weather occurrences in the District. These events can cause localized flooding. Elongated events, or events that occur during times where the ground is already

saturated can cause 1% and 0.2% annual chance flooding. Wind often accompanies these storms and has caused damage in the past. Hail and lightning are rare in the District.

Actual damage associated with the effects of severe weather include impacts to property, critical facilities (such as utilities), and life safety. Heavy rains and storms often result in localized flooding creating significant issues. Roads can become impassable and ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Floodwaters and downed trees can break utilities and interrupt services.

During periods of heavy rains and storms, power outages can also occur. These power outages can affect pumping stations and lift stations that help alleviate flooding. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Assets at Risk

The District noted that all its facilities from Table G-4 are at risk from this hazard.

Severe Weather: High Winds and Tornadoes

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

High winds, as defined by the NWS glossary, are sustained wind speeds of 40 mph or greater lasting for 1 hour or longer, or winds of 58 mph or greater for any duration. High winds can cause significant property and crop damage, threaten public safety, and have adverse economic impacts from business closures and power loss. High winds can also contribute to PSPS events.

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes form when cool, dry air sits on top of warm, moist air. Tornadoes are the most powerful storms that exist. Tornadoes, though rare, are another severe weather hazard that can affect areas of the Placer County Planning Area, primarily during the rainy season in the late fall, winter, and early spring.

Location and Extent

The entire District is subject to significant, non-tornadic (straight-line), winds. Each area of the County is at risk to high winds. Magnitude of winds is measured often in speed and damages. These events are often part of storm events, but can occur outside of storms. The speed of onset of winds can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of winds in California is often short, ranging from minutes to hours. The Beaufort scale is an empirical 12 category scale that relates wind speed to observed conditions at sea or on land. Its full name is the Beaufort Wind Force Scale. The Beaufort Scale was shown in Section 4.3.5 of the Base Plan.

Tornadoes, while rare, can occur at any location in the County and District. Prior to February 1, 2007, tornado intensity was measured by the Fujita (F) scale. This scale was revised and is now the Enhanced Fujita scale. Both scales are sets of wind estimates (not measurements) based on damage. The new scale (EF) provides more damage indicators (28) and associated degrees of damage, allowing for more detailed analysis and better correlation between damage and wind speed. It is also more precise because it considers the materials affected and the construction of structures damaged by a tornado. The F Scale and EF Scale are shown in Section 4.3.5 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for winds and tornadoes. The District did not identify any past events resulting in significant damage

Vulnerability to and Impacts from Severe Weather: Wind and Tornado

High winds are common occurrences in the District throughout the entire year. Straight line winds are primarily a public safety and economic concern. Windstorm can cause damage to structures and power lines which in turn can create hazardous conditions for people. Debris flying from high wind events can shatter windows in structures and vehicles and can harm people that are not adequately sheltered. High winds can impact critical facilities and infrastructure and can lead to power outages. Wind can also drive wildfire flames, spreading wildfires quickly. During periods of high winds and dry vegetation, wildfire risk increases. High winds that occur during periods of extreme heat can cause PSPS events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Impacts from high winds in the District will vary. Future losses from straight line winds include:

- Downed trees
- Power line impacts and economic losses from power outages
- Increased PSPS events
- Occasional building damage, primarily to roofs

Assets at Risk

The District noted that all its facilities from Table G-4 are at risk from this hazard.

Tree Mortality

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, and contribute to future fuel loads in forests surrounding communities. During extended drought, trees become more vulnerable and tree mortality is driven by a build-up in

endemic bark beetle populations and exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events.

Location and Extent

Onset of tree mortality events can be relatively fast; however conditions – such as drought and high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. CAL FIRE representatives in the County noted that Placer County is still in the infestation cycle in most of the WUI and will be until drought cycle ends for several years. It is a high to very high likelihood to impact the County of Placer for a few more years. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas, and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 - 40 dead trees per acre
- Orange depicting 5 -15 dead trees per acre
- Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A number of Placer County areas were designated during this event and the majority of Placer County watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality, along with numerous Tier 1 High hazard “hot spots”. A map of these areas was shown in in Section 4.3.18 of the Base Plan.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015.

No events of past tree mortality have affected the District.

Vulnerability to and Impacts from Tree Mortality

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead trees within the wildland urban intermix or wildland urban interface or urban areas therefore pose a greater risk to due to their proximity to residents, businesses, and road, power, and communication infrastructure.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure.

Assets at Risk

The District noted that none of its facilities from Table G-4 are at risk from this hazard.

Wildfire

Likelihood of Future Occurrence–Occasional

Vulnerability–High

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the Alpine Springs County Water District. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

According to the Community Wildfire Protection Plan (CWPP) for the Alpine Meadows area, lightning is the most common ignition source. Many lightning strikes are accompanied by rain so ignitions do not always expand to wildfires. Dry lightning occurs annually in the District and is a significant concern for ignition. Human ignitions are also a significant a concern. They often occur during the worst fire weather conditions and near populated areas creating the potential for damaging fires. Vehicle and home fires that spread to the wildland pose the greatest ignition risk in Alpine Meadows.

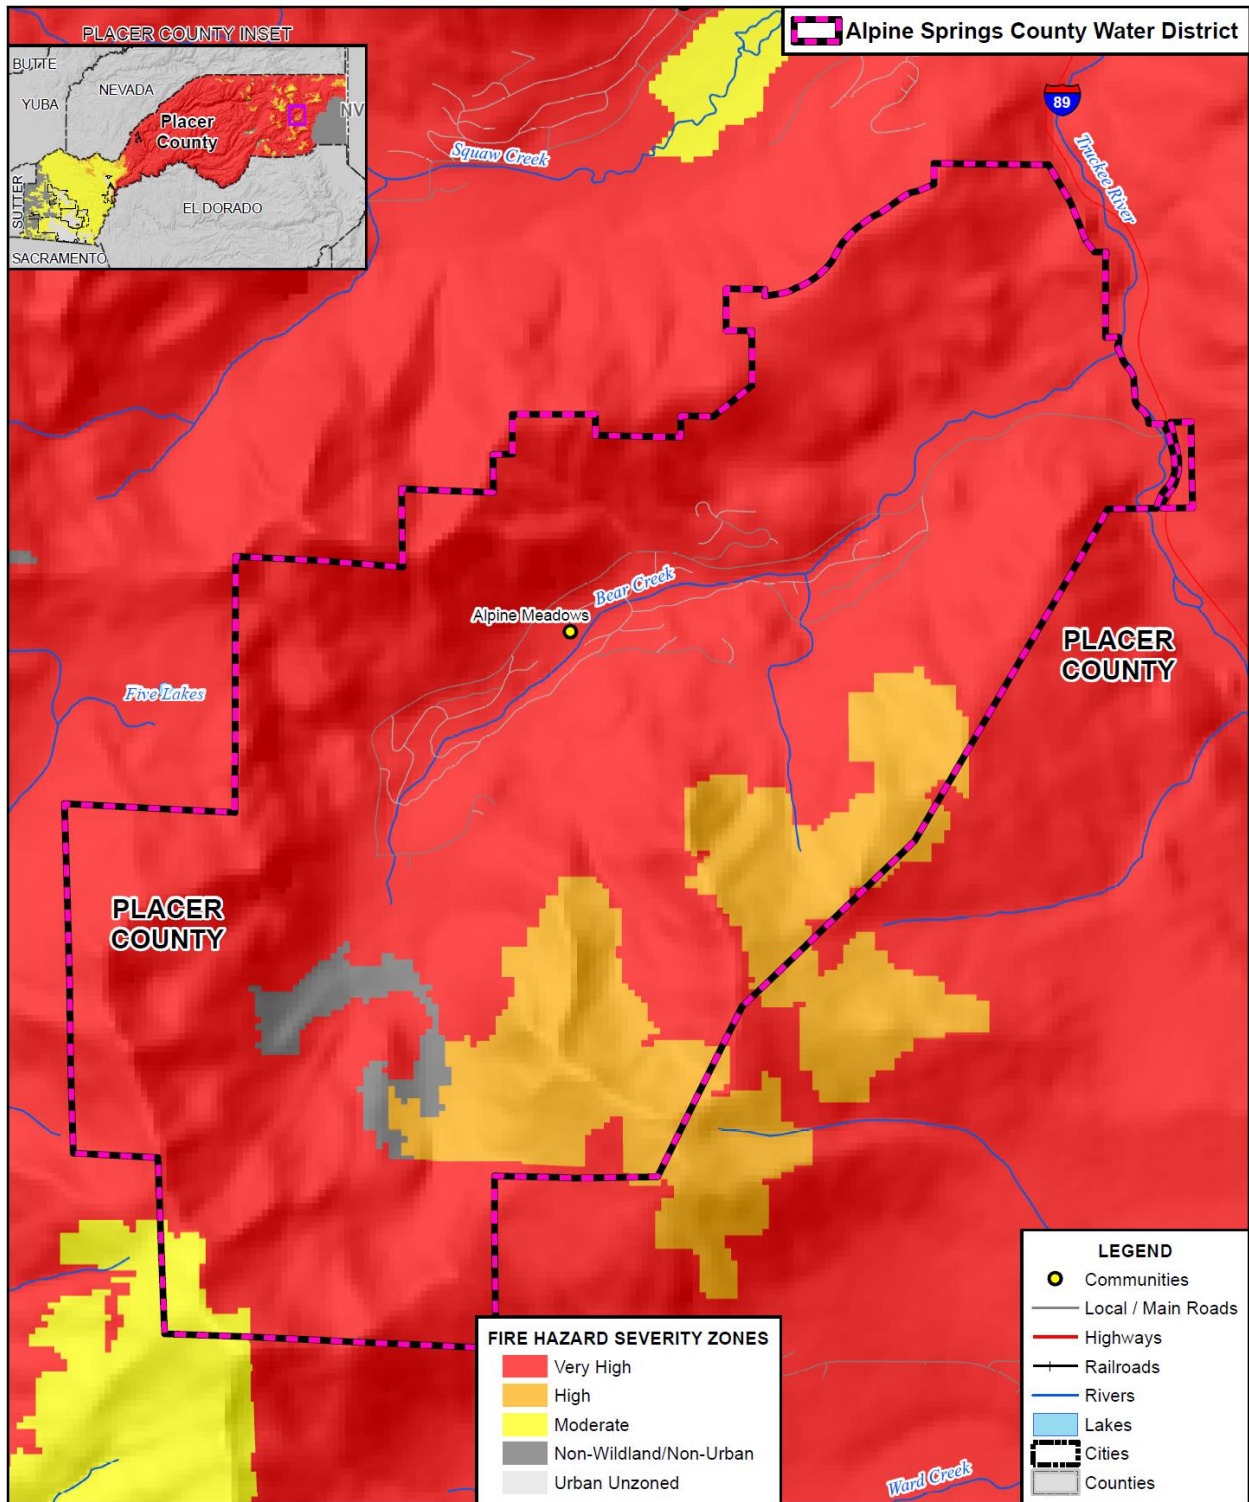

Once an ignition expands into a wildfire, weather and topography usually dictate how devastating the fire will be. According to the CWPP, the high elevation of Alpine Meadows allows for lower temperatures and better moisture recovery during the night. Southwest winds do blow down the canyon but are not very dry. Further, the topography of the canyon is open enough that there would not be a significant chimney effect during a fire. Therefore, the CWPP concludes that the fire weather and topography risk in Alpine Meadows is low relative to other areas in the Tahoe Basin as evidenced by the fire history data for this area. While

there have been a number of ignitions, none of the ignitions have resulted in large, destructive fires in recorded time.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the Alpine Springs County Water District were created. Figure G-3 shows the CAL FIRE FHSZ in the District. As shown on the maps, fire hazard severity zones within the District range from Moderate to Very High.

Figure G-3 Alpine Springs County Water District – Fire Hazard Severity Zones

FOSTER MORRISON
CONSULTING

COUNTY OF
Placer

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table G-10.

Table G-10 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

None of the fire’s listed above created a major impact nor damages to the District and neighboring communities.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat

of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

The Alpine Meadows CWPP concludes that the overall fire threat around the Alpine Meadow neighborhoods is low to moderate. The areas of highest threat are on the south facing slopes above the Juniper Mountain neighborhood. The overall risk of a catastrophic fire moving through the community is considered low, with the greatest risk to homes in the area from a structural fire spreading to one or more neighboring homes.

Assets at Risk

The District noted that all of its facilities from Table G-4 are at risk from this hazard.

G.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

G.6.1. Regulatory Mitigation Capabilities

Table G-11 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the Alpine Springs County Water District.

Table G-11 Alpine Springs County Water District Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	No	Placer County
Capital Improvements Plan	Yes	Update each budget cycle.
Economic Development Plan	No	Placer County
Local Emergency Operations Plan	Yes	
Continuity of Operations Plan	Yes	
Transportation Plan	No	Placer County
Stormwater Management Plan/Program	No	Placer County
Engineering Studies for Streams	No	Placer County
Community Wildfire Protection Plan	Yes 2015	

Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	No	
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	No	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	No	Score:
Fire department ISO rating:	Yes	Rating: 4
Site plan review requirements	Yes	
		Is the ordinance an effective measure for reducing hazard impacts?
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	No	Placer County
Subdivision ordinance	No	Placer County
Floodplain ordinance	No	Placer County
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	No	Placer County
Flood insurance rate maps	No	Placer County
Elevation Certificates	No	Placer County
Acquisition of land for open space and public recreation uses	No	Placer County
Erosion or sediment control program		
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District is seeking to add additional communication resources to agencies that relay on outside resources.		

Source: Alpine Springs County Water District

As indicated above, the District in conjunction with Placer County has several programs, plans, policies, and codes and ordinances that guide hazard mitigation. Some of these are described in more detail below.

Voluntary Water Conservation Program

The objectives of the voluntary water conservation program are to:

1. increase the awareness of valley residents as to the need to conserve water;
2. educate valley residents as to how they can conserve water; and
3. decrease household and commercial use of water, including water used for irrigation, during the months of June through October.

Other Programs

Other programs within the District include the following:

- Wildfire Prevention Program

- ✓ Community Chipper program
- ✓ Defensible space reviews for homeowners
- ✓ Building material reviews for homeowners

Water Conservation Plan

The District has a limited supply of water, and sometimes the demand for water exceeds the supply. To maintain reserve water supply capacity for the health and safety responsibilities of the District, the District has implemented a Water Conservation Plan.

Emergency Response Plan

The District has developed a policy to establish parameters by which the District shall plan for and respond to District-related emergency situations that include:

- Acts of God
 - ✓ Earthquake
 - ✓ Flood
 - ✓ Earth Slide
 - ✓ Avalanche
- Extended power outage
- Computer system failure, including SCADA
- Communication system failure
- Catastrophic infrastructure failure
- Loss of vehicle access to the valley
- Fire
- Pervasive water supply contamination

Community Wildfire Protection Plan, 2015

The CWPP was updated in 2015 as part of the Lake Tahoe Basin Community Wildfire Protection Plan. The Alpine Meadows area is included under the North Tahoe Fire Protection District (NTFPD). Alpine Springs County Water District is responsible for fire protection and Emergency Medical Transport (EMT) services. The District contracts with NTFPD for these services. The CWPP summarizes wildfire dangers and issues within the community, catalogs community wildfire protection needs, and identifies corrective action and community projects that will mitigate some of the problems.

Water Resource Policy

The District has developed a water resource policy to establish parameters by which the District will manage its water resources. This policy includes parameters for the protection of water sources, water quality, water quantity, and environmental considerations.

Watershed Management Policy

Water in the Bear Creek Valley is a precious and limited resource. It is therefore necessary for the protection of all life in the Valley – human and native flora and fauna – to establish parameters under which the District will protect and preserve the natural resources of the Bear Creek watershed.

Codes and Ordinances

Avalanche

Placer County’s avalanche management program defines Potential Avalanche Hazard Areas (PAHAs) where the minimum probability of avalanche occurrence is 1 in 100 per year or where avalanche damage has already occurred. According to the Placer County Avalanche Ordinance the following information must be disclosed in PAHAs:

- Identification that a structure is within a PAHA;
- A warning that avalanche control work is conducted in the area and avalanche warnings will be provided as feasible; and
- Identification of sources that provide weather information and general information on avalanches.

In addition, the County limits construction as necessary in PAHAs and will not issue a building permit for construction in a PAHA without certifying that the structure will be safe under the anticipated snow loads and conditions of an avalanche.

Wildfire

The District and Placer County have a number of standards and ordinances, based on California Public Resources Code 4290, in place to address community design issues regarding wildfire hazard preparedness. Ordinances specify details such as:

- Road, driveway and turnaround dimensions to provide safe ingress and egress for the public and fire suppression resources during a fire event;
- Emergency water supply for sustained firefighting operations; and
- Use of flame-resistant building materials in home construction, specifically in roofing and siding materials.
- The banning of open burning, including campfires during high fire hazard periods.

In addition to the codes and ordinances for community design, the District has adopted Planned Community Development Guidelines and Conditions for subdivisions based on the codes and ordinances. The document provides developers guidelines on mitigation measures and community design guidelines for subdivision construction in the District, streamlining the approval process by illustrating approved community design elements in the District.

G.6.2. Administrative/Technical Mitigation Capabilities

Table G-12 identifies the District department(s) responsible for activities related to mitigation and loss prevention in the District.

Table G-12 Alpine Springs County Water District’s Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	No	Placer County
Mitigation Planning Committee	No	Placer County
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Yes	Tree removal as part of annual budget
Mutual aid agreements	Yes	
Other		
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	No	
Floodplain Administrator	No	
Emergency Manager	No	
Community Planner	No	
Civil Engineer	No	
GIS Coordinator	No	
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	No	
Hazard data and information	No	
Grant writing	No	
Hazus analysis	No	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Programs set up specifically for small low staff districts will be sought to increase District capabilities.		

Source: Alpine Springs County Water District

G.6.3. Fiscal Mitigation Capabilities

Table G-13 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table G-13 Alpine Springs County Water District’s Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Yes	Capital improvement projects are typically projects that replace existing assets. Funding for mitigation projects is at the discretion of the Board of Directors.
Authority to levy taxes for specific purposes	No	
Fees for water, sewer, gas, or electric services	Yes	District enterprise funds include water, sewer, and solid waste. The District is currently researching the potential to allocate a portion of these funds to fuels reduction.
Impact fees for new development	Yes	The fire department assesses mitigation fees for new development.
Storm water utility fee	No	
Incur debt through general obligation bonds and/or special tax bonds	No	
Incur debt through private activities	No	
Community Development Block Grant	No	
Other federal funding programs	No	
State funding programs	No	
Other	Yes	Sierra Nevada Conservation District
How can these capabilities be expanded and improved to reduce risk?		
Improvements to streamline the application process to receive funding from additional sources for mitigation will be sought.		

Source: Alpine Springs County Water District

G.6.4. Mitigation Education, Outreach, and Partnerships

Table G-14 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table G-14 Alpine Springs County Water District’s Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	No	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Yes	District Newsletter - articles highlight fire safety, water conservation, and information important to the community

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Natural disaster or safety related school programs	No	
StormReady certification	No	
Firewise Communities certification	Yes	Holds an annual clean-up day.
Public-private partnership initiatives addressing disaster-related issues	No	
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District will seek to engage local community and homeowner groups to assist with education and outreach.		

Source: Alpine Springs County Water District

The District has contracted with the North Tahoe Fire Protection District (NTFPD) to provide fire suppression and emergency medical services within the Alpine Meadows community. The Squaw Valley Fire Department (part of the Squaw Valley Public Service District) also provides automatic aid services to Alpine Meadows through agreement with the NTFPD.

The entire water district is classified by the State of California as State Responsibility Area (SRA). This means the responsibility for prevention and suppression of wildland fires is the responsibility of CAL FIRE. The USFS, Tahoe National Forest, and Truckee Ranger District provide these direct protection responsibilities on behalf of the State of California through an exchange of acres agreement.

Wildfire protection services are provided at the local level by the NTFPD. Through the NTFPD, Alpine Meadows is also covered by the Lake Tahoe Regional Chiefs Association mutual aid agreement, providing simplified access to Lake Tahoe Basin fire departments upon request. The NTFPD is also a signatory to the California Master Mutual Aid System. As a system participant, NTFPD has access to free firefighting resources throughout the State of California.

G.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

Alpine Meadows Consolidated Defensible Space Project

The project being proposed by ASCWD is to reduce dangerous forest fuel loading on 50 acres in the Alpine Meadows area (This project was completed in August 2012). The District has offered free residential chipping services and defensible space inspections to approximately 200 private properties over the last two (2) years. The project consisted of two elements. The first element was the reduction of overgrown forest fuels on common properties owned by three homeowners associations and the water district that intertwine between private homes along the valley. The second element is funding a community chipper program to the residents of the district for many years.

G.7 Mitigation Strategy

G.7.1. Mitigation Goals and Objectives

The Alpine Springs County Water District adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

G.7.2. Mitigation Actions

The planning team for the Alpine Springs County Water District identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Avalanche
- Climate Change
- Drought & Water Shortage
- Earthquake
- Floods: 1% / 0.2% Annual Chance
- Floods: Localized Stormwater
- Landslides, Mudslides, and Debris Flows
- Pandemic
- Severe Weather: Freeze and Snow
- Severe Weather: Heavy Rains and Storms
- Severe Weather: High Winds and Tornadoes
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Fire Fuels Mitigation

Hazards Addressed: Wildfire, Drought and Water Shortage, High Winds and Tornadoes, Climate Change

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: A buildup of forest fuel loads has substantially increased the risk of the spread of wildfire

Project Description: Parcel and forest treatment to reduce the forest loads in and around Alpine Meadows

Other Alternatives: N/A

Existing Planning Mechanism(s) through which Action Will Be Implemented:

- Community cleanup days
- Community Chipping Program
- Outside contracts with Foresters and NTFPD

Responsible Agency/ Department/Partners: ASCWD

Cost Estimate: \$25,000 annually

Benefits (Losses Avoided): Catastrophic fire losses to homes and business

Potential Funding: Additional funding may be available if awarded the State of California Climate Investment Fire Prevention Grant

Timeline: Annually

Project Priority (H, M, L): High

Action 2. Emergency Electrical Generator Replacement Project

Hazards Addressed: Avalanche, Earthquake, Flood, Localized Flood, Landslide, Freeze and Snow, Heavy Rains, Wildfire

Issue/Background: This project would replace the District's single, fifty plus year old emergency diesel electrical generator. The District has a single emergency electrical generator. The generator was placed in service in 1961 and has reached the end of its useful life. The current generator serves only the office building, which is the designated Emergency Operation Center for the Valley. The new generator will be sized to supply emergency power to the office, fire station and vehicle storage building. It will also be equipped with an automatic transfer switch.

Other Alternatives: No other action.

Existing Planning Mechanism(s) through which Action Will Be Implemented: ASCWD Long Range Capital Improvement Program

Responsible Office/Partners: Alpine Springs County Water District

Project Priority: High

Cost Estimate: \$55,000

Benefits (Losses Avoided): Protection of property and life safety.

Potential Funding: ASCWD Long Range Capital Improvement Program

Timeline: Within 5 years

Action 3. Water Storage Tank Replacement Project

Hazards Addressed: Earthquake and Wildfire

Issue/Background: This project would replace the District’s four circular prestressed concrete and one redwood water storage tanks. A recent inspection of the tanks found that “they clearly would not meet current design criteria, especially seismic criteria” and based up the tanks dimensions the tanks are subject to overturning in an earthquake. The District has four (4) 100,000 gallon prestressed concrete tanks and one (1) 500,000 gallon redwood tank. This project would replace one (1) 100,000 gallon concrete tank and the one (1) 500,000 gallon redwood tank with a single 600,000 gallon buried reinforce concrete water storage tank. Each of the three remaining 100,000 gallon tanks would be replaced by buried reinforced concrete water storage tanks. This project would provide the District with water storage facilities protected from earthquake and fire hazards.

Other Alternatives: No other action.

Existing Planning Mechanism(s) through which Action Will Be Implemented: ASCWD Long Range Capital Improvement Program

Responsible Office/Partners: Alpine Springs County Water District

Project Priority: High

Cost Estimate:

- Water Storage Tanks 1, 2, 3, 4, and 5 100,000 gallons each at \$175,000 each.
- Water Storage Tank 4A 500,000 gallons \$1,000,000.

Benefits (Losses Avoided): Protection of property and life safety.

Potential Funding: ASCWD Long Range Capital Improvement Program

Timeline: Within 5 years

Action 4. Mineral Springs Soil Bank Stabilization Project

Hazards Addressed: Flood, Localized Flood, Heavy Rain and Storms, Landslide

Issue/Background: A section of the 10" sewer main that serves the Alpine Meadows community is located adjacent to and between Mineral Springs Trail and Bear Creek. Recent flooding (2006 and 1997) along with annual erosion by Bear Creek have eroded and undercut the 40 to 50 foot high bank approximately 30 feet. Continued erosion and undercutting by Bear Creek will result in the loss of this 10" sewer main. The failure of this 10" sewer main would result in approximately two thirds of the 650 sewer customers' sewage discharging into Bear Creek. Bear Creek discharges into the Truckee River. Discharge of sewage would pose a potential risk to human health and the environment.

This proposed project would complete evaluation of current site conditions, develop recommended slope stabilization (most likely large boulders 2 – 3 tons along with gabions), and install the recommended slope stabilization.

Other Alternatives: Replace approximately 150 feet of 10" sewer main with a pump station and force main. The pump station would require stand-by power because of the inability to provide on-site storage. The site is constrained. A second alternative would be to rent and have available during each major storm or flood event pump around equipment and facilities.

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Office/Partners: Alpine Springs County Water District in conjunction with Placer County Public Works Department.

Project Priority: High

Cost Estimate: \$550,000

Benefits (Losses Avoided): Potential fines for sewage overflows are estimated at \$10 per gallon. Depending on the time it would take to get pumping equipment into place, the fines range from a low of \$576,000 to \$1,483,200 (412 customers with average daily flow of between 140 gallons per day to 360 gallons per day). In addition to the fines, additional resources would be needed for spill response and clean up, pump around equipment rental and set up, and the construction of replacement facilities. Project would protect natural resources by reducing the potential for spills of untreated wastewater into waterways.

Potential Funding: Grant funding, budget funding, Placer County, ASCWD

Timeline: Within 5 years

Action 5. *Alpine Meadows Consolidated Defensible Space Continuation Project*

Hazards Addressed: Wildfire, Drought and Water Shortage, High Winds and Tornadoes, Climate Change

Issue/Background: This project would continue fuels reduction on an additional 50 acres of commonly held properties within the Bear Creek watershed, or the Alpine Meadows community. This project will also provide curbside chipping services and defensible space inspections for 200 homes. This project aims to build on the community awareness and educational efforts underway in the area in order to reduce fuel loadings on common properties and to inspire and educate private property owners to complete defensible

space treatments on their property. Finally, this project will serve as a model project by applying mitigation and monitoring techniques for prescribed burning of piles in a riparian area where no other means of slash disposal exists.

Other Alternatives: No other action.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Lake Tahoe Basin community Wildfire Protection Plan – August 2015

Responsible Office/Partners: Alpine Springs County Water District in conjunction with the North Tahoe Fire Protection District

Project Priority: High

Cost Estimate: \$ 200,000

Benefits (Losses Avoided): Protection of property and life safety

Potential Funding: Grant funding, Budget funding, North Tahoe Fire Protection District, ASCWD

Timeline: Within 5 years

Annex H Foresthill Fire Protection District

H.1 Introduction

This Annex details the hazard mitigation planning elements specific to Foresthill Fire Protection District (FFPD), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to FFPD, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

H.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table H-1. Additional details on plan participation and District representatives are included in Appendix A.

Table H-1 FFPD – Planning Team

Name	Position/Title	How Participated
Michael Ridley	Fire Chief	Provided data
Jed Matcham	Assistant Fire Chief	Reviewed data

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the District integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the District incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table H-2.

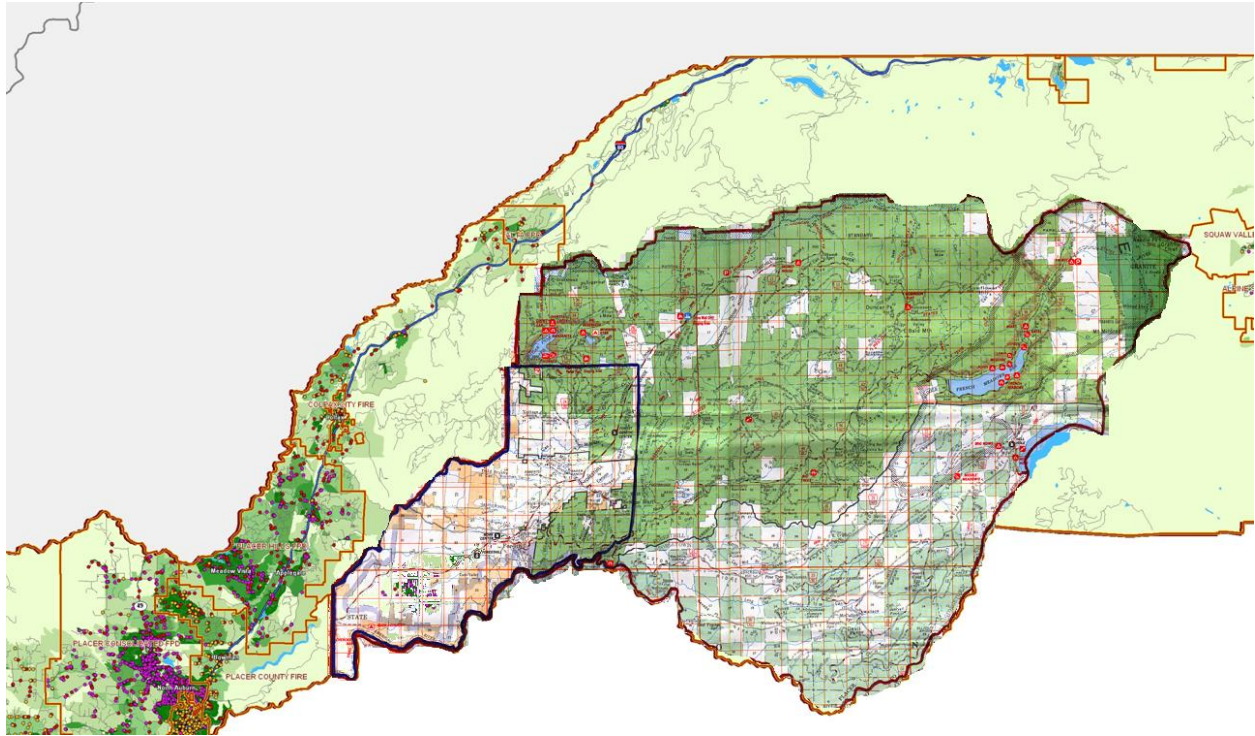

Table H-2 2016 LHMP Incorporation

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
N/A	No planning related to the LHMP was performed since 2016.

H.3 District Profile

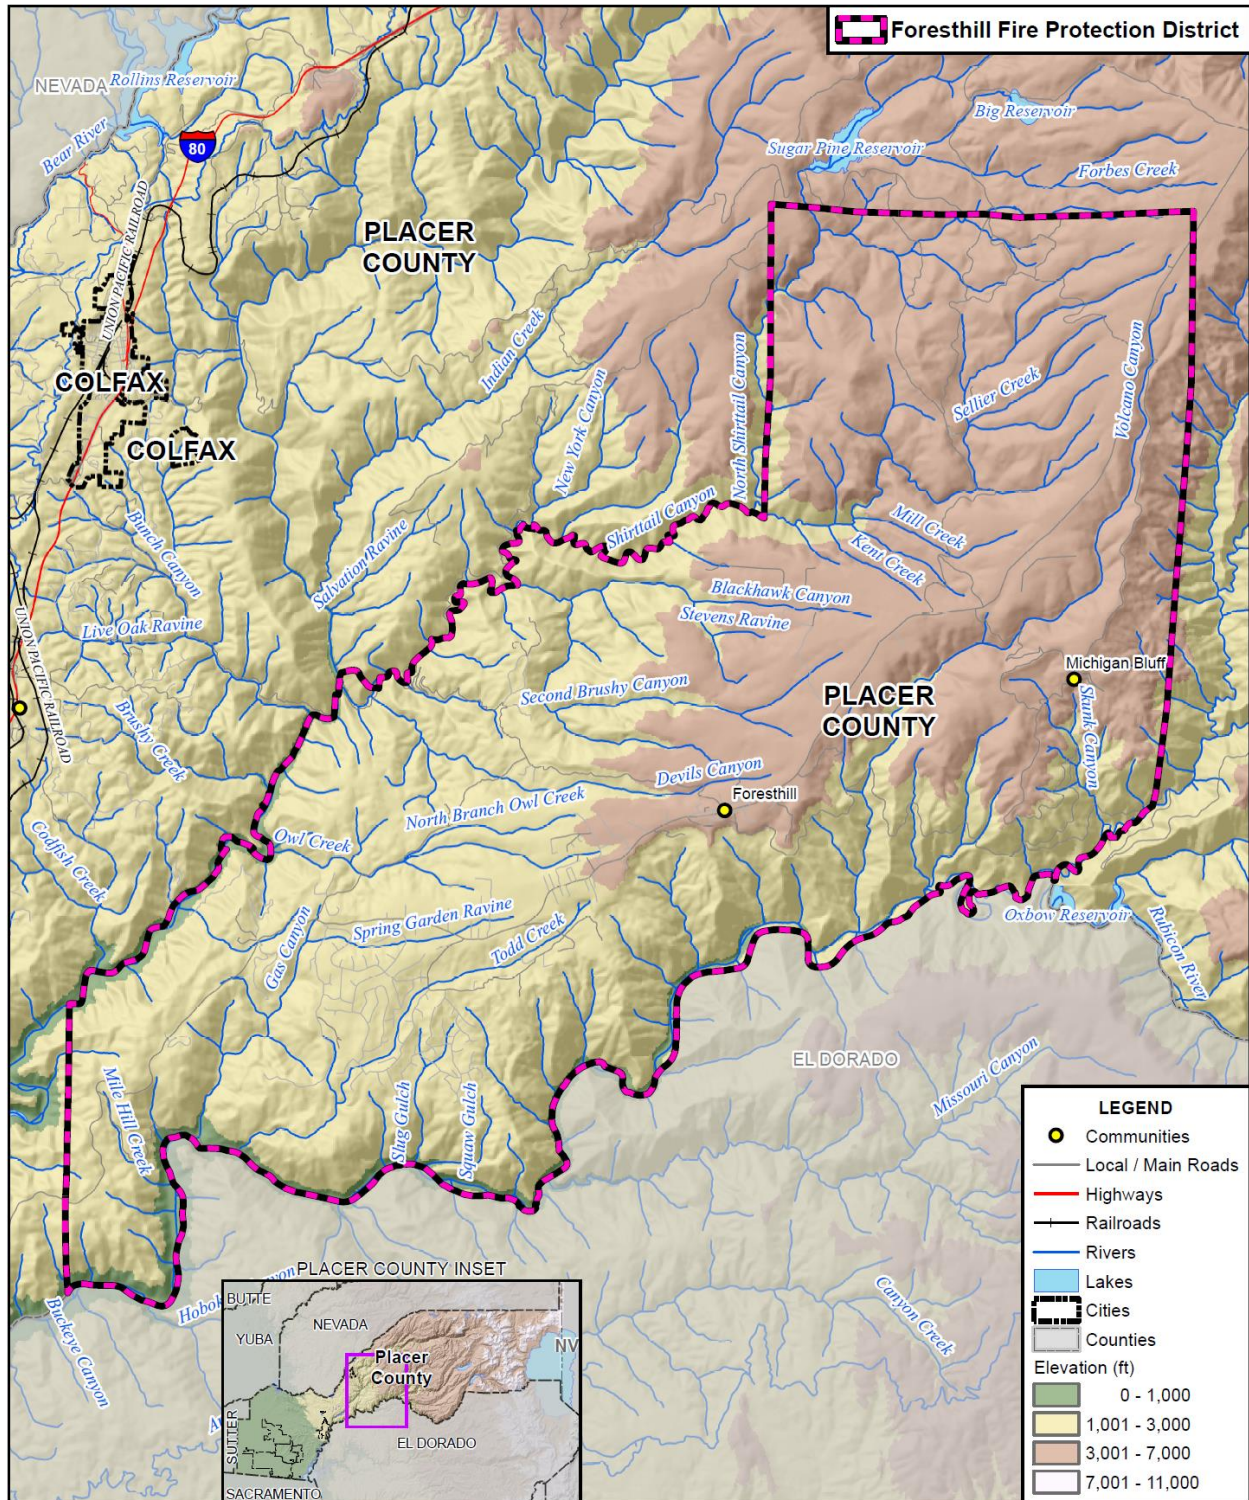

The District profile for the FFPD is detailed in the following sections. Figure H-1 and Figure H-2 display maps and the location of the District within Placer County.

Figure H-1 FFPD

Source: FFPD

Figure H-2 FFPD

FOSTER MORRISON
CONSULTING

0 2.5 5 Miles

COUNTY OF
Placer

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

H.3.1. Overview and Background

The FFPD serves the greater Foresthill area including Todd Valley, Baker Ranch, Michigan Bluff, and Sugar Pine. The District provides local advanced life support to the community following the merge with Foresthill Ambulance Service. Fire stations located in Foresthill and Todd Valley respond to structure and wildland fires, vehicle accidents, and medical emergencies. The District is staffed by a combination of paid and volunteer firefighters, EMTs, and paramedics. The District was created in April of 1946, after over 15 years of service by the Foresthill Volunteer Fire Department.

Foresthill is located on a broad ridge between the North and Middle Forks of the American River. The Foresthill community covers approximately 11.2 square miles and is located at an elevation of 3,228 feet.

The community of Foresthill, California was founded in 1850 during the California Gold Rush when prospectors swarmed over the Sierra Nevada Mountain divide between the North and Middle Forks of the American River. After the gold played out, many Foresthill settlers turned to logging the tall trees that cover the divide and a dozen lumber mills were established in and around Foresthill. The harvesting of timber, just like gold, eventually became too costly to pursue and the mills were closed, causing many of the residents to seek employment “off the hill” in nearby Auburn and even Sacramento.

Foresthill, however, was not “down-and-out.” With the wonderful outdoor recreational opportunities of the Tahoe National Forest, beautiful lakes and snow covered mountains, and the improvement of Foresthill Road during the 1990s by the federal government, people seem to have rediscovered the Foresthill Divide. Land values are on the rise, beautiful new homes are springing up throughout the woods, and the new Foresthill High School makes K-12 education a unique mountain-top experience.

In the Foresthill area, wildland fire suppression is the primary responsibility of CDF and the USFS, with additional support provided through mutual aid. The District has primary responsibility for non-wildland fire incidents that include structure fires, vehicular fires, extreme weather events, mass casualty incidents, etc.

H.4 Hazard Identification

FFPD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table H-3).

Table H-3 FFPD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Limited	Unlikely	Negligible	Low	Medium
Avalanche	Limited	Unlikely	Limited	Low	Medium
Climate Change	Extensive	Likely	Catastrophic	High	–
Dam Failure	Limited	Unlikely	Negligible	Low	Medium
Drought & Water Shortage	Extensive	Likely	Critical	High	High
Earthquake	Limited	Unlikely	Negligible	Low	Low
Floods: 1%/0.2% annual chance	Limited	Occasional	Negligible	Low	Medium
Floods: Localized Stormwater	Extensive	Highly Likely	Low	Low	Medium
Landslides, Mudslides, and Debris Flows	Limited	Unlikely	Negligible	Low	Medium
Levee Failure	Limited	Unlikely	Negligible	Low	Medium
Pandemic	Extensive	Likely	Limited	Low	Medium
Seiche	Limited	Unlikely	Negligible	Low	Medium
Severe Weather: Extreme Heat	Extensive	Highly Likely	Limited	Medium	High
Severe Weather: Freeze and Snow	Extensive	Highly Likely	Limited	Low	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Highly Likely	Negligible	Low	Medium
Severe Weather: High Winds and Tornadoes	Extensive	Highly Likely	Limited	High	Low
Tree Mortality	Extensive	Highly Likely	Catastrophic	High	High
Wildfire	Extensive	Highly Likely	Catastrophic	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

H.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District’s hazards and assess the District’s vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

H.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section H.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table H-3) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

H.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District’s total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the FFPD’s assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table H-4 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. FFPD’s physical assets, valued at over \$14 million, consist of the buildings and infrastructure to support the District’s operations.

Table H-4 FFPD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
Station 88	Essential	\$5,500,000	Wildfire, earthquake
District Administration Building	Essential	\$2,500,000	Wildfire
Station 90	Essential	\$4,500,000	Wildfire
Station 89	Essential	\$1,000,000	Wildfire
Porter Garage	Essential	\$500,000	Wildfire, earthquake
Total		\$14,000,000	

Source: FFPD

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. FFPD provides services to a population of over 7,000 people in an 89 square mile area. The median age of residents is 51.5 years old. 59% of the population is between the ages of 18 and 64 years old. The District has approximately 2,900 housing units. 99.3% of our population live and work in a Tier 3 Fire Hazard Severity Zone.

Natural Resources

FFPD has a variety of natural resources of value to the District. These natural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Historic and Cultural Resources

FFPD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

Foresthill Divide is located between the Middle Fork and North Fork of the American River. With the views in the area, developers are planning subdivisions on the canyon rims directly adjacent to unmaintained Bureau of Reclamation lands.

According to the 2007 Capital Improvement Plan for the District, the 2007 service population was estimated at 7,300. Using the plan's 3 percent assumed growth rate, new development is anticipated to increase the service population between 2007 and 2030 by 7,100 for a total service population of 14,300 by year 2030. The plan indicates that an estimated \$12.6 million in capital improvements will be necessary by 2030 to meet the growing demands of the District's service area. This is beyond the capabilities of the Fire District to complete. This should be a Placer County issue to address.

As Foresthill area grows there will be further demand for emergency services, more vehicle accidents, and more fires. The development of the commercial property will also bring with it, an increase in use and storage of hazardous chemicals and associated environmental concerns.

It is important to note that there are several elderly, disabled, and low income people in the Foresthill area. In the case of a wildfire evacuation, these people may not have transportation. Likewise, in the event of a power outage during the winter months, these special populations may not be able to get to a shelter for warmth.

Development since 2016

There has been minor development since 2016, but the development has had little impact on the vulnerability of the District. No District facilities have been constructed since 2016. District Administration building has been upgraded and a Department Operation Center (DOC) has been developed. The District noted that its stations are too small to provide proper apparatus and equipment storage.

Future Development

The District has no direct control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. District facilities need to be expanded and the stations need to be rebuilt to fit the expanding role of the Fire District. However, there are no funds available for these critical needs. More general information on growth and development in Placer County as a whole can be found in "Growth and Development Trends" in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

H.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table H-3 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Climate Change

Likelihood of Future Occurrence—Likely

Vulnerability—High

Hazard Profile and Problem Description

Climate change adaptation is a key priority of the State of California. The 2018 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state’s infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing. The Fire District has seen an increase in the number of responses related to medical and fire emergencies due to the higher temperatures, low moisture levels and tree mortality and related to the lesser amounts of precipitation.

Location and Extent

Climate change is a global phenomenon. It is expected to affect the whole of the District, Placer County, and State of California. There is no scale to measure the extent of climate change. Climate change exacerbates other hazards, such as drought, extreme heat, flooding, wildfire, and others. The speed of onset of climate change is very slow. The duration of climate change is not yet known, but is feared to be tens to hundreds of years.

Past Occurrences

Climate change has never been directly linked to any declared disasters. While the District noted that climate change is of concern, no specific impacts of climate change could be recalled. The District and HMPC members did, however, note that in Placer County, the strength of storms does seem to be increasing and the temperatures seem to be getting hotter. Hotter temperatures, combined with recent drought conditions, exacerbates the potential for damaging wildfires. One significant snow event in the past year that resulted in The District responding to more than 28 calls in a 24-hour period. Normally, we average about 2 calls per day.

Vulnerability to and Impacts from Climate Change

The California Adaptation Planning Guide (APG) prepared by California OES and CNRA was developed to provide guidance and support for local governments and regional collaboratives to address the unavoidable consequences of climate change. California's APG: Understanding Regional Characteristics has divided California into 11 different regions based on political boundaries, projected climate impacts, existing environmental setting, socioeconomic factors and regional designations. Placer County falls within the North Sierra Region characterized as a sparsely settled mountainous region where the region's economy is primarily tourism-based. The region is rich in natural resources, biodiversity, and is the source for the majority of water used by the state. This information can be used to guide climate adaptation planning in the District and Placer County Planning Area.

The California APG: Understanding Regional Characteristics identified the following impacts specific to the North Sierra region in which the Placer County Planning Area is part of:

- Temperature increases
- Decreased precipitation
- Reduced snowpack
- Reduced tourism
- Ecosystem change
- Sensitive species stress
- Increased wildfire

The District noted that higher temperatures in the summer and the severe snowstorms in the winter attract more people to the Tahoe National Forest. The District provides Advanced Life Support response and transport services to the area. These services provided are not fully funded and have a significant impact on the District's budget.

Assets at Risk

The District noted that its facilities will most likely not be at risk from climate change.

Drought & Water Shortage

Likelihood of Future Occurrence—Likely

Vulnerability—High

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area’s usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table H-5.

Table H-5 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

Assets at Risk

All of the District's critical infrastructure from Table H-4 is within a Tier 3 Fire Hazard Severity Zone. This results in the threat of wildfire destroying some or all of the infrastructure.

Severe Weather: Extreme Heat

Likelihood of Future Occurrence—Highly Likely

Vulnerability—Medium

Hazard Profile and Problem Description

According to FEMA, extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. Heat kills by taxing the human body beyond its abilities. In extreme heat and high humidity, evaporation is slowed, and the body must work extra hard to maintain a normal temperature.” Most heat disorders occur because the victim has been overexposed to heat or has over-exercised for his or her age and physical condition. Older adults, young children, and those who are sick or overweight are more likely to succumb to extreme heat.

In addition to the risks faced by citizens of the District, there are risks to the built environment from extreme heat. While extreme heat on its own does not usually affect structure, extreme heat during times of drought can cause wildfire risk to heighten. Extreme heat and high winds can cause power outages and PSPS events, causing issues to buildings in the District.

Extreme Heat and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, including periods of high winds, high temperatures, and low humidity, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Location and Extent

Heat is a regional phenomenon and affects the whole of the District. Heat emergencies are often slower to develop, taking several days of continuous, oppressive heat before a significant or quantifiable impact is seen. Heat waves do not strike victims immediately, but rather their cumulative effects slowly affect vulnerable populations and communities. Heat waves do not generally cause damage or elicit the immediate response of floods, fires, earthquakes, or other more "typical" disaster scenarios.

The NWS has in place a system to initiate alert procedures (advisories or warnings) when extreme heat is expected to have a significant impact on public safety. The expected severity of the heat determines whether advisories or warnings are issued. The NWS HeatRisk forecast provides a quick view of heat risk potential over the upcoming seven days. The heat risk is portrayed in a numeric (0-4) and color (green/yellow/orange/red/magenta) scale which is similar in approach to the Air Quality Index (AQI) or the UV Index. This can be seen in Section 4.3.2 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for heat. The District Planning Team noted that since extreme heat is a regional phenomenon, events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.2.

The District noted that there have been numerous Power Safety Power Shutoffs (PSPS) in Foresthill. 8 times in the past year out of 9 events that occurred in the County. The District noted that future events are likely as high winds affect the power grid and the District is in a Tier 3 Fire Hazard Zone.

Vulnerability to and Impacts from Extreme Heat

The District experiences temperatures in excess of 100°F during the summer and fall months. The temperature moves to 105-110°F in rather extreme situations. During these times, drought conditions may worsen. Also, power outages and PSPS events may occur during these times as well, especially when combined with the potential for severe wind events. Health impacts, including loss of life, are often the primary concern with this hazard, though economic impacts can also be an issue.

Days of extreme heat have been known to result in medical emergencies, and unpredictable human behavior. Periods of extended heat and dryness (droughts) can have major economic, agricultural, and water resources impacts. Extreme heat can also dry out vegetations, making it more vulnerable to wildfire ignitions and spread.

The District does not have the ability to provide cooling centers to our populace. If the power is out our local schools, churches, etc. will not be able to provide shelter either. The extreme heat also results in medical responses that can require extended commitments of resources due to many incidents being remotely located out in the wilderness area. Extreme heat also plays a major factor in the ignitability of fuels, rapid spread of fire, and extent of fire damage when a fire occurs. This obviously requires the District to commit resources for longer periods of time, resulting in the inability to provide other emergency services to our jurisdiction.

Assets at Risk

No District assets (from Table H-4) are at risk from this hazard.

Severe Weather: High Winds and Tornadoes

Likelihood of Future Occurrence—Highly Likely

Vulnerability—High

Hazard Profile and Problem Description

High winds, as defined by the NWS glossary, are sustained wind speeds of 40 mph or greater lasting for 1 hour or longer, or winds of 58 mph or greater for any duration. High winds can cause significant property and crop damage, threaten public safety, and have adverse economic impacts from business closures and power loss. High winds are a primary factor in PSPS events.

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes form when cool, dry air sits on top of warm, moist air. Tornadoes are the most powerful storms that exist. Tornadoes, though rare, are another severe weather hazard that can affect areas of the Placer County Planning Area, primarily during the rainy season in the late fall, winter, and early spring.

Location and Extent

The entire District is subject to significant, non-tornadic (straight-line), winds. Each area of the County is at risk to high winds. Magnitude of winds is measured often in speed and damages. These events are often part of a heavy rain and storm event, but can occur outside of storms. The speed of onset of winds can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of winds in California is often short, ranging from minutes to hours. The Beaufort scale is an empirical 12 category scale that relates wind speed to observed conditions at sea or on land. Its full name is the Beaufort Wind Force Scale. The Beaufort Scale was shown in Section 4.3.5 of the Base Plan.

Portions of the County are also located in a special wind hazard region, which is a result of foehn winds. A foehn wind is a type of dry down-slope wind that occurs in the lee (downwind side) of a mountain range. Winds of this type are called "snow-eaters" for their ability to make snow melt or sublimate rapidly. This snow-removing ability is caused not only by warmer temperatures, but also the low relative humidity of the air mass coming over the mountain(s). They are also associated with the rapid spread of wildfires, making some regions which experience these winds particularly fire prone.

Tornadoes, while rare, can occur at any location in the County and District. Prior to February 1, 2007, tornado intensity was measured by the Fujita (F) scale. This scale was revised and is now the Enhanced Fujita scale. Both scales are sets of wind estimates (not measurements) based on damage. The new scale (EF) provides more damage indicators (28) and associated degrees of damage, allowing for more detailed analysis and better correlation between damage and wind speed. It is also more precise because it considers the materials affected and the construction of structures damaged by a tornado. The F Scale and EF Scale are shown in Section 4.3.5 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for winds and tornadoes. The District noted that since high winds is a regional phenomenon, events that affected the lower to middle elevations of the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.5. All PSPS events have caused damage to the power grid at different levels. Downed trees provide the biggest threat to the District.

Vulnerability to and Impacts from Severe Weather: Wind and Tornado

High winds are common occurrences in the District throughout the entire year. Straight line winds are primarily a public safety and economic concern. Windstorm can cause damage to structures and power lines which in turn can create hazardous conditions for people. Debris flying from high wind events can shatter windows in structures and vehicles and can harm people that are not adequately sheltered. High winds can impact critical facilities and infrastructure and can lead to power outages. Wind can also drive wildfire flames, spreading wildfires quickly. During periods of high winds and dry vegetation, wildfire risk increases. High winds that occur during periods of extreme heat can cause PSPS events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Impacts from high winds in the District will vary. Future losses from straight line winds include:

- Downed trees
- Power line impacts and economic losses from power outages
- Increased PSPS events
- Occasional building damage, primarily to roofs

Impacts specific to the District include blocked roadways causing an inability to access incidents or those that need assistance, as well as blocking the only way to get into or out of Foresthill. Downed trees cause significant damage to structures.

Assets at Risk

Stations 89, 90 and the Administration office are at risk from this hazard.

Tree Mortality

Likelihood of Future Occurrence–Highly Likely

Vulnerability–High

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, and contribute to future fuel loads in forests surrounding communities. During extended drought, tree mortality is driven by a build-up in endemic bark beetle populations and exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events. Several areas within the District forests show signs of Pine Beetle and thus will become more vulnerable to wildfire.

Location and Extent

Onset of tree mortality events can be relatively fast; however conditions – such as high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas, and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 - 40 dead trees per acre
- Orange depicting 5 -15 dead trees per acre
- Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A number of Placer County areas were designated during this event and the majority of Placer County watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality,

along with numerous Tier 1 High hazard “hot spots”. A map of these areas is shown in in Section 4.3.18 of the Base Plan.

The District has had a severe issue with tree mortality due to drought, infestation, and human caused issues.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015.

Vulnerability to and Impacts from Tree Mortality

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead trees within the wildland urban intermix or wildland urban interface or urban areas therefore pose a greater risk to due to their proximity to residents, businesses, and road, power, and communication infrastructure.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure.

Assets at Risk

All District assets (from Table H-4) are at risk from this hazard.

Wildfire

Likelihood of Future Occurrence–Highly Likely

Vulnerability– Extremely High

Hazard Profile and Problem Description

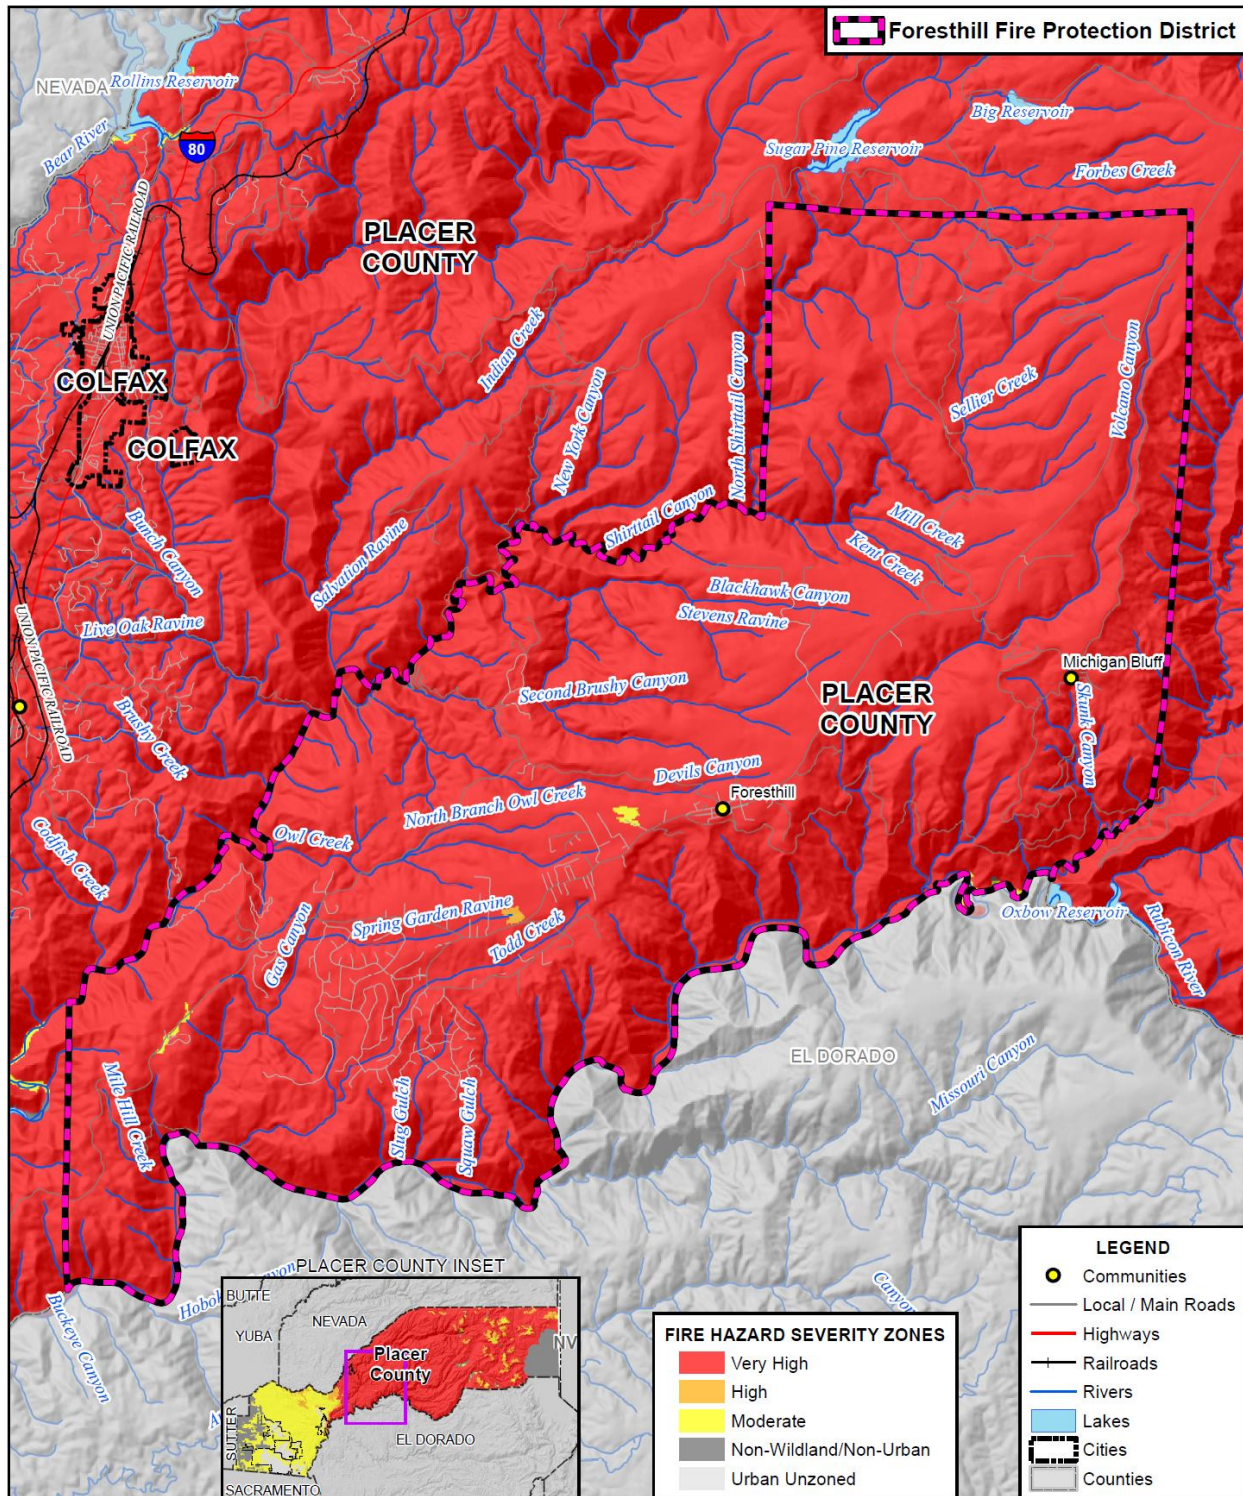

Wildland fire and the risk of a conflagration is an ongoing concern for the FFPD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where

there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the FFPD were created. Figure H-3 shows the CAL FIRE FHSZ in the District. As shown on the maps, fire hazard severity zones within the District fall within the Very High zone.

Figure H-3 FFPD – Fire Hazard Severity Zones

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table H-6.

Table H-6 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

September 2006 – A wildland fire, started by a campfire on Ralston Ridge outside of Foresthill, grew to over 4,000 acres in size. The towns of Michigan Bluff, Foresthill, and Volcano were threatened. Infrastructure damage primarily involved damage to power lines

June 29 to July 18, 2016 – The Trailhead Fire was a wildfire burning in the Middle Fork American River canyon in both Placer County & El Dorado County. 5,646 acres were burned in and near Foresthill. Todd Valley and areas of Foresthill placed on evacuation orders. 2,600 + structures were threatened.

September 4 to 6, 2018 – The Sliger Fire was a wildfire burning in the Middle Fork American River canyon in both Placer County & El Dorado County. 104 acres were burned in and near Foresthill. Todd Valley placed on evacuation orders. 2,000 + structures were threatened.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff

patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

The rural nature within the District boundaries makes the area particularly susceptible to fire due to the heavily forested, cross-compartmented nature of the terrain. The abundance of natural fuels, coupled with extreme low humidity common in the area during fires season, creates potentially volatile situations for both residents and responders.

Assets at Risk

All of the District’s structures from Table H-4 are at risk. One study shows us losing all of our assets from fire under the right conditions.

H.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

H.6.1. Regulatory Mitigation Capabilities

Table H-7 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the FFPD.

Table H-7 FFPD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
-------	-------------	---

Comprehensive/Master Plan/General Plan	N	
Capital Improvements Plan	Y	
Economic Development Plan	N	
Local Emergency Operations Plan	Y	
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	N	Version/Year: CFC 2019
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	Y	Rating: 3/3Y
Site plan review requirements	N	
		Is the ordinance an effective measure for reducing hazard impacts?
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
Vegetation Mitigation Plan for the District to enhance the Placer County Plan. FFPD needs would include upgrading our Department Operations Center, Continuity of Operations Plan, Disaster Recovery Plan, Improved fixed and mobile communications/data capabilities.		

Source: FFPD

As indicated above, the District, in conjunction with the County, has several programs, plans, policies, and codes and ordinances that guide hazard mitigation. Some of these are described in more detail below.

Codes and Ordinances

FFPD, through Placer County has adopted the 2007 California Fire Code. FFPD also defers to Public Resource Codes 4290 (Fire Safe Access) and 4291 (Defensible Space). The Fire Marshal reviews pre-development plans for ingress and egress, fire flow requirements, fire hydrant placement, and placement of shaded fuel breaks. Plan reviews for single family residence in and out of hydrant areas are done as well to ensure proper access and water supply for fire suppression.

Foresthill/Iowa Hill, Community Wildfire Protection Plan, 2011

The Foresthill/Iowa Hill CWPP summarizes wildfire dangers and issues within the Foresthill/Iowa Hill areas. The CWPP also catalogs community wildfire protection needs and identifies corrective action and community projects that will mitigate some of the problems. Communities served by the CWPP with prioritized projects include Michigan Bluff, Baker Ranch, Foresthill, Todd Valley, Yankee Jims, Shirrtail, Sugar Pin Reservoir, Hidden Treasure, Iowa Hill, Kings Hill, Big Dipper, and Roach Hill.

Foresthill/Iowa Hill Risk Assessment Plan, 2009

The Foresthill/Iowa Hill Risk Assessment and Mitigation Strategies (RAMS) process helps provide consistent out-year planning for fire mitigation activities, prevention education, and fuels treatment/biomass programs. RAMS prioritizes fire management units and communities by risk and hazard and develops a strategic out-year budget and program of work for the Foresthill/Iowa Hill Fire Safe Council. This RAMS Plan is an amendment to the Placer County Fire Plan/Placer County CWPP, and represents information that was developed collaboratively by members of the Foresthill/Iowa Hill Fire Safe Council and cooperating state and federal agencies.

Capital Improvement Plan, 2018

The Capital Improvement Plan for the District identifies and budgets projects for new public facilities that will be needed to serve the FFPD projected development and increase in service population through 2030.

Foresthill Divide, Iowa Hill Divide Emergency Plan, 2009

The Emergency Plan for the area provides specific planning information, direction, and coordination guidance on a functional as well as an organizational basis for first responding and contributing agencies facing emergencies in the Foresthill and Iowa Hill areas.

H.6.2. Administrative/Technical Mitigation Capabilities

The District is staffed by a combination of paid and volunteer firefighters, EMTs, and paramedics. The FFPD was created in April of 1946, after over 15 years of service by the Foresthill Volunteer Fire Department. The FFPD presently employs a staff of 18, including a Fire Chief, 2 Assistant Fire Chiefs, 3 Station Captains, three Engineers, an Office Manager, an administrative assistant, EMTs, firefighters, and paramedics, and is run by a five person Board of Directors.

Three fire stations house the fire engines, brush units, rescue units, a water tender, and three ambulances. Fire Station 88 is located on Gold Street, Station 89 on Foresthill Road near the Placer County corporate yard, and Station 90 is at the intersection of Foresthill Road and Happy Pines Road. The District office is located at 24320 Main Street at the old Safety Club building. Table H-8 identifies the personnel responsible for activities related to mitigation and loss prevention in the District.

Table H-8 FFPD’s Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	Y	In coordination with Placer County
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	N	
Mutual aid agreements	Y	
Other

How can these capabilities be expanded and improved to reduce risk?		
Low power AM (1020 AM) Emergency Alert Radio system. To enhance emergency notification of area residents and visitors of local events and emergency notification of evacuations or shelter in place directions/information. Working with the Placer County Sheriff’s Department. Grant writing assistance, adding/improving public notification systems for the challenging terrain in the area.		

Source: FFPD

H.6.3. Fiscal Mitigation Capabilities

Table H-9 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table H-9 FFPD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	N	
Authority to levy taxes for specific purposes	N	
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	Y	Used for capital expenses
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	N	
State funding programs	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
Impact fees to fund Fire District Capital Improvements (i.e. apparatus purchase). Regular and ongoing review/update of mitigation fees, Regular and ongoing updates to internal cost analysis to provide for full cost recovery of services		

Source: FFPD

H.6.4. Mitigation Education, Outreach, and Partnerships

Table H-10 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table H-10 FFPD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N	
Natural disaster or safety related school programs	Y	School programs

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
StormReady certification	N	
Firewise Communities certification	Y	
Public-private partnership initiatives addressing disaster-related issues	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
Develop a school fire safe program and a more robust delivery system. Develop a High School Fire Cadet Program (as funds are available). Continued growth of our Firewise Communities working with the Foresthill/Iowa Hill Fire Safe Council. Continued to develop Firewise Communities Developed a Defensible Space Demonstration area for the public to tour 7/24/365 Developed a Ready, Set, Go Program with District specific printed materials Continue ongoing public education programs, Implement new public education programs,		

Source: FFPD

FFPD has many mutual aid agreements and partnerships in place to ensure the safety of the people and property within District Boundaries. Partnerships and/or mutual aid agreements are in place with the following entities:

- CAL FIRE
- USFS
- BLM
- Placer County Sheriff’s Office
- Placer County OES
- California Highway Patrol (CHP)
- American Medical Response (AMR)
- American Red Cross
- Placer County Water Agency

The District works closely with the Foresthill/Iowa Hill fires Safe Council, CAL FIRE, USFS, BLM, and private landowners.

H.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

- Defensible space inspections
- Continual fire safety education
- In process of becoming a Firewise Community
- Firewise workshop
- Firesafe Council
- Business Inspections
- Fire Education in Schools
- Shaded fuel breaks within Foresthill/Iowa Hill areas
- Fuel Reduction Projects

- Ready, Set, Go! Demonstration site.
- Fuels Reduction: Chipper Program

H.7 Mitigation Strategy

H.7.1. Mitigation Goals and Objectives

The FFPD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

H.7.2. Mitigation Actions

The planning team for the FFPD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Climate Change
- Drought & Water Shortage
- Severe Weather: Extreme Heat
- Severe Weather: High Winds and Tornadoes
- Tree Mortality
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Chipper Program for Foresthill FPD

Hazards Addressed: Multi-Hazard (Climate Change, Drought & Water Shortage, Floods: Localized Stormwater, Pandemic, Severe Weather: Extreme Heat, Severe Weather: Freeze and Snow, Severe Weather: High Winds and Tornadoes, Tree Mortality, and Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: With the limited number of chippers and crews a back log of debris removal is accumulating. This receptive fuel bed must be reduced.

Project Description: Increase to number of chippers in the County by providing Foresthill FPD with a chipper, a tow vehicle and a four-person crew and a supervisor. The crew could also double as a hand crew to assist in the suppression of a wildland fire.

Other Alternatives: County to increase the number of chippers and numbers of crews to address the hazard. There is a lot of potential and the mitigation is slower than the desired goal for defensible space and fire severity.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Not sure yet. Big goal/dream with a small agency.

Responsible Agency/ Department/Partners: Foresthill FPD, CalFire, BoR, BLM, USFS, State Parks

Cost Estimate: \$350,000 - \$400,000 (with startup costs).

Benefits (Losses Avoided): Saving lives and property. For the cost of saving one or two homes in the District, we could provide a valuable asset to the reduction of hazards from wildland fires.

Potential Funding: Not researched yet

Timeline: One year

Project Priority (H, M, L): High

Annex I Foresthill Public Utility District

I.1 Introduction

This Annex details the hazard mitigation planning elements specific to Foresthill Public Utility District (FPUD or District), a new participating jurisdiction to the 2021 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to FPUD, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

Note: FPUD participated in the original 2005 Placer County LHMP. A copy of that document could not be located by FPUD, Placer County, or Cal OES. Additionally, staff turnover in the past 16 years has reduced institutional memory of that 2005 Plan. It can be assumed that none of FPUD’s proposed mitigation actions were completed, FPUD’s mitigation priorities at that time are unknown, and that the 2005 Plan was not incorporated into any FPUD planning mechanisms. Development in the District since 2005 was described by FPUD as minimal, and a general description of more recent development in the District is included in Section I.5.2 of this Annex.

I.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table I-1. Additional details on plan participation and District representatives are included in Appendix A.

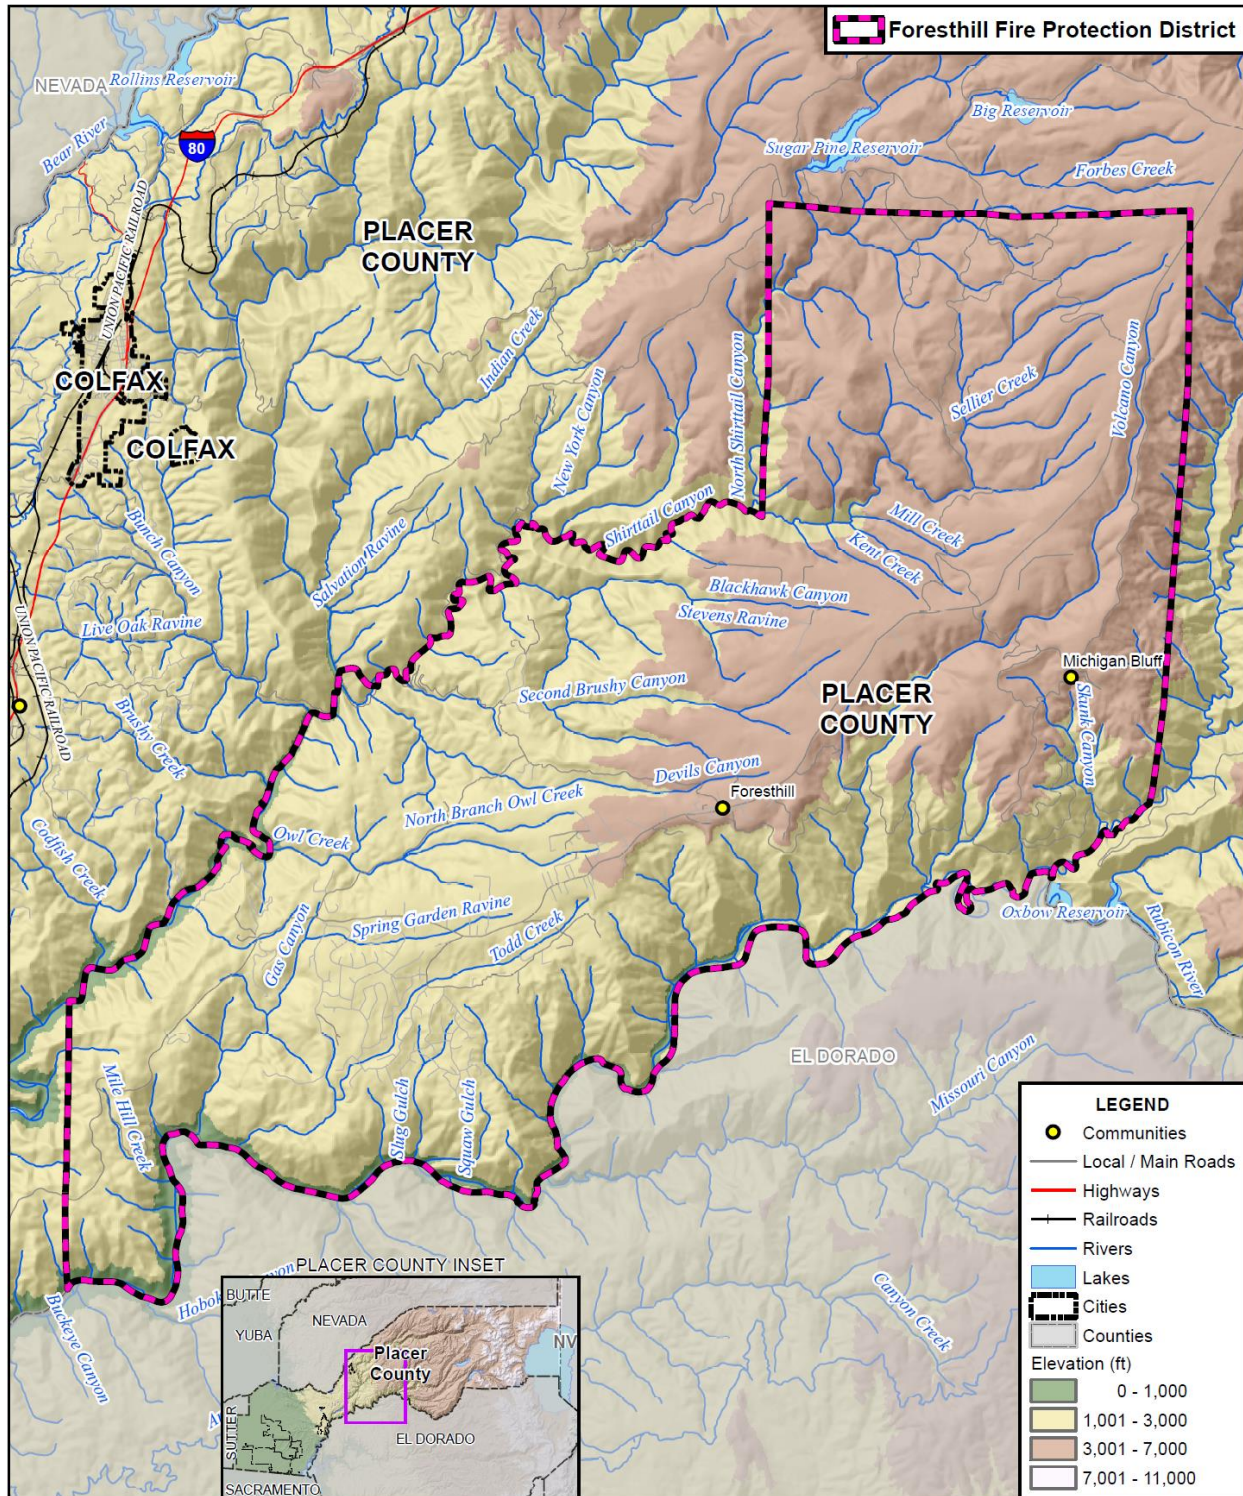

Table I-1 FPUD – Planning Team

Name	Position/Title	How Participated
Henry N. White	General Manager	Lead the effort. Attended meetings. Provided input for annex.

I.3 District Profile

The District profile for the FPUD is detailed in the following sections. Figure I-1 displays a map and the location of the District within Placer County.

Figure I-1 FPUD

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

I.3.1. Overview and Background

Foresthill Public Utility District was formed in 1950 pursuant to the provisions of Section 15501 et seq. of the California Public Utilities Code for the purpose of operating a water system (the "Enterprise"). The District's service area comprises the unincorporated community of Foresthill, California, located in Placer County approximately 60 miles northeast of Sacramento.

The District is governed by a five member Board of Directors and currently employs seven full-time employees and one part-time employee. The District currently incorporates an area of approximately 13,000 acres and contains primarily residential development. The District as of February 1, 2020 provides 2,034 water service connections.

I.4 Hazard Identification

FPUD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table I-2).

Table I-2 FPUD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Limited	Unlikely	Negligible	Low	Low
Avalanche	Limited	Unlikely	Negligible	Low	Low
Climate Change	Limited	Unlikely	Negligible	Low	–
Dam Failure	Limited	Unlikely	Negligible	Medium	Low
Drought & Water Shortage	Limited	Likely	Limited	Medium	Low
Earthquake	Limited	Unlikely	Negligible	Low	Low
Floods: 1%/0.2% annual chance	Limited	Unlikely	Negligible	Low	Low
Floods: Localized Stormwater	Limited	Likely	Negligible	Low	Low
Landslides, Mudslides, and Debris Flows	Limited	Likely	Negligible	Low	Low
Levee Failure	Limited	Unlikely	Negligible	Low	Low
Pandemic	Limited	Unlikely	Negligible	Low	Low
Seiche	Limited	Unlikely	Negligible	Low	Low
Severe Weather: Extreme Heat	Extensive	Highly likely	Negligible	Low	Low
Severe Weather: Freeze and Snow	Extensive	Highly likely	Negligible	Low	Low
Severe Weather: Heavy Rains and Storms	Extensive	Highly likely	Negligible	Low	Low
Severe Weather: High Winds and Tornadoes	Limited	Unlikely	Negligible	Low	Low
Tree Mortality	Extensive	Highly likely	Catastrophic	Low	Low
Wildfire	Extensive	Highly likely	Catastrophic	Low	Low
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

I.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District’s hazards and assess the District’s vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

I.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section I.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table I-2) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

I.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District’s total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the FPU’s assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table I-3 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. FPUD’s physical assets, valued at over \$67 million, consist of the buildings and infrastructure to support the District’s operations.

Table I-3 FPUD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
Sugar Pine Dam	Earth dam	60,000,000	Fire, slide
Water Treatment Plant	Treatment plant	5,000,000	Fire
Headquarters Building	Office building	500,000	Fire
Water Storage Tank	Storage tank	1,500,000	Tree mortality
Total		\$67,000,000	

Source: FPUD

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. The District currently incorporates an area of approximately 13,000 acres and contains primarily residential development. The District as of February 1, 2020 provides 2,034 water service connections.

Natural Resources

FPUD has a variety of natural resources of value to the District. These natural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Historic and Cultural Resources

FPUD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. Growth is occurring at about 2% per year. There are no plans at this time to expand the District service area. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

I.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table I-2 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Dam Failure

Likelihood of Future Occurrence–Unlikely

Vulnerability–Medium

Hazard Profile and Problem Description

Dams are manmade structures built for a variety of uses including flood protection, power generation, agriculture, water supply, and recreation. When dams are constructed for flood protection, they are usually engineered to withstand a flood with a computed risk of occurrence. For example, a dam may be designed to contain a flood at a location on a stream that has a certain probability of occurring in any one year. If prolonged periods of rainfall and flooding occur that exceed the design requirements, that structure may be overtopped or fail. Overtopping is the primary cause of earthen dam failure in the United States.

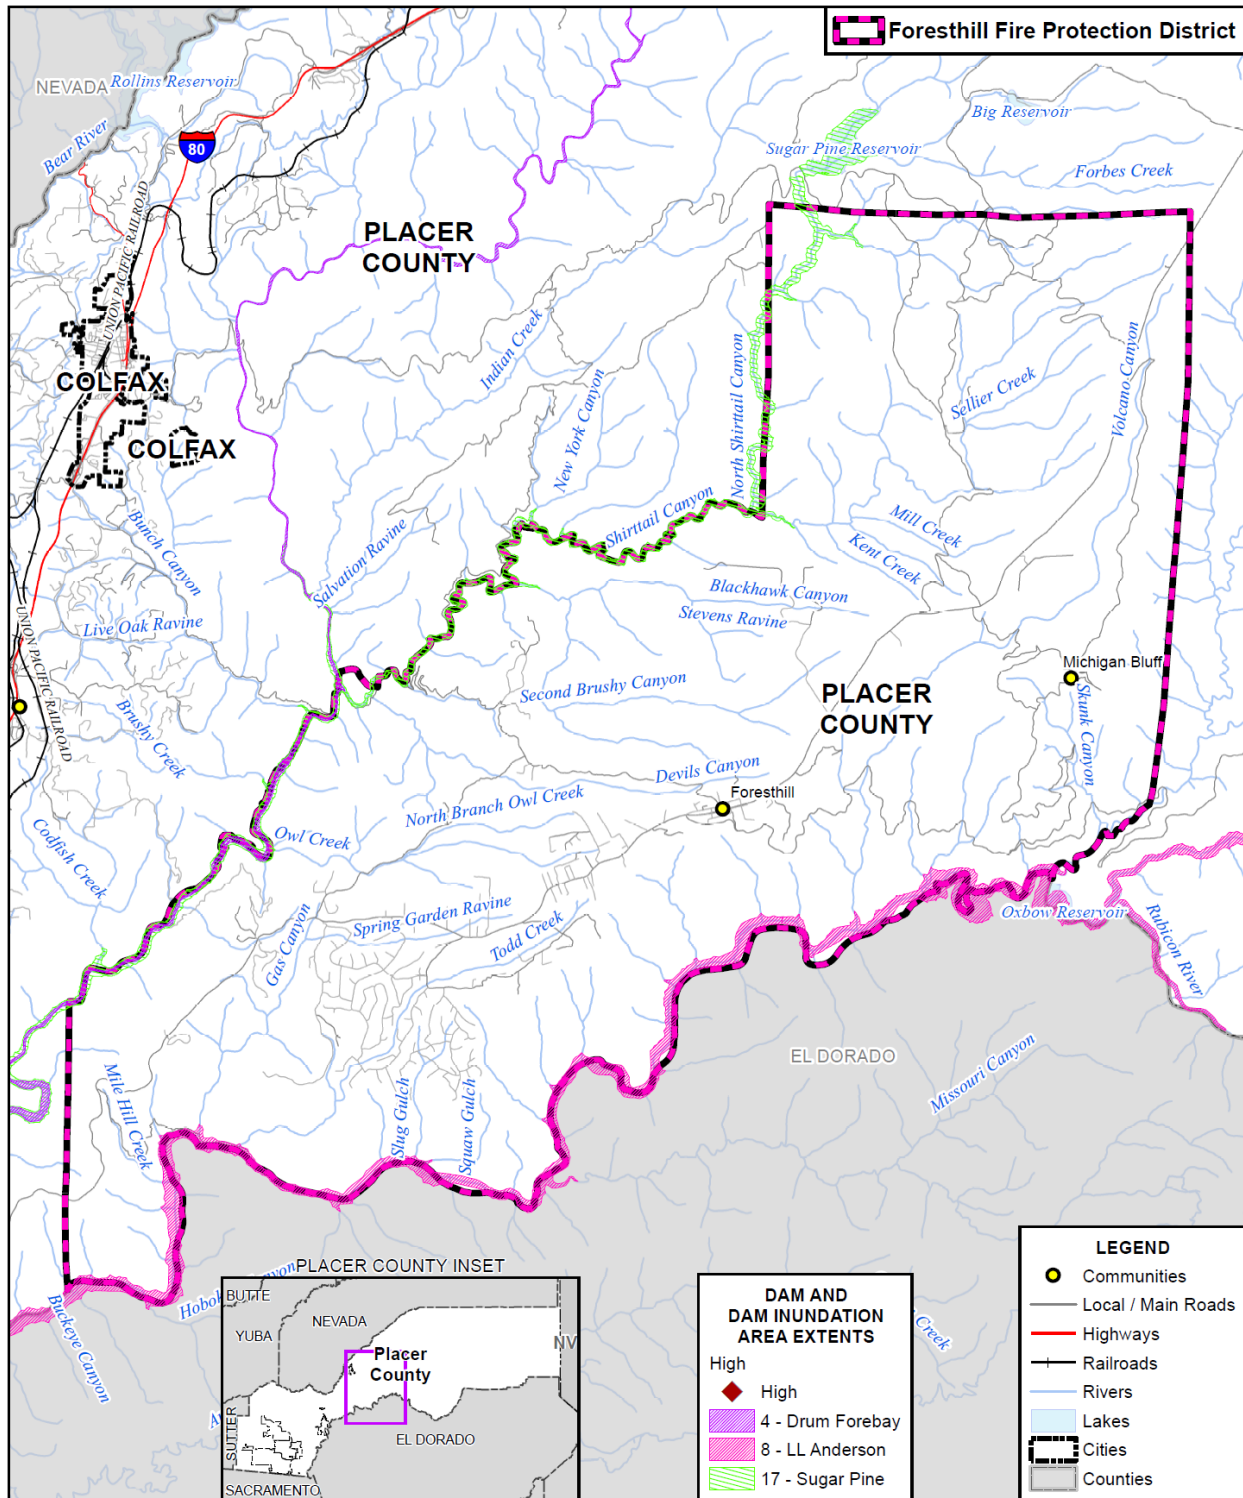

Location and Extent

Dam failure is a natural disaster from two perspectives. First, the inundation from released waters resulting from dam failure is related to naturally occurring floodwaters. Second, a total dam failure would most probably happen as a consequence of the natural disaster triggering the event, such as an earthquake. There is no scale with which to measure dam failure. However, Cal DWR Division of Safety of Dams (DOSD) assigns hazard ratings to dams within the State that provides information on the potential impact should a dam fail. The following two factors are considered when assigning hazard ratings: existing land use and land use controls (zoning) downstream of the dam. Dams are classified in four categories that identify the potential hazard to life and property: Low, Significant, High, and Extremely High. These were discussed in more detail in Section 4.3.9 of the Base Plan.

While a dam may fill slowly with runoff from winter storms, a dam break has a very quick speed of onset. The duration of dam failure is generally not long – only as long as it takes to empty the reservoir of water the dam held back. The District would be affected for as long as the flood waters from the dam failure took to drain downstream.

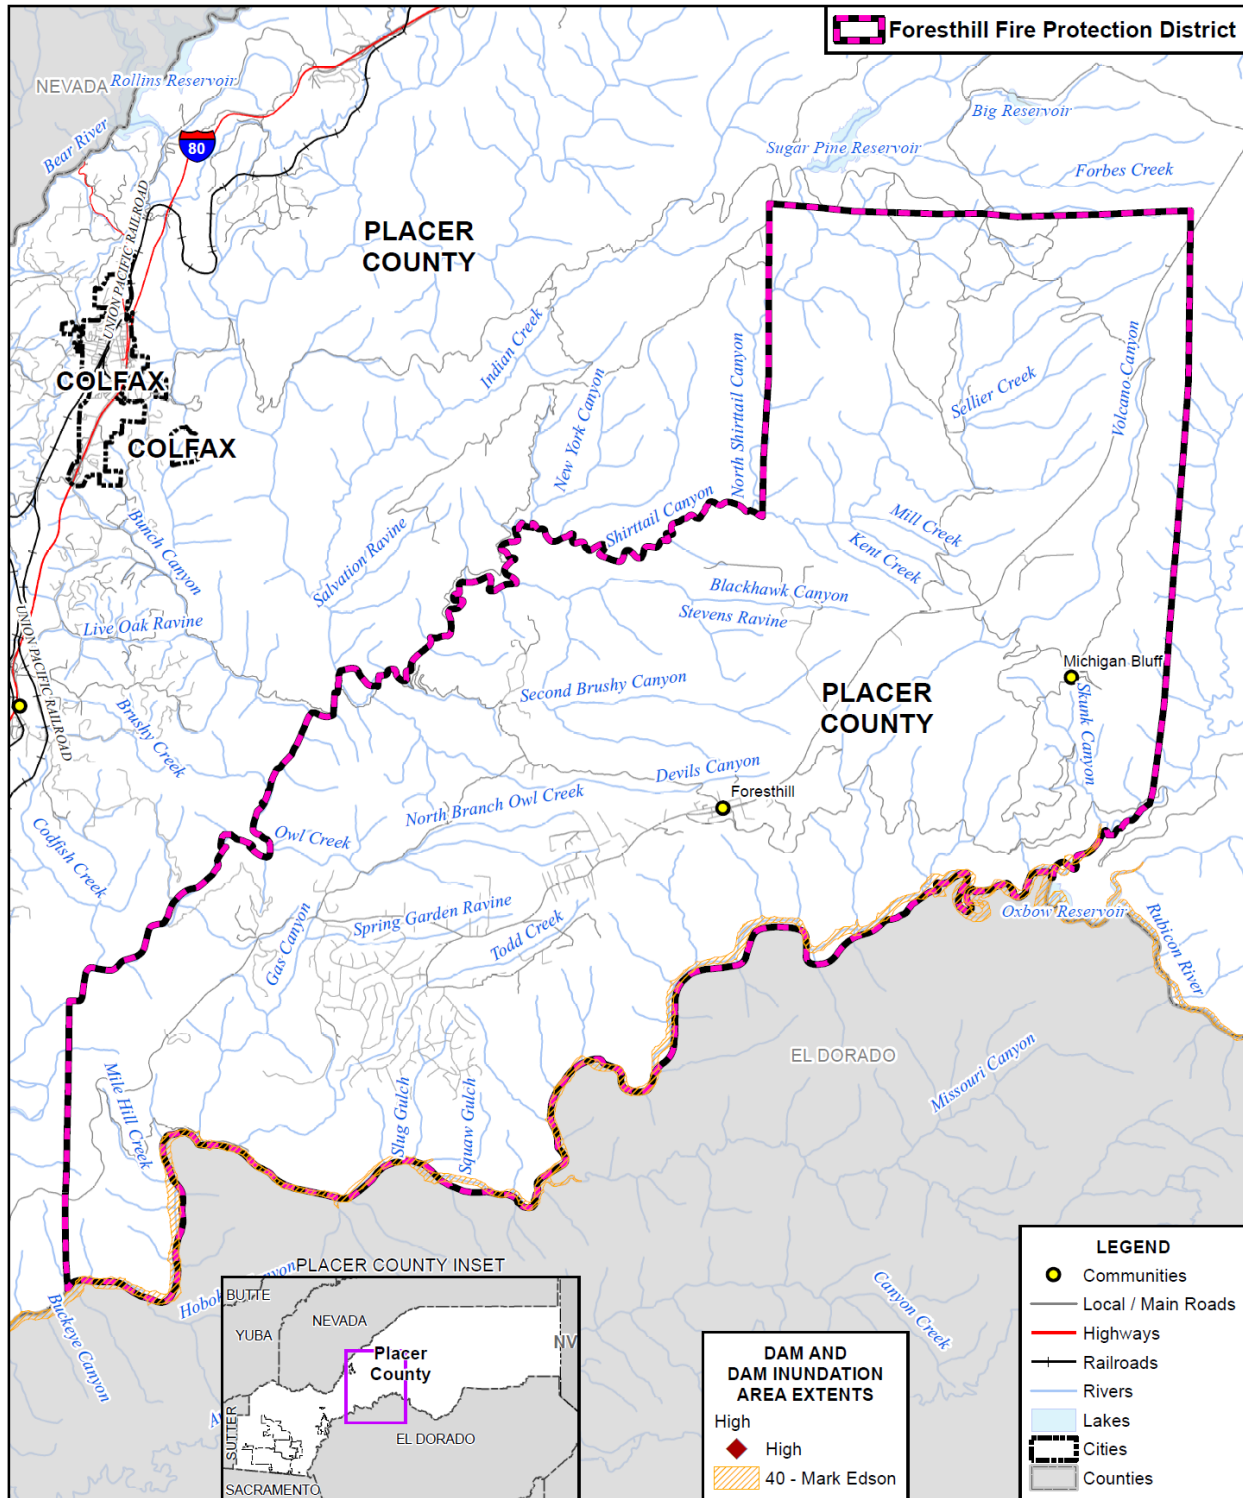

Dams inside the County that can affect the District can be seen on Figure I-2. Dams outside the County that can affect the District can be seen on Figure I-3.

Figure I-2 FPUD – Dam Inundation Areas from Dams Inside the County

Data Source: DWR DSOD Data 2020, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Figure I-3 FPUD – Dam Inundation Areas from Dams Outside the County

Data Source: DWR DSOD Data 2020, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

In addition to these shown above, the Sugar Pine Dam is a zoned earthfill dam constructed in 1982. The dam is 205.1 feet high with a volume of 981,000 cubic yards. The reservoir behind the dam holds 6,922 acre feet. The dam is in excellent condition.

Past Occurrences

There has been no federal or state disaster declarations for dam failure in the County. The District noted no other dam failure occurrences that have affected the District. The District has had two earthquakes in the general area. We followed emergency protocol and inspected the dam. The District found no damage from the earthquakes.

Vulnerability to and Impacts from Dam Failure

Dam failure flooding would vary by community depending on which dam fails and the nature and extent of the dam failure and associated flooding. Impacts to the District from a dam failure flood could include loss of life and injury, flooding and damage to property and structures, damage to critical facilities and infrastructure, loss of natural resources, and all other flood related impacts. Additionally, mass evacuations and associated economic losses can also be significant.

Failure of the dam at Big Reservoir would concern the District. The impact would be to fill and possibly spill Sugar Pine Reservoir.

Assets at Risk

The reservoir and spillway were designed to accommodate a failure.

Drought & Water Shortage

Likelihood of Future Occurrence—Likely

Vulnerability—Medium

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area’s usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table I-4.

Table I-4 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

The District was impacted by the drought in 1977. This drought led to the investment and construction of the Sugar Pine Dam and Reservoir.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

Assets at Risk

All District assets (from Table I-3) are at risk from this hazard.

I.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

I.6.1. Regulatory Mitigation Capabilities

Table I-5 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the FPU.

Table I-5 FPU Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	2011 (?)	Yes
Capital Improvements Plan	2021	yes
Economic Development Plan	?	I think the county has this
Local Emergency Operations Plan	2021	yes
Continuity of Operations Plan	2021	yes
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	2020	Yes
Community Wildfire Protection Plan	?	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)		
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	N	Version/Year:

Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	2019	Rating: 04/4Y
Site plan review requirements	?	
Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
Zoning ordinance		
Subdivision ordinance		
Floodplain ordinance		
Natural hazard specific ordinance (stormwater, steep slope, wildfire)		
Flood insurance rate maps		
Elevation Certificates		
Acquisition of land for open space and public recreation uses		
Erosion or sediment control program		
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District has limited regulatory mitigation capability, and depends on the County to provide regulation. Planning and land management tools assist the district in implementing hazard mitigation activities by have pre-thought necessary activities and responsibilities. Future planning will seek to plan for natural hazards and their mitigation.		

Source: FPUD

I.6.2. Administrative/Technical Mitigation Capabilities

Table I-6 identifies the District department(s) responsible for activities related to mitigation and loss prevention in FPUD.

Table I-6 FPUD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	N	
Mutual aid agreements	N	
Other		
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	N	
Floodplain Administrator	N	

Emergency Manager	Y	Yes
Community Planner	N	
Civil Engineer	Y	Yes
GIS Coordinator	Y	Yes
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Yes
Hazard data and information	Y	Yes
Grant writing	Y	Yes
Hazus analysis	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District could use additional resources to improve and expand mitigation and loss prevention. This includes training staff on mitigation related efforts, as well as seeking coordination with the County and other local agencies on hazard mitigation related items.		

Source: FPUD

I.6.3. Fiscal Mitigation Capabilities

Table I-7 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table I-7 FPUD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Yes, construction, yes
Authority to levy taxes for specific purposes	Y	Yes construction of improvements, yes
Fees for water, sewer, gas, or electric services	Y	Yes, operations, yes
Impact fees for new development	Y	Yes, operations, yes
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	Yes, construction, yes
Incur debt through private activities	Y	Yes, loan repayment/asset acquisition, yes
Community Development Block Grant	?	
Other federal funding programs	Y	Yes, construction, yes
State funding programs	Y	Yes, construction, yes
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District could expand securing debt to fund activities that would mitigate hazards and reduce risk.		

Source: FPUD

I.6.4. Mitigation Education, Outreach, and Partnerships

Table I-8 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table I-8 FPUD’s Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	y	The Foresthill Forum discuss all of these topics
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	y	The district has a public outreach program
Natural disaster or safety related school programs	n	
StormReady certification	n	
Firewise Communities certification	y	
Public-private partnership initiatives addressing disaster-related issues		
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District could allocate additional resources to expand and improve programs designed to reduce risk. The District will seek to increase the outreach done by those supporting the FireWise Community certification. Outreach programs will seek to have a mitigation component in the future.		

Source: FPUD

I.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

- Completion of the Foresthill Road Pipeline (see Figure I-4)

Figure I-4 Foresthill Road Pipeline

Source: FPUD

- Completion of Water Storage Tank (see Figure I-5)

Figure I-5 Water Storage Tank

Source: FPUD

I.7 Mitigation Strategy

I.7.1. Mitigation Goals and Objectives

The FPUD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

I.7.2. Mitigation Actions

The planning team for the FPUD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Dam Failure
- Drought & Water Shortage

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Drought, Dam Failure/ additional of radial gates to dam

Hazards Addressed: Drought and dam failure

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Installing radial gates would address drought issues for the community of Foresthill and strengthen the spillway reducing the possibility of dam failure

Project Description: Installation of radial gates in the Sugar Pine Dam spillway

Other Alternatives: none

Existing Planning Mechanism(s) through which Action Will Be Implemented: Foresthill Public Utility District Capital Improvement Plan and the Foresthill Public Utility District Master Plan

Responsible Agency/ Department/Partners: Foresthill Public Utility District

Cost Estimate: \$10,000,000

Benefits (Losses Avoided): Radial gates would increase storage capacity of Sugar Pine Reservoir by 30% thereby reducing impacts of drought and climate change

Potential Funding: Federal grants and partnerships

Timeline: Project is shovel ready and complete in two years

Project Priority (H, M, L): high

Annex J Nevada Irrigation District

J.1 Introduction

This Annex details the hazard mitigation planning elements specific to the Nevada Irrigation District (NID or District), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to NID, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

J.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table J-1. Additional details on plan participation and District representatives are included in Appendix A.

Table J-1 NID – Planning Team

Name	Position/Title	How Participated
Greg Jones	Assistant General Manager	Oversite and Review
Chip Close	Water Operations Manager	Facility vulnerability and risk assessment as well as historical references
Doug Roderick	Engineering Manager	Capital improvement planning and forecasting
Keane Sommers	Hydroelectric Manager	Facility vulnerability and risk assessment as well as historical references

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the District integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the District incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table J-2.

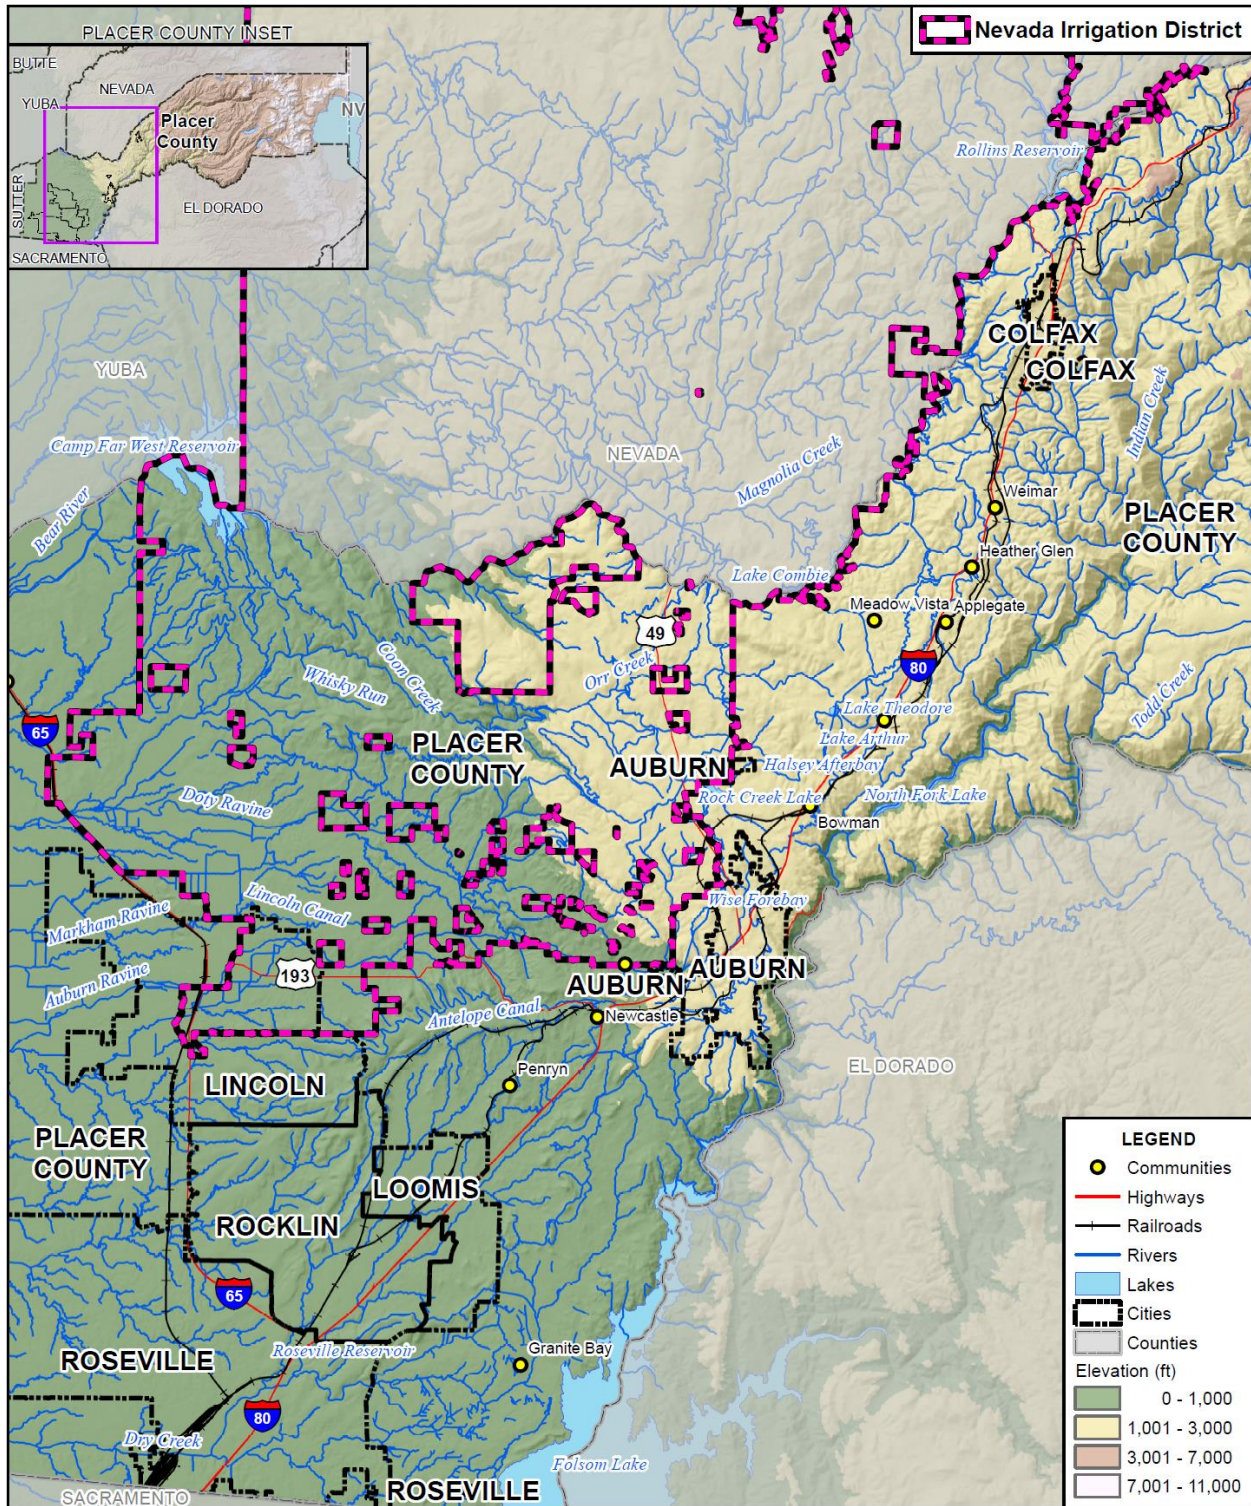

Table J-2 2016 LHMP Incorporation

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
Capital Improvement Planning	Priority of projects were adjusted to meet level of risk

J.3 District Profile

The District profile for the NID is detailed in the following sections. Figure J-1 displays a map and the location of the District within Placer County.

Figure J-1 NID

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

J.3.1. Overview and Background

Formed in 1921, the Nevada Irrigation District is a diversified water resource agency that supplies over 30,000 homes, farms, and businesses in Nevada, Placer and Yuba Counties in the foothills of Northern California's Sierra Nevada Mountains. NID provides service in an expansive geographic area covering 287,000 acres that makes the District one of the largest in the State of California.

The District is organized primarily to supply water for irrigation, municipal, domestic, industrial, and hydroelectric purposes. NID collects water from the mountain snowpack on 70,000 acres of high mountain watershed and stores it in an extensive system of reservoirs. Water flows to customers in the foothills through over 500 miles of canals and another 400 miles of pipeline. Along the path, it is used to generate clean hydroelectric energy and to provide public recreational opportunities at NID's multiple reservoirs and campgrounds.

The highest elevation on NID mountain watershed is the peak of 8,373-foot English Mountain which rises east of Bowman Reservoir. The District's highest reservoir is French Lake at 6,835 feet. The District's lowest elevation water service is located about 100 miles to the southwest, at 150 feet above sea level, south of Lincoln in Placer County.

NID has precipitation records for Bowman Reservoir (elev. 5,650 ft.) dating back to 1929. The 69.2-inch annual average precipitation at Bowman compares to an annual average of 56 inches at 2,700 feet near Nevada City and 52 inches at 2,400 feet in Grass Valley.

Irrigation Water

NID has supplied an average 150,000 acre-feet of water per year. About 90 percent of this total is used for local agriculture. NID serves approximately 5,600 raw water customers. Most purchase their water on a seasonal basis — the six-month irrigation season normally runs from on or about April 15 through October 14. Some irrigation customers purchase both summer and winter water for year-around service.

Irrigation water is used to irrigate pasture, golf courses, gardens, nurseries, orchards, and vineyards for both commercial and home production. Grapes, apples, peaches, nuts, berries, corn, rice, wheat, and oats are among the many crops grown with NID water.

Many customers realize other benefits from NID Irrigation water including filling ponds and reservoirs for stock watering, fire suppression, and recreation. Availability of irrigation water is an important factor in the preservation of open space, and greenbelt areas. There are an estimated 97,000 irrigable acres in the Nevada Irrigation District, about a third of which are presently in irrigation.

Treated Drinking Water

Through the years, NID service has changed along with the communities it supplies. The District continues to supply irrigation water, as it has since the 1920s, but today's demand is for piped and treated drinking water.

NID's treated water service areas are located in and around Grass Valley and Nevada City, Alta Sierra, Lake of the Pines, Penn Valley, Lake Wildwood, Smartville, and North Auburn areas.

Generally, treated water is available in the more populated areas, as it can be very expensive to extend treated water main lines into rural areas where there are few customers to share the costs. In recent years, the District has been successful in working with local property owners to form local water quality improvement districts.

The transition to treated drinking water began in the late 1960s and early 1970s when NID constructed its first water treatment plants. Today, the District operates a network of six modern water treatment plants in Nevada, Placer, and Yuba counties.

NID presently produces about 3 billion gallons — approximately 9,000 acre-feet — of treated drinking water per year. The district's treatment plants are operated by state-licensed and certified technicians. Water treatment processes include chlorination, coagulation, flocculation, sedimentation, and filtration.

NID treated water meets and exceeds standards set by the California Department of Health Services. As required by state law, NID produces an annual water quality report, the Consumer Confidence Report, which is distributed each spring to each treated water customer.

NID's flushing program is conducted annually in the winter months and is designed to keep treated water pipelines clean and ensure a fresh, high quality water supply.

Recreation

The Nevada Irrigation District manages 29 reservoirs in the foothills and mountains of the Northern Sierra providing recreational opportunities such as hiking, camping, boating, fishing, and swimming.

At Rollins and Scotts Flat reservoirs, NID provides public parks, trails, campgrounds and beaches for the community's enjoyment. Higher up in the mountains, NID maintains and operates campgrounds in the Jackson Meadows and Bowman Lake areas.

Sierra Foothill Recreation

Camping, fishing, swimming, sunning, boating, water skiing, sailing, kayaking and other activities are popular at both Rollins and Scotts Flat reservoirs in the Sierra foothills. Day use parks, campgrounds and beaches are operated by NID and in some cases, by private operators, under contract with NID.

Scotts Flat is situated among the tall pines at the 3100-foot elevation nine miles east of Nevada City via Highway 20 and Scotts Flat Road. It offers 169 campsites at two large campgrounds, plus a group camp. Across the lake, accessible via Red Dog and Quaker Hill Roads from Nevada City, is the Cascade Shores Day Use Area. Scotts Flat is a popular spot for swimming, boating and water Skiing

Rollins Reservoir, located at the 2100-foot elevation off Highway 174 between Grass Valley and Colfax, has four independently operated campgrounds. Long Ravine, Greenhorn, Orchard Springs and Peninsula

offer a combined 250 campsites and a complete range of services including stores, restaurants, fuel sales and rentals.

Sierra Mountain Recreation

At higher elevations in the Sierras, NID maintains and operates campgrounds and recreational facilities in the Jackson Meadows – Bowman Lake areas.

Jackson Meadows features several campgrounds, picnic day use sites and boat ramps.

At Bowman Lakes area, campgrounds are located at Bowman, Canyon Creek, Sawmill and Faucherie Lakes in the Bowman corridor.

The primary recreation season in the high mountain areas generally runs from Memorial Day through Labor Day, depending on weather.

We Partner for Trails

Trails help to cultivate a healthy community. NID partners with the Bicyclists of Nevada County (BONC), Youth Bicyclists of Nevada County (YBONC) and the Bear Yuba Land Trust to provide multiuse trails for recreation. The trails we provide at Scotts Flat Lake and Rollins Lake attract hikers and bicyclists from throughout the region.

Hydroelectric

NID is a leader among northern California water agencies in the production of clean, renewable hydropower. Operating seven hydropower plants, it generates enough electricity to supply the District's own energy needs plus that of about 60,000 homes.

NID began producing electricity in 1965 with the completion of the \$65 million Yuba-Bear Power Project. The original project included the Chicago Park and Dutch Flat powerhouses and, in 1980, the Rollins and Bowman powerhouses were added. Additional small power plants were added during the 1980s at Scotts Flat and Combie reservoirs to make use of existing water releases.

The District has power sales agreements that market NID's electricity to the Pacific Gas & Electric Company and the Northern California Power Agency. NID's Hydropower operations are a huge win for customers. In addition to contributing millions in revenues from power sales to offset water rates for the customer, Hydro also covers all of the costs of upper division water storage, conveyance, delivery, maintenance, and operations from the headwaters of the Middle and South Yuba Rivers, Bear River, Canyon Creek, and Deer Creek watersheds through the District's mid-elevation storage reservoirs of Scotts Flat, Rollins and Combie.

NID's hydropower facilities include 13 reservoirs and 20.75 miles of pipes, flumes, tunnels and open ditch canals.

J.4 Hazard Identification

NID identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table J-3).

Table J-3 NID—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Significant	Highly Likely	Limited	Medium	Medium
Avalanche	Limited	Likely	Limited	Medium	Medium
Climate Change	Extensive	Highly Likely	Critical	High	High
Dam Failure	Significant	Unlikely	Critical	High	Medium
Drought & Water Shortage	Extensive	Occasional	Critical	High	High
Earthquake	Extensive	Occasional	Critical	Medium	Low
Floods: 1%/0.2% annual chance	Limited	Occasional	Critical	High	Medium
Floods: Localized Stormwater	Limited	Highly Likely	Limited	Medium	Medium
Landslides, Mudslides, and Debris Flows	Limited	Occasional	Limited	Medium	Medium
Levee Failure	Limited	Unlikely	Limited	Medium	Medium
Pandemic	Extensive	Occasional	Critical	High	Medium
Seiche	Limited	Unlikely	Limited	Low	Medium
Severe Weather: Extreme Heat	Extensive	Highly Likely	Limited	Medium	High
Severe Weather: Freeze and Snow	Extensive	Highly Likely	Critical	Medium	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Highly Likely	Critical	High	Medium
Severe Weather: High Winds and Tornadoes	Limited	Highly Likely	Critical	Medium	Low
Tree Mortality	Extensive	Highly Likely	Limited	Medium	High
Wildfire	Extensive	Highly Likely	Critical	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

J.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District’s hazards and assess the District’s vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

J.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section J.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table J-3) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

J.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District’s total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the NID’s assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table J-4 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. NID’s physical assets, valued at over \$1.4 billion, consist of the buildings and infrastructure to support the District’s operations.

Table J-4 NID Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Hazard Info
Rollins Power House	Critical Facilities	\$19,170,815	Earthquake, Flood, Wildfire, Tree Mortality
Combie South Power House	Critical Facilities	\$5,334,820	Earthquake, Flood, Wildfire, Tree Mortality
Dutch Flat Afterbay	Critical Facilities	\$400,000,000	Earthquake, Flood, Fire
Rollins Reservoir	Critical Facilities	\$500,000,000	Earthquake, Flood, Wildfire, Tree Mortality
Combie Reservoir	Critical Facilities	\$250,000,000	Earthquake, Flood, Wildfire, Tree Mortality
North Auburn Water Treatment Plant	Critical Facilities	\$3,713,610	Earthquake, Flood, Wildfire, Freeze and Snow
Water Canal System	Critical Facilities	\$66,361,517	Earthquake, Flood, Freeze and Snow, Wildfire, Tree Mortality, Landslide
Orr Creek Reservoir	Critical Facilities	\$2,000,000	Earthquake, Flood
Pickett Reservoir	Critical Facilities	\$100,000	Earthquake, Flood
Buildings and Warehouses	Critical Facilities	\$2,000,000	Earthquake, Flood, Wildfire, Tree Mortality
Administration Buildings	Critical Facilities	\$4,450,00	Earthquake, Flood, Wildfire, Tree Mortality
Pipelines and Tanks	Critical Facilities	\$34,110,630	Earthquake, Flood, Wildfire, Tree Mortality
Other assets	Critical Facilities	\$147,000,000	Earthquake, Flood, Wildfire
Total		\$1,429,795,842	

Source: NID

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. NID provides domestic water service to over 19,500 service connections representing a population of over 100,000,000 people. In addition, the District provides wholesale water utilized by other

municipalities to supply another 6,000 plus homes. The District also provides irrigation water to more than 5,500 farms and properties throughout Placer, Nevada and Yuba Counties.

Natural Resources

NID has a variety of natural resources of value to the District. Several state or federally listed species may be found within the District boundary. These are identified, along with other species of concern found in the District, in Table J-5 and Table J-6.

Table J-5 Plant Species of Concern in the Nevada Irrigation District

Name	Status	Habitat	Potential Occurrence
Dwarf downingia <i>Downingia pusilla</i>	CNPS 2.2	Vernal Pools in valley foothill grasslands	Unlikely to occur. No appropriate habitat in the project area. Nearest known occurrence 2.2 air miles northwest of downtown Lincoln, 1.2 road miles south of Wise Road/Hwy. 65 intersection.
Legenere <i>Legenere limosa</i>	CNPS 1B.1	Vernal pools and swales, seasonal marshes, artificial ponds, floodplains of intermittent streams, and other seasonally inundated habitats.	May occur in floodplains of intermittent streams in the project area. Known from only two occurrences in the project vicinity. One located north of Pleasant Grove Creek, south of Placer Boulevard, east of Highway 65. The second is at the Orchard Creek Conservation Bank approximately 3 miles southwest of Lincoln (Jones & Stokes 2002).
big-scale balsamroot <i>Balsamorhiza macrolepis</i> var. <i>macrolepis</i>	CNPS 1B.2	Chaparral, cismontane woodland and valley and foothill grassland, and vernal moist meadows on sandstone, serpentine, or basalt outcrops. From 300 to 4,600 feet in elevation.	Added to table August 2009, no analysis for the project area completed.
Stebbins's morning-glory <i>Calystegia stebbinsii</i>	FE, CE, CNPS 1B.1	Chaparral (openings), cismontane woodland, serpentinite or gabbroic. 600–2,400 ft.	Unlikely to occur. No appropriate habitat present in the project area. This plant is known from fewer than 15 occurrences in specific, isolated areas of Nevada and El Dorado counties (CDFG 2004).
Dubious pea <i>Lathyrus sulphureus</i> var. <i>argillaceus</i>	CNPS 3	Cismontane woodland, chaparral, lower and upper montane coniferous forest. Usually full sun to part shade, woodland openings. 500–1,000 ft.	May occur in woodland habitats on the project site.
Ahart's Dwarf Rush <i>Juncus leiospermus</i> var. <i>ahartii</i>	CNPS 1B.2	Vernal pool margins and mesic valley and foothill grassland areas at elevations of 30–100 meters.	May occur in non-native grassland habitats in the project area. Reported in Placer County only from one occurrence at the Lincoln Airport.

Name	Status	Habitat	Potential Occurrence
Red Bluff Dwarf Rush <i>Juncus leiospermus</i> var. <i>leiospermus</i>	CNPS 1B.1	Meadows and seeps, vernal pools, and vernal mesic areas in chaparral, cismontane woodland, and valley and foothill grassland from 115 to 3,350 feet.	May occur in woodland and non-native grasslands habitats. Known from north of Roseville in 1982, but was relocated in 1997 (CNDDDB 2002).
Butte County fritillary <i>Fritillaria eastwoodiae</i>	CNPS 3	Chaparral, cismontane woodland, lower montane coniferous forest (openings), wet and dry slopes red clay or sandy loam. 100–5,000 ft.	May occur in woodland habitats on the project site.
Brandegee’s clarkia <i>Clarkia biloba</i> ssp. <i>brandegeae</i>	CNPS 1B.2	Chaparral, cismontane woodland, often roadcuts. 900–3,000 ft.	May occur in woodland habitats on the project site. The nearest occurrences are in the Lake Combie Quad along the Bear River (CDFG 2004).
Boggs Lake Hedge-hyssop <i>Gratiola heterosepala</i>	CE, CNPS 1B.1	Foothill Riparian	May occur in riparian habitat present in the project area. Known from only three occurrences in the project vicinity. Two of these occurrences are located between Rocklin and Roseville; the third is located just north of Lincoln (Placer County 2003).
Pincushion navarretia <i>Navarretia myersii</i> ssp. <i>myersii</i>	CNPS 1B.1	Vernal pools, valley and foothill (non-native) grasslands in clay soils. 66–1,083 feet	Northern limits of City of Lincoln. Exact location unknown (needs more fieldwork).

Status Codes:

Federal FE = Federally listed as Endangered FT = Federally listed as Threatened FC = Federal Candidate species	State CE = California listed as Endangered CT = California listed as Threatened CR = California listed as Rare CSC = California Species of Concern CFP = California Fully Protected	California Native Plant Society 1B = rare, threatened or endangered in California and elsewhere. 2 = rare in California but more common elsewhere. 3 = need more information 4 = plants of limited distribution; a watch list. _1 = Seriously endangered in California (over 80% of occurrences threatened / high degree and immediacy of threat) _2 = Fairly endangered in California (20-80% occurrences threatened) _3 = Not very endangered in California (<20% of occurrences threatened, or no current threats known)
---	--	--

Status and habitat information from California Natural Diversity Database (CDFG 2004), California Native Plant Society Electronic Inventory (CNPS 2003), and USFWS Official Species Lists.

¹Based on table presented in the Lincoln Area Water Treatment Plant Planning and Site Study (NID 2005). Updated by Robertson-Bryan, Inc. for internal use only by NID (August 2009)

Table J-6 Wildlife Species of Concern in the Nevada Irrigation District

Name	Status	Habitat	Potential Occurrence
Invertebrates			
Vernal pool fairy shrimp <i>Branchinecta lynchi</i>	FT	Found in vernal pools (seasonal wetlands)	Unlikely to occur. No appropriate habitat present.
Vernal pool tadpole shrimp <i>Lepidurus packardii</i>	FE –	Vernal pools containing clear to highly turbid water.	Unlikely to occur. No appropriate habitat present.
Valley elderberry longhorn beetle <i>Desmocerus californicus dimorphus</i>	FT –	Associated with various species of elderberry shrubs (<i>Sambucus</i> spp.); generally occurs along waterways and in floodplains.	May occur if elderberry shrubs are present in the project area. Nearest known occurrences in the vicinity of the Lincoln airport and Lincoln Rodeo Grounds.
Fish			
Delta smelt <i>Hypomesus transpacificus</i>	FT CT	Found only in the Sacramento-San Joaquin Estuary and they reside primarily in the interface between salt and freshwater. Decline in population due in large part to reductions in delta water outflow.	Unlikely to occur. Project is located outside of species' known distribution.
Longfin smelt <i>Spirinchus thaleichthys</i>	– CT, CSC	In the Sacramento-San Joaquin estuary adults and juveniles can be found in water ranging from nearly pure sea water to completely fresh water. Adult and juvenile longfin smelt occupy mostly the middle or bottom of the water column in the salt or brackish water portions of the estuary, although larval smelt are concentrated in near-surface brackish waters. Spawning takes place in fresh water, over sandy-gravel substrates, rocks, and aquatic plants.	Unlikely to occur. Project is located outside of species' known distribution.
Central Valley steelhead <i>Oncorhynchus mykiss irideus</i>	FT –	Found in tributaries to the San Francisco Bay, including the south Bay. Pass through the San Francisco Estuary during migration to streams for spawning, and during outmigration to the ocean. Spawn in small streams and tributaries with cold, clean water flowing over graveled bottoms and deep pools.	Rainbow trout/steelhead adults and fry have been seen in Coon Creek, Auburn Ravine, Dry Creek, Secret Ravine, and Miners Ravine (CALFED Bay-Delta Program 2000).
Central Valley spring-run chinook salmon <i>Oncorhynchus tshawytscha</i>	FT CT	Found in tributaries to the San Francisco Bay. Pass through the San Francisco Estuary during migration to streams for spawning, and during outmigration to the ocean. Spawn in well oxygenated water in swift, shallow riffles, or at edges of fast runs with loose gravel.	Unlikely to occur. Project is located outside of species' known distribution.

Name	Status	Habitat	Potential Occurrence
Sacramento winter-run chinook salmon <i>Oncorhynchus tshawytscha</i>	FE CE	Found in tributaries to the San Francisco Bay. Pass through the San Francisco Estuary during migration to streams for spawning, and during outmigration to the ocean. Spawn in well oxygenated water in swift, shallow riffles, or at edges of fast runs with loose gravel.	Unlikely to occur. Project is located outside of species' known distribution.
Central Valley fall/late fall-run chinook salmon <i>Oncorhynchus tshawytscha</i>	– CSC	Found in tributaries to the San Francisco Bay, including the south Bay. Pass through the San Francisco Estuary during migration to streams for spawning, and during outmigration to the ocean. Spawn in well oxygenated water in swift, shallow riffles, or at edges of fast runs with loose gravel.	The Bear River supports an occasional run of adult fall-run chinook salmon in years when flows are sufficient to provide passage (Yoshiyama et al. 1996).
Green sturgeon <i>Acipenser medirostris</i>	FT CSC	In the Sacramento River, adult sturgeon are in the river, presumably spawning, when temperatures range between 8-14°C. Preferred spawning substrate likely is large cobble, but can range from clean sand to bedrock.	Unlikely to occur. Project is located outside of species' known distribution.
Amphibians			
California tiger salamander <i>Ambystoma californiense</i>	FT CSC	Breeds in freshwater ponds or vernal pools, in association with upland areas with small mammal burrows	Unlikely to occur. Project is located outside of species' known distribution.
Western spadefoot toad <i>Spea hammondi</i>	– CSC	Requires vernal pools and seasonal wetlands below 4,500 feet that lack predators for breeding. Also occurs in grassland habitat and occasionally in valley-foothill oak woodlands and orchards.	Unlikely to occur. Project is located outside of species' known distribution.
California red-legged frog <i>Rana aurora draytonii</i>	FT CSC	Breeds in quiet streams and permanent, deep, cool ponds with overhanging and emergent vegetation below 5,200 feet elevation. Known to occur adjacent to breeding habitats in riparian areas, heavily vegetated streamside shorelines, and non-native grasslands. Sierran streams historically supported populations of red-legged frog; however, these populations have been eliminated.	Unlikely to occur. Project supports minimal suitable habitat and species is not known from the project vicinity. Project area is not designated by USFWS as critical habitat or a core recovery unit. However, the project area is in the historical range of the species. Nearest known occurrence is in El Dorado National Forest, near Michigan Bluff (CNDDDB 2004).
Foothill yellow-legged frog <i>Rana boylei</i>	– CSC	Inhabits valley and foothill oak woodland, riparian forest, ponderosa pine, mixed conifer, coastal scrub, mixed chaparral, and wet meadows. Breeds in rocky streams with cool, clear water from 0 to 4,500 feet.	Appropriate habitat present in intermittent drainages within the proposed project site. Nearest known occurrences are located in Missouri Creek Canyon in Tahoe National Forest and Greenhorn Creek, where two adults were detected in 1999 (CDFG 2004).

Name	Status	Habitat	Potential Occurrence
Reptiles			
Western pond turtle <i>Actinemys marmorata</i>	– CSC	Occurs up to 6,000 feet in perennial wetlands and slow moving creeks and ponds with overhanging vegetation. Requires suitable basking sites such as logs and rocks above the waterline.	Appropriate habitat present in Orr Creek Reservoir and stock ponds located within the project area. Nearest known occurrences are located 4 mi. WNW of Newcastle and on Wolf Creek in Nevada County (CDFG 2004).
California horned lizard <i>Phrynosoma coronatum frontale</i>	– CSC	Occurs in riparian woodlands and annual grasslands, exposed sandy-gravelly substrate with scattered shrubs, and clearings from 0 to 6,500 feet.	Appropriate habitat present in the non-native grasslands in the project area. Nearest known occurrences are 2.5 miles west of Highway 49 and 20 Junction in Nevada City and on Alta Vista Road in Grass Valley (CDFG 2004).
Giant garter snake <i>Thamnophis gigas</i>	FT CT	Primarily associated with marshes and sloughs, less with slow-moving creeks, and absent from larger rivers. Nocturnal retreat is holes, especially mammal burrows, crevices, and surface objects. During the day the giant garter snake often basks on emergent vegetation such as cattails and tules.	Unlikely to occur. Project is located outside of species' known distribution.
Birds			
White-tailed (black shouldered) kite <i>Elanus leucurus</i>	– CFP	Inhabits herbaceous and open stages of most habitats mostly in cismontane California. Forages in undisturbed, open grasslands, meadows, farmlands and emergent wetlands.	Appropriate nesting and foraging habitat present within the project area.
Northern harrier (nesting) <i>Circus cyaneus</i>	– CSC	Frequents meadows, grasslands, open rangelands, desert sinks, fresh and saltwater emergent wetlands. Mostly found in flat, or hummocky, open areas of tall, dense grasses, moist or dry shrubs, and edges for nesting, cover, and feeding.	May forage in non-native grasslands and nest in the project area.
Swainson's hawk <i>Buteo swainsoni</i>	BCC CT	Breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley. Forages in adjacent grasslands, suitable grain or alfalfa fields, or livestock pastures.	Unlikely to occur. Project is located outside of species' known distribution.
Ferruginous hawk (wintering) <i>Buteo regalis</i>	BCC –	Winter visitor along the coast from Sonoma County to San Diego County, eastward to the Sierra Nevada foothills and southeastern deserts, the Inyo-White Mountains, the plains east of the Cascade Range, and Siskiyou County. Prefers open terrain, plains, and foothills. Does not nest in California.	Winter Visitor. May forage in non-native grasslands in the project area.

Name	Status	Habitat	Potential Occurrence
Bald eagle <i>Haliaeetus leucocephalus</i>	FD (Delisted 7/9/07) CE, CFP (nesting and wintering)	Local winter migrant to various California lakes. Most of the breeding population is restricted to northern counties. Regular winter migrants to the region.	Foraging habitat present in Combie Reservoir.
American peregrine falcon <i>Falco peregrinus anatum</i>	Former FE (Delisted on 8/20/99), BCC CE, CFP (nesting)	Breeds in woodlands, forests, coastal habitats, and riparian areas near wetlands, lakes, rivers, or other water on high cliffs, banks, dunes, or mounds	Unlikely to occur. No appropriate habitat present in the project area.
California black rail <i>Laterallus jamaicensis</i>	BCC CFP, CT	Forages and nests in tidal emergent wetlands dominated by pickleweed or in brackish marshes supporting bulrushes and pickleweed; Usually found in immediate vicinity of tidal sloughs.	Unlikely to occur due to lack of suitable habitat. Previously unknown populations were recently discovered in the foothills of Nevada County (Tecklin 1990). Known to occur in isolated marshes along Garden Bar Road, McCourney Road, and in and near Spenceville Wildlife Area (CDFG 2004).
Mountain plover <i>Charadrius montanus</i>	BCC CSC	Short grasslands and plowed fields with little vegetation, and open sagebrush areas of the Central Valley from Sutter and Yuba counties southward.	Unlikely to occur. Project is located outside of species' known distribution.
Long-billed curlew <i>Numenius americanus</i>	BCC	Found in wet meadow habitat in northeastern California in Siskiyou, Modoc, and Lassen counties. Winter visitor along the California coast and in the Central and Imperial valleys.	Winter Visitor. May forage in wet meadows in the project area.
Yellow-billed cuckoo <i>Coccyzus americanus</i>	FC, BCC CE	Inhabits extensive deciduous riparian thickets or forests with dense, low-level or understory foliage, and which abut on slow-moving watercourses, backwaters, or seeps. Willow almost always a dominant component of the vegetation.	Unlikely to occur. Project is located outside of species' known distribution.
Western burrowing owl <i>Athene cunicularia</i>	BCC CSC (Burrow sites.)	Open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably the California ground squirrel.	Unlikely to occur. Project is located outside of species' known distribution.

Name	Status	Habitat	Potential Occurrence
Vaux's swift <i>Chaetura vauxi</i>	– CSC (nesting)	Prefers redwood and Douglas fir habitats with nest sites in large, hollow trees and snags, especially tall, burned-out stubs. Forages over moist terrain and habitats, preferring rivers and lakes.	Unlikely to occur. Project is located outside of species' known distribution.
Black swift <i>Cypseloides niger</i>	BCC CSC (nesting)	Breeds locally in Sierra Nevada and Cascades. Nests in moist crevices or caves, or on cliffs near waterfalls in deep canyons. Forages widely over many habitats; seems to avoid arid regions.	Unlikely to occur. Project is located outside of species' known distribution.
Lewis' woodpecker <i>Melanerpes lewis</i>	BCC (nesting)	Winter resident in open oak savannas, broken deciduous, and coniferous habitats with brushy understory. Uses logged and burned areas. Winters in the Central Valley, Modoc Plateau, and the Transverse and other ranges in Southern California. Breeds locally along eastern slopes of the Coast Ranges, and in Sierra Nevada, Warner Mts., Klamath Mts., and in the Cascade Range.	Winter Visitor. May forage in the project area.
Little willow flycatcher <i>Empidonax traillii brewsteri</i>	– CE (nesting)	Wet meadow and montane riparian habitats from 2,000 to 8,000 feet. Breeding seldom occurs below 5,000 feet. Most often occurs in broad, open river valleys or large mountain meadows with lush growth of shrubby willows	Unlikely to occur. Project is located outside of species' known distribution.
Bank swallow <i>Riparia riparia</i>	– CT (nesting)	Migrant found primarily in riparian and other lowland habitats in California west of the deserts. Requires vertical banks and cliffs with fine-textured or sandy soils near streams, rivers, ponds, lakes, and the ocean for nesting. Feeds primarily over riparian areas during breeding season and over grassland and cropland during migration.	Unlikely to occur. Project is located outside of species' known distribution.
Yellow warbler (nesting) <i>Dendroica petechia brewsteri</i>	– CSC	Uncommon nester over most of California, except the Central Valley, Mojave Desert, and high elevations of the Sierra. Winters along the lower Colorado River and in parts of Imperial and Riverside counties. Nests in riparian habitats dominated by willows, cottonwoods, sycamores, or alders or in mature chaparral. May also use oaks, conifers, and urban areas near streams.	May occur in woodland and riparian habitats in the project area

Name	Status	Habitat	Potential Occurrence
Yellow-breasted chat (nesting) <i>Icteria virens</i>	– CSC	Uncommon migrant in California. Nests in a few locations such as Sweetwater and Weber Creeks, El Dorado County; Pit River, Shasta County; Russian River, Sonoma County; Little Lake Valley, Mendocino County; and upper Putah Creek, Yolo County. Nests in dense riparian habitats dominated by willows, alders, Oregon ash, tall weeds, blackberry, and grape.	May occur in woodland and riparian habitat in the project area. Documented nesting at Little Wolf Creek, Bear River, Dry Creek, Indian Springs Creek, Deer Creek, and the Middle and South Yuba River (Nevada Co. Planning Dept. 2002).
Modesto song sparrow <i>Melospiza melodia mailliardi</i>	– CSC	Found in a variety of habitats including: riparian willow thickets, valley oak riparian with an understory of blackberry, ruderal areas along levees and irrigation canals, and cattail and tule marshes.	May occur in riparian habitats in the project area. Known to occur in western Placer County and adjacent Sierra foothill counties (Grinnell and Miller 1944; Gardali 2002).
Grasshopper sparrow <i>Ammodramus savannarum</i>	– CSC	Occurs in dry, dense grasslands, especially those with a variety of grasses and tall forbs and scattered shrubs for singing perches	May occur irregularly in non-native grasslands in the project area. One singing male was found in an annual grassland east of Lincoln; it was only present for a few days (April 1999). A fall migrant was found along Brewer Road (September 1999). (Easterla pers. comm.; Webb 2003.)
Tricolored blackbird <i>Agelaius tricolor</i>	BCC CSC (nesting colony)	Breeds near freshwater, preferably in emergent wetland with tall dense cattails or tules, but also in thickets of willow, blackberry, wild rose, and tall herbs. Feeds in grassland and cropland habitats. Found throughout the Central Valley and on the coast.	May forage in non-native grasslands and nest in some raw water storage facilities.
Lawrence’s goldfinch <i>Carduelis lawrencei</i>	BCC	Occurs in valley foothill hardwood and valley foothill hardwood-conifer. Breeds in open oak or other arid woodland and chaparral, near water.	May occur in woodland habitats in the project area.
Loggerhead shrike <i>Lanius ludovicianus</i>	– CSC (nesting)	Open habitats with sparse shrubs and trees (or other suitable perch sites) and bare ground and/or low, sparse herbaceous cover; oak woodlands for nesting. Found in lowlands and foothills throughout California	May forage in non-native grasslands and nest in woodland habitats in the project area.
Mammals			
Spotted bat <i>Enderma maculatum</i>	– CSC	Habitats range from arid deserts and grasslands through mixed conifer forests up to 10,600 feet in southern California. Prefers sites with adequate roosting habitat, such as cliffs. Often limited by the availability of cliff habitat. Feeds over water and along marshes.	May roost or forage in the project area in all habitat types, but project area outside of species’ historic range.

Name	Status	Habitat	Potential Occurrence
Greater western mastiff bat <i>Eumops perotis californicus</i>	– CSC	Occurs in many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, annual and perennial grasslands, chaparral, desert scrub, and urban areas in southeastern San Joaquin Valley and Coastal Ranges from Monterey County south. Typically roosts in caves, crevices or other rock formations. Requires open areas for foraging.	Unlikely to occur. Project area is outside of species' known distribution.
Townsend's big-eared bat <i>Corynorhinus townsendii</i>	– CSC	Occurs from low desert to mid-elevation montane habitat. Occurs in rural settings, inland deserts, coastal redwoods, oak woodland of the inner Coast Range and Sierra, and low to mid-elevation mixed forest.	May roost or forage in the project area in all habitat types, but project area outside of species' historic range.
Status Codes			
Federal FE = Federally listed as Endangered FT = Federally listed as Threatened = Federal Species of Concern FC = Federal Candidate species FPT = Federally Proposed Threatened BCC = Birds of Conservation Concern	State CE = California listed as Endangered CT = California listed as Threatened CR = California listed as Rare CSC = California Species of Concern CFP = California Fully Protected		

Status and habitat information is taken from California Natural Diversity Database (CDFG 2004), Zeiner et al. (1990), and USFWS Official Species List

¹ Based on table presented in the Lincoln Area Water Treatment Plant Planning and Site Study (NID 2005). Updated by Robertson-Bryan, Inc. for internal use only by NID (August 2009).

Historic and Tribal/Cultural Resources

NID has a variety of historic, tribal, and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan. Domestic water service with the District's service area boundary in the North Auburn area has increased by roughly 40 connections in the last 5 years. Irrigation water service has increase by 180 customers in the 5 year window. A majority of future residential developments within Placer County will occur outside the District's service area boundary.

Development since 2016

In March 2021, the District completed the Combie Phase 1, the main water supply artery into Placer County. In addition, the District has expanded its domestic water supply distribution system into the Placer County

Government Center to support future water needs. The District has annexed 11 parcels in its internal boundary who are eligible to receive irrigation water as feasible.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. The District relies on the city and county planning departments to establish future growth areas. The Districts reviews each growth or building project to assess water supply availability and determine the amount of water needed during drought. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

J.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table J-3 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Agriculture Pests and Disease

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

The Nevada Irrigation District (NID) is preparing its 2020 Agricultural Water Management Plan (AWMP) and 2020 Urban Water Management Plan (UWMP) due to the State of California, Department of Water Resources in 2021. Because NID is both a municipal drinking water supplier and an agricultural raw water supplier it submits both documents to the State Department of Water Resources (DWR) every five years. These plans contain pertinent information regarding agriculture and water supply and will be available on the NID website after they are finalized at <https://www.nidwater.com/ag-urban-water-management-plans>.

The NID service area covers the Sierra Nevada foothills, which is very different than agricultural areas in the Sacramento and San Joaquin Valleys. The service area topography contains many sloped areas with rock outcroppings, as well as less sloped areas better suited for pasture, orchards, and row crops. The foothill area contains numerous fractured rock systems that allow for private wells, but also complicate the ability to understand and quantify percolation and subsurface systems. Soil types, infiltration rates, and water holding capacities vary widely from a clay dominant soil type to a sandy, alluvial soil type in valley areas.

Summers are generally dry with mild to hot temperatures. Winters are relatively wet, especially in the upper elevations around Nevada City and Grass Valley, with snow levels usually around 3,500 ft and occasionally as low as 1,000 ft. Based on the historical data obtained from the California Irrigation Management Information System (CIMIS) and the Western Regional Climate Center (WRCC), the District's service area's average minimum and maximum monthly temperatures range from 26.4 to 92.5 degrees Fahrenheit.

Location and Extent

The gross acreage of the NID jurisdictional area is 287,000 acres which includes portions of Nevada, Placer and Yuba counties, of which approximately 32,000 acres is irrigated agriculture. These areas are typically in the lower elevation of the District, in the Sierra Nevada Foothills. About ninety percent of all the water delivered by NID is for agricultural use in Nevada and Placer Counties. Most agricultural water customers purchase water seasonally, from mid-April through mid-October. Over the past five years, the District averaged approximately 20 new agricultural customers per year. The District delivers approximately 110,000 Acre Feet of irrigation water annually.

There are multiple crops within the District's service area that vary due to topographical, geological, climatic, and soil condition differences. NID surveys its agriculture customers annually to inventory the type and approximate acreage of crops cultivated by their customers. NID checks the reported value against past reports, but does not verify and validate every report. The customer-provided crop data is in NID's 2020 AWMP Public Draft Crop Reports. Information from the reports is provided to the California State Water Resources Control Board with the District's annual water rights filings. Of the 32,000 acres of irrigated lands, approximately 20,000 acres are irrigated pasture, and family farms, forage, fruit crops and nuts comprise the majority of the remaining acres. Each crop type has a different consumptive use rate, and crops that are more temperature sensitive and vulnerable to climate change will likely require additional irrigation or an extended irrigation season.

NID's water management facilities include storage, treatment, and conveyance facilities. The District operates and maintains nine reservoirs with a combined storage total of 280,085 acre-feet (AF). The two major distribution and storage systems within the District are the Deer Creek System and the Bear River System. These systems are a mixture of canals, siphons, pipelines, and other water conveyance structures. The system is supplied by diverting NID's surface water rights into the canals at either reservoirs or at other diversion facilities located on the streams. Typical canal operations divert enough flow to allow the purchased deliveries to each customer on the canal. To maintain proper flow rates through customer delivery points, the water surface in the canal is maintained at certain levels, as is typical for miner's inch delivery systems. However, this also results in water exiting the canal at the downstream terminus. Many of these spills are then captured again at the next downstream diversion point for another canal.

Past Occurrences

There are no current state or federal disasters in Placer County related to agriculture, however planning scenarios should include a worst case event as impacts associated with climate change and elevated drought risks can trigger disease and pest outbreaks. Although outside of the NID irrigation district area, there are current threats and agricultural concerns that managers and farmers are responding to. For instance, as of July 2017, 200 square miles in south Placer County are under a citrus quarantine after the discovery of the psyllids in western Lincoln in September 2016, and single psyllid in Roseville in June 2017. The found psyllids did not test positive for the disease, but as a precautionary measure a quarantine has been put into effect for Lincoln, a significant portion of Roseville and portions of Rocklin and Granite Bay. (<https://www.placer.ca.gov/1554/Mandarin-Threat>).

Vulnerability to and Impacts from Agriculture Pests and Disease

According to the USDA, every year natural disasters, such as droughts, extreme heat and cold, floods, fires, hail, landslides, and tornadoes, challenge agricultural production. Because agriculture relies on the weather, climate, and water availability to thrive, it is easily impacted by natural events and disasters. Agricultural impacts from natural events and disasters most commonly include contamination of water bodies, loss of harvest or livestock, increased susceptibility to disease, and destruction of irrigation systems and other agricultural infrastructure. These impacts can have long lasting effects on agricultural production including crops, forest growth, and arable lands, which require time to mature. More specific impacts by hazard were listed in Section 4.3.6 of the Base Plan.

In addition to threats to agriculture from weather and other natural hazard events, agriculture in the County is at risk from insects, pests, and noxious weeds. Establishment of an invasive species would be detrimental to the agricultural industry of Placer County because of product losses, stringent quarantine regulations, loss of exporting opportunities and increased treatment costs. The introduction of exotic plants influences wildlife by displacing forage species, modifying habitat structure—such as changing grassland to a forb-dominated community—or changing species interactions within the ecosystem.

In addition, invasive weeds can increase fire risk in the County.

Assets at Risk

NID does not own agricultural lands, however it does provide water for irrigation in Placer County. Due to the potential for widespread impacts, specific agricultural hazards associated with climate and water availability may have significant impacts that are widespread in the region. The potential for these impacts is correlated with climate change and local climate factors, as well as natural cycles of disease and pests. According to Placer County data, approximately 11% of employment is attributed to agriculture in Placer County, with significant growth in small farms and the “farm to fork” operations.

The potential for damages and interruptions within this water system are associated with the terrain that the canals and reservoirs flow through and associated potential for drought, wildfire, landslides, flooding, hazardous trees and anthropogenic disturbance. The District’s water supplies are very vulnerable to drought and are expected to be further impacted by climate change. The supply system relies on spring and summer snow melt runoff, as well as capture and storage in reservoirs to release during the irrigation season. During droughts and periods of warmer winters when there is less snowpack, runoff is reduced, and the District must manage its storage and customer demands to meet requirements. The most prominent and obvious cause for the fluctuation in natural runoff is the variability in hydrologic conditions, as seen in the wide variations in annual rainfall/snowpack accumulations. The supply availability reduction is dependent on the severity and length of the drought. In addition to the hydrologic impacts on NID’s supplies, there can also be regulatory reduction as well, as during the last drought the State mandated supply curtailments and NID was not able to access its available supply.

Avalanche

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to the Sierra Avalanche Center, avalanches occur when loading of new snow increases stress at a rate faster than strength develops, and the slope fails. Avalanches are a rapid down-slope movement of snow, ice and debris triggered by ground shaking, sound, or human or animal movement. Avalanches consist of a starting zone where the ice or snow breaks loose, a track which is the grade or channel the debris slides down and a run-out zone where the snow is deposited.

Critical stresses develop more quickly on steeper slopes and where deposition of wind-transported snow is common. The vast majority of avalanches occur during and shortly after storms. This hazard generally affects a small number of people, such as snowboarders, skiers, and hikers who venture into backcountry areas during or after winter storms. Road and highway closures, damaged structures and critical infrastructure, and destruction of forests are also a direct result of avalanches.

Location and Extent

The two primary factors impacting avalanche activity are weather and terrain. Large, frequent storms deposit snow on steep slopes to create avalanche hazards. Additional factors that contribute to slope stability are the amount of snow, rate of accumulation, moisture content, wind speed and direction and type

of snow crystals. Topography also plays a vital role in avalanche dynamics. Slope angles between 30 to 45 degrees are optimal for avalanches. The risk of avalanches decreases on slope angles below 30 degrees. At 50 or more degrees they tend to produce sluff or loose snow avalanches that account for only a small percentage of avalanche deaths and property damage annually.

Areas prone to avalanche hazards include hard to access areas deep in the backcountry and those in the more developed higher elevations of the County in the Tahoe basin. Avalanche hazards exist in eastern Placer County where combinations of the above criteria occur.

Past Occurrences

There have been no state or federal disasters in the County related to avalanche. Heavy snow in the early 1990's blocked water flow in the South Yuba Canal and created constraints on the Districts water delivery system. Emergency pumps were brought in to pump water from Scotts Flat as a backup while the snow was cleared.

Vulnerability to and Impacts from Avalanche

Avalanches occur when the weight of new snow increases stress faster than strength of the snowpack develops, causing the slope to fail. Avalanche conditions develop more quickly on steeper slopes (located in the eastern portions of the County) and where wind-blown snow is common. Avalanche impacts vary, but include risk to property, injury, or death. Avalanches generally affect a few snowboarders, skiers, and hikers who venture into backcountry areas during or after winter storms. Avalanches cause road closures, and can damage structures and forests.

NID has critical water supply facilities in the high alpine watershed that supply a majority of the District's annual water needs. These facilities are located in remote, steep terrain that is subject to avalanche during heavy winters. The primary danger with an avalanche is the potential for blockage of canals and damage to the many elevated flumes relied upon for conveyance.

Heavy snow in the early 1990's blocked water flow in the South Yuba Canal and created constraints on the Districts water delivery system. Emergency pumps were brought in to pump water from Scotts Flat as a backup while the snow was cleared. The District has completed a permanent pumping facility as an emergency backup supply should future heavy snows or avalanches damage District facilities on the Nevada County branch. Most of the water supply facilities are shared between the District and PG&E. Both agencies would coordinate to facilitate necessary repairs.

Assets at Risk

An avalanche that cuts water supply from Spaulding Reservoir has the potential to affect domestic and irrigation water supplies, powerhouse generation, and have a negative effect on recreation at the local reservoirs

Climate Change

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Climate change adaptation is a key priority of the State of California. The 2018 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state’s infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Climate models predict that the Sierra Nevada Region will experience warming average annual temperatures ranging from an increase of 2°F - 4°F in the winter and 4°F - 8°F in the summer by the end of the century. This shift to a warmer climate is expected to have wide ranging effects on the annual weather conditions, snowfall, forest health, water availability, and wildfire. One of the most concerning impacts of climate change on the District is reduced forest resilience and the projected decrease in annual snowpack accumulation due to the transition of average annual precipitation from snow to rain caused by increasing temperatures. As a headwaters region, snowpack is the largest source of storage within the NID system, and the series of reservoirs rely heavily on the timed release of water in snowpack to recharge reservoirs into the late summer when rain no longer falls. Actively managing forested landscapes can help NID address climate change impacts, prepare for the future, and reduce risks (such as wildfire ignition) that are exacerbated by a warmer climate.

Location and Extent

Climate change is a global phenomenon. It is expected to affect the whole of the District, Placer County, and State of California. There is no scale to measure the extent of climate change. Climate change exacerbates other hazards, such as drought, extreme heat, flooding, wildfire, and others. The speed of onset of climate change is very slow. The duration of climate change is not yet known, but is feared to be tens to hundreds of years.

The effects of climate change are variable across the whole of the District service area. Increasing average temperatures and a shift in winter precipitation from snow to rain will have immediate effects on the function of NID’s water collection system; especially in the upper elevation snowpack. Lower elevations may see more variability in weather conditions, drought, and severe storm events which are a risk to operation and maintenance of the water system due to the unpredictability and potential to damage infrastructure.

Wildfire is one hazard that is significantly influenced by increased average temperature, drought, and excessive tree mortality impacts of climate change. All elevations of the District have the potential for severe damages in the event of a catastrophic wildfire.

Past Occurrences

Climate change has never been directly linked to any declared disasters. While the District noted that climate change is of concern, no specific impacts of climate change could be recalled. The District and HMPC members did, however, note that in Placer County, the strength of storms does seem to be increasing and the temperatures seem to be getting hotter. Hotter temperatures, combined with recent drought conditions, exacerbates the potential for damaging wildfires.

The District noted that due to the long-term nature of climate change, no one disaster can be directly attributed to climate change alone. Climate change has exacerbated many Nevada County disasters by increasing the frequency of hazardous weather conditions, decreasing snowpack, increasing the likelihood of flood, and intensifying wildfire.

Vulnerability to and Impacts from Climate Change

The California Adaptation Planning Guide (APG) prepared by California OES and CNRA was developed to provide guidance and support for local governments and regional collaboratives to address the unavoidable consequences of climate change. California's APG: Understanding Regional Characteristics has divided California into 11 different regions based on political boundaries, projected climate impacts, existing environmental setting, socioeconomic factors and regional designations. Placer County falls within the North Sierra Region characterized as a sparsely settled mountainous region where the region's economy is primarily tourism-based. The region is rich in natural resources, biodiversity, and is the source for the majority of water used by the state. This information can be used to guide climate adaptation planning in the District and Placer County Planning Area.

The California APG: Understanding Regional Characteristics identified the following impacts specific to the North Sierra region in which the Placer County Planning Area is part of:

- Temperature increases
- Decreased precipitation
- Reduced snowpack
- Reduced tourism
- Ecosystem change
- Sensitive species stress
- Increased wildfire

The direct impacts of climate change on District facilities, water conveyance system, or and operations are broad. Drought can impact stream flow, water supply, and lead to conflicts between environmental and anthropogenic uses. Increased wildfire potential, and increased burn severity can destroy infrastructure as well as have long-lasting impacts to the watersheds NID collects water resources from. Increased flows due to excessive or above average runoff can impact infrastructure designed for a historic flow regime by over topping

Assets at Risk

All District assets which are impacted by wildfire, decreased water supply, decreased snowpack, increased runoff, or excessive tree mortality and hazard trees are at risk.

Dam Failure

Likelihood of Future Occurrence—Occasional

Vulnerability—High

Hazard Profile and Problem Description

Dams are manmade structures built for a variety of uses including flood protection, power generation, agriculture, water supply, and recreation. When dams are constructed for flood protection, they are usually engineered to withstand a flood with a computed risk of occurrence. For example, a dam may be designed to contain a flood at a location on a stream that has a certain probability of occurring in any one year. If prolonged periods of rainfall and flooding occur that exceed the design requirements, that structure may be overtopped or fail. Overtopping is the primary cause of earthen dam failure in the United States.

Location and Extent

Dam failure is a natural disaster from two perspectives. First, the inundation from released waters resulting from dam failure is related to naturally occurring floodwaters. Second, a total dam failure would most probably happen as a consequence of the natural disaster triggering the event, such as flooding or an earthquake. There is no scale with which to measure dam failure. However, Cal DWR Division of Safety of Dams (DOSD) assigns hazard ratings to dams within the State that provides information on the potential impact should a dam fail. The following two factors are considered when assigning hazard ratings: existing land use and land use controls (zoning) downstream of the dam. Dams are classified in four categories that identify the potential hazard to life and property: Low, Significant, High, and Extremely High. These were discussed in more detail in Section 4.3.9 of the Base Plan.

While a dam may fill slowly with runoff from winter storms, a dam break has a very quick speed of onset. The duration of dam failure is generally not long – only as long as it takes to empty the reservoir of water the dam held back. The District would be affected for as long as the flood waters from the dam failure took to drain downstream.

Dams inside the County that can affect the District can be seen on Figure J-2. Dams outside the County that can affect the District can be seen on Figure J-3.

Figure J-2 NID – Dam Inundation Areas from Dams Inside the County

0 5 10 Miles

COUNTY OF
Placer

Data Source: DWR DSOD Data 2020, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Past Occurrences

There has been no federal or state disaster declarations for dam failure in the County. The District noted no other dam failure occurrences that have affected the District.

Vulnerability to and Impacts from Dam Failure

Dam failure flooding would vary by community depending on which dam fails and the nature and extent of the dam failure and associated flooding. Impacts to the District from a dam failure flood could include loss of life and injury, flooding and damage to property and structures, damage to critical facilities and infrastructure, loss of natural resources, and all other flood related impacts. Additionally, mass evacuations and associated economic losses can also be significant.

NID owns several dams of concern. The District's highest dam is the rock fill-earth core dam at Rollins Reservoir, built in 1965 and standing 242 feet tall. The Jackson Meadows dam (1965) is second highest at 195 feet, Bowman North Rockfill Dam is 178 feet, Scotts Flat dam (1965) is 175 feet, and the Bowman South Arch dam (1925) is 171 feet high.

French Dam, constructed in 1858-59, is the District's oldest dam still in use. Other dams that originated in the 1800s include the Bowman Rockfill dam (1872), and Faucherie, Sawmill and Jackson, all constructed prior to 1880 and have since been entirely torn down and rebuilt at different times. In the lower division, Van Giesen Dam at Combie Reservoir is the oldest, built in 1928. Additional information related to NID's dams can be found on its website at: <https://www.nidwater.com/dam-safety>.

Vulnerability to dam failures is generally confined to the areas subject to inundation downstream of the facility. Based on analysis provided in the Placer County General Plan Background Report, only five dams within Placer County have the potential to affect more than 100 persons: Folsom Dikes No. 5 & 6; Lake Tahoe Dam; Camp Far West Dam; Lake Combie Dam; and Rollins Reservoir Dam. Of these five, a failure of Rollins Reservoir or Combie Dams could potentially impact areas within the NID. Failure of Dutch Flat Forebay or Afterbay could also potentially impact services provided by NID, albeit in a limited capacity.

Assets at Risk

All District assets are at risk in the event of dam failure due to the loss of water in the overall system.

Drought & Water Shortage

Likelihood of Future Occurrence—Occasional

Vulnerability—High

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area's usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and

economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages, or it can last for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table J-7.

Table J-7 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan. Specific past occurrences for the District include:

A severe drought that affected the District and all of California is the drought of **1977-1978**. This drought was severe enough to trigger implementation of the District’s Drought Contingency Plan at the most restrictive level – that of mandatory rationing and reduction in service to irrigation customers up to 50%.

The 1991-1992, drought also severely impacted the District and other areas of Placer County and surrounding California foothills.

After 2 years of below-average rainfall and very low snow-melt run off, Governor Schwarzenegger in June of 2008 declared a state of emergency for drought conditions statewide. The final California Department of Water Resources showed snowpack water content at only 67 percent of normal.

The District experienced below average precipitation and minimal snowpack from 2012 to 2015 and again from 2017 to 2020. Current precipitation conditions are below average as well. In 2014 the District recorded a snowpack reading of 5% of average, the lowest snowpack reading since it began collecting this data in 1921. Governor Brown declared a state of emergency and the State Water Resources Control Board restricted water use and curtailed many of the Districts water rights. The limited water supply along with the States mandated actions necessitated the enactment of the Districts Drought Contingency Plan. Mandatory reductions of 36% were required for all treated water customers, while ag water customers provided voluntary cutbacks. Throughout the drought, the District proactively managed its water resources during the dry years through conservation and careful water management. The District also purchased supplemental waters from neighboring agencies to help bolster supply.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. However, climate change impacts are trending towards more variable weather events, and therefore, unpredictability of drought. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

With the unknowns of drought and globally changing climate conditions, NID, more than ever, is promoting water conservation and expansion of storage.

Continued prolonged drought would be detrimental to the District's finances. As people are asked to conserve, water use reduced, resulting in decreased revenue. Additionally, during drought, the District purchases supplemental water supplies to bolster reservoir storage. The expense of purchasing water can eclipse 2.5 million dollars.

Assets at Risk

The main asset at risk during drought is the financial health of the District. The loss of water sales in combination with additional water purchases expenses is detrimental to the District's funds. In addition, District hydroelectric powerhouses would be shut down due to limited natural flows, thus providing another hit to District finance via loss of power generation.

Earthquake

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

An earthquake is caused by a sudden slip on a fault. Stresses in the earth's outer layer push the sides of the fault together. Stress builds up, and the rocks slip suddenly, releasing energy in waves that travel through the earth's crust and cause the shaking that is felt during an earthquake. Earthquakes can cause structural damage, injury, and loss of life, as well as damage to infrastructure networks, such as water, power, gas, communication, and transportation. Earthquakes may also cause collateral emergencies including dam and levee failures, seiches, hazmat incidents, fires, avalanches, and landslides. The degree of damage depends on many interrelated factors. Among these are: the magnitude, focal depth, distance from the causative fault, source mechanism, duration of shaking, high rock accelerations, type of surface deposits or bedrock, degree of consolidation of surface deposits, presence of high groundwater, topography, and the design, type, and quality of building construction.

Location and Extent

The amount of energy released during an earthquake is usually expressed as a magnitude and is measured directly from the earthquake as recorded on seismographs. An earthquake's magnitude is expressed in whole numbers and decimals (e.g., 6.8). Seismologists have developed several magnitude scales, as discussed in Section 4.3.11 of the Base Plan. Placer County itself is traversed by a series of northwest-trending faults, called the Foothill Fault Zone, that are related to the Sierra Nevada uplift. This was the source of Oroville's 1975 earthquake (and an earlier event in the 1940s). Subsequent research of these events led to the identification and naming of the zone and questions about the siting and design of the proposed Auburn Dam. Earthquakes on nearby fault segments in the zone could be the source of ground shaking in the Placer County Planning Area.

Although portions of western and eastern Placer County are located in a seismically active region, no known faults actually go through any of the cities or towns. However, the Bear Mountain and the Melones faults are situated approximately three to four miles west and east of the City of Auburn respectively. Earthquakes on these two faults would have the greatest potential for damaging buildings in Auburn, especially the unreinforced masonry structures in the older part of the city and homes built before 1960 without adequate anchorage of framing and foundations. Similar lower magnitude but nearby earthquakes are capable of producing comparable damages in other Placer County communities.

Another measure of earthquake severity is intensity. Intensity is an expression of the amount of shaking at any given location on the ground surface. Seismic shaking is typically the greatest cause of losses to structures during earthquakes. Seismic shaking maps for the area show Placer County and the District fall within a low to moderate shake risk.

Past Occurrences

There have been no past federal or state disaster declarations from this hazard. The District noted no past occurrences of earthquakes or that affected the District in any meaningful way.

Vulnerability to and Impacts from Earthquake

The combination of plate tectonics and associated California coastal mountain range building geology generates earthquake as a result of the periodic release of tectonic stresses. Placer County lies in the center of the North American and Pacific tectonic plate activity. There have been earthquakes as a result of this activity in the historic past, and there will continue to be earthquakes in the future of the California north coastal mountain region.

Fault ruptures itself contributes very little to damage unless the structure or system element crosses the active fault; however, liquefaction can occur further from the source of the earthquake. In general, newer construction is more earthquake resistant than older construction due to enforcement of improved building codes. Manufactured buildings can be very susceptible to damage because their foundation systems are rarely braced for earthquake motions. Locally generated earthquake motions and associated liquefaction, even from very moderate events, tend to be more damaging to smaller buildings, especially those constructed of unreinforced masonry (URM) and soft story buildings.

The Uniform Building Code (UBC) identifies four seismic zones in the United States. The zones are numbered one through four, with Zone 4 representing the highest level of seismic hazard. The UBC establishes more stringent construction standards for areas within Zones 3 and 4. All of California lies within either Zone 3 or Zone 4. The NID is within the less hazardous Zone 3.

Impacts from earthquake in the District will vary depending on the fault that the earthquake occurs on, the depth of the earthquake strike, and the intensity of shaking. Large events could cause damages to infrastructure, critical facilities, residential and commercial properties, and possible injuries or loss of life.

Earthquake vulnerability for the District lies in the water delivery infrastructure and not in its buildings. Earthquakes can cause a separation of underground water supply mains causing flooding and ultimately leading to water supply interruptions.

Earthquakes also have the potential to cause failures of the canal berm/leave system and cause flooding and supply water interruptions.

Additionally, the District is responsible for multiple water storage dams that are susceptible to damage and potentially major flooding during a large earthquake event. The District's Dam facilities are under the jurisdiction of the CA Department of Dam Safety and the Federal Energy Regulatory Commission which require adherence to a strict set of safety guidelines and Dam safety protocol.

Assets at Risk

A strong earthquake has the potential to cause damage to nearly all District facilities.

Flood: 1%/0.2% Annual Chance

Likelihood of Future Occurrence–Occasional/Unlikely

Vulnerability–High

Hazard Profile and Problem Description

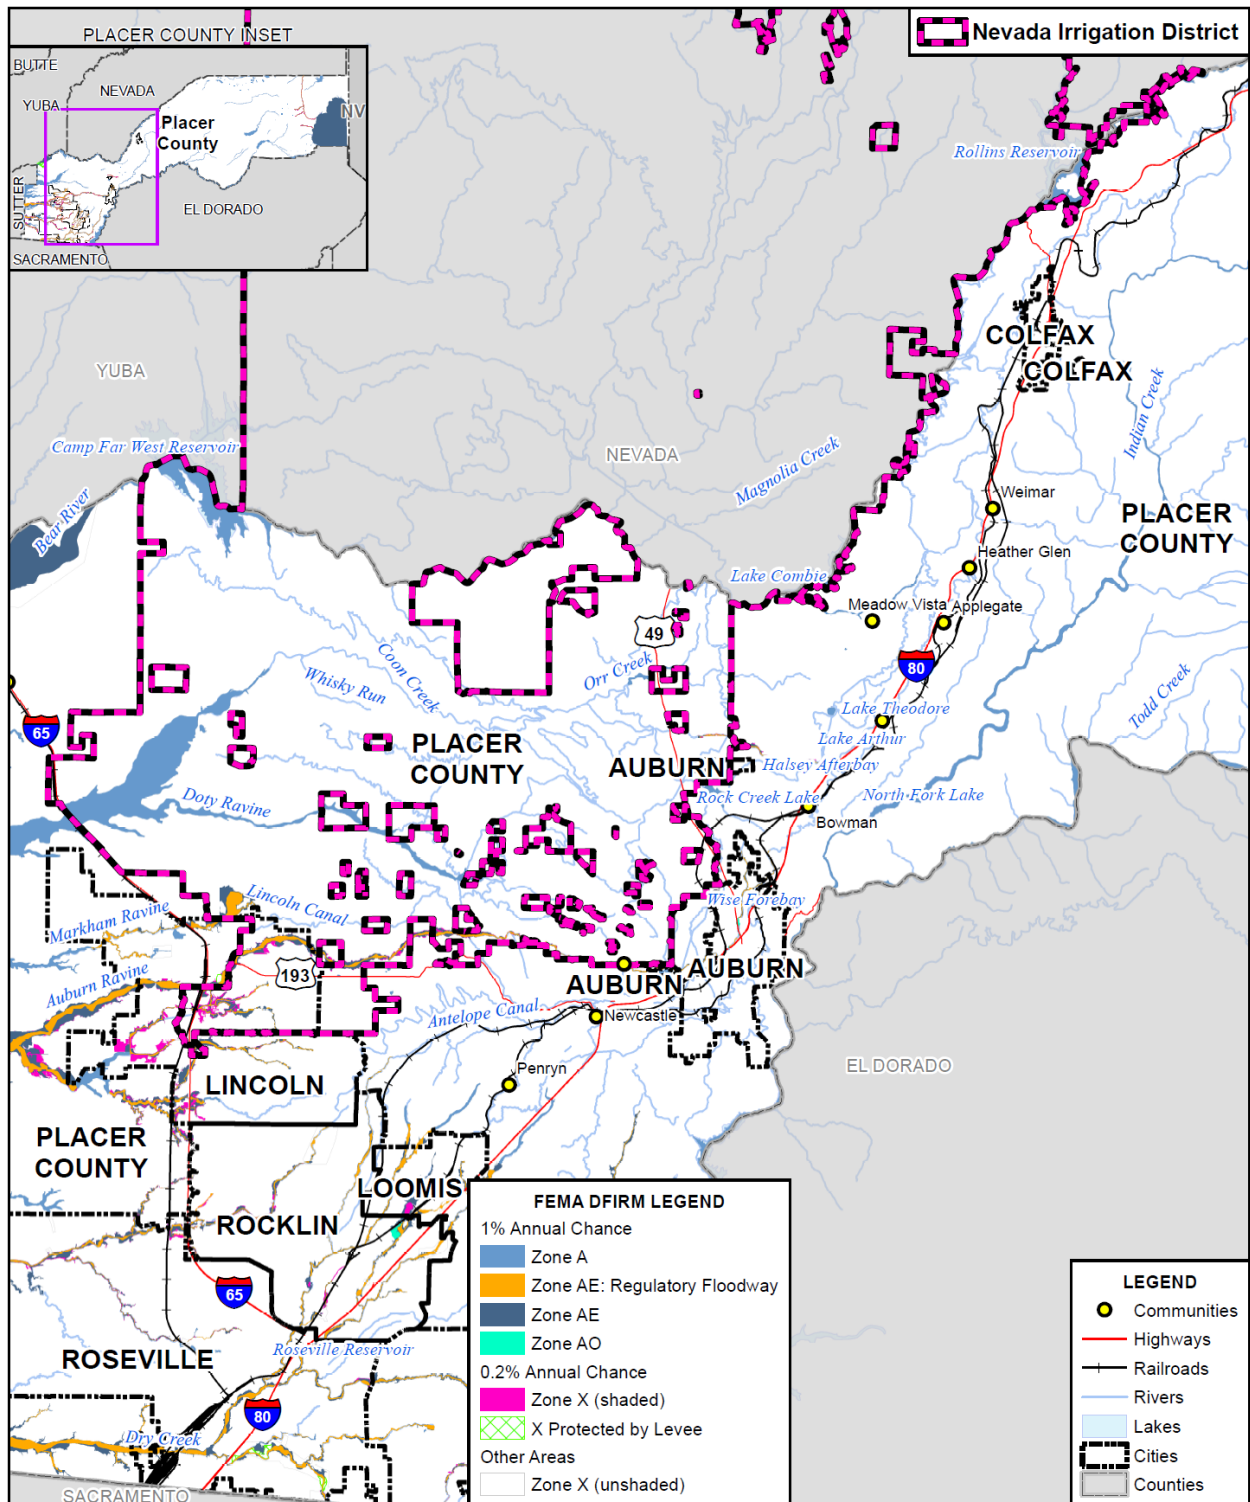

This hazard analyzes the FEMA DFIRM 1% and 0.2% annual chance floods. These tend to be the larger floods that can occur in the County or in the District, and have caused damages in the past. Flooding is a significant problem in Placer County and the District. Historically, the District has been at risk to flooding primarily during the winter and spring months when river systems in the County swell with heavy rainfall and snowmelt runoff. Normally, storm floodwaters are kept within defined limits by a variety of storm drainage and flood control measures. Occasionally, extended heavy rains result in floodwaters that exceed normal high-water boundaries and cause damage.

As previously described in Section 4.3.12 of the Base Plan, the Placer County Planning Area and the NID have been subject to historical flooding.

Location and Extent

The NID has areas located in the 1% and 0.2% annual chance floodplain. This is seen in Figure J-4.

Figure J-4 NID – FEMA DFIRM Flood Zones

FOSTER MORRISON

0 5 10 Miles

COUNTY OF
Placer

Data Source: FEMA DFIRM 11/2/2018, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Table J-8 details the DFIRM mapped flood zones within the 1% annual chance flood zone as well as other flood zones located within the District.

Table J-8 NID– DFIRM Flood Hazard Zones

Flood Zone	Description	Flood Zone Present in the District
A	Areas subject to inundation by the 1% annual-chance flood event generally determined using approximate methodologies. Because detailed hydraulic analyses have not been performed, no Base Flood Elevations (BFEs) or flood depths are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE – Regulatory Floodway	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply. Different from AE in that it adds the water course and adjacent lands that must be reserved in order to discharge the base flood without increasing the water surface elevation by more than one foot.	
AH	An area inundated by 1% annual chance flooding (usually an area of ponding), for which BFEs have been determined; flood depths range from 1 to 3 feet	
AO	Areas subject to inundation by 100-year shallow flooding (usually sheet flow on sloping terrain) where average depths are between one and three feet	
Shaded X	500-year flood the areas between the limits of the 1% annual chance flood and the 0.2-percent-annual-chance (or 500-year) flood	X
X Protected by Levee	An area determined to be outside the 500-year flood and protected by levee from 100-year flood	
X	Areas outside of known floodplains.	X

Source: FEMA

Additionally, flood extents can generally be measured in volume, velocity, and depths of flooding. Expected flood depths in the District vary, depending on the nature and extent of a flood event; specific depths are unknown. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Flooding in the District tends to have a shorter speed of onset, due to the amount of water that flows through the District.

Past Occurrences

A list of state and federal disaster declarations for Placer County from flooding is shown on Table J-9. These events also likely affected the District to some degree.

Table J-9 Placer County – State and Federal Disaster Declarations from Flood 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Flood (including heavy rains and storms)	16	1950, 1955, 1958 (twice), 1962, 1963, 1969, 1973, 1980, 1983, 1986, 1995 (twice), 1997, 2008, 2017	13	1955, 1958, 1962, 1964, 1969, 1983, 1986, 1995 (twice), 1997, 2006 (twice), 2017

Source: Cal OES, FEMA

Heavy prolonged precipitation in late 1996 caused flood damage across much of the District’s service area. President Clinton proclaimed the area a disaster area while Governor Wilson followed suit. Many of the District’s main diversion dams and canals were washed out. Over 50 applications for flood damage assistance for the repair of NID facilities were submitted to FEMA and Cal OES.

Another flood event to impact the District is the late December floods of 2005. Excessive rain for a prolonged period caused severe flooding in the Sierra foothills, in and around Placer County. Impacts included damage to the District’s canal system as well as damage to roads and properties throughout District boundaries.

Vulnerability to and Impacts from Flood

Floods have been a part of the District’s historical past and will continue to be so in the future. During winter months, long periods of precipitation and the timing of that precipitation are critical in determining the threat of flood, and these characteristics further dictate the potential for widespread structural and property damages. Predominantly, the effects of flooding are generally confined to areas near the waterways of the County. As waterways grow in size from local drainages, so grows the threat of flood and dimensions of the threat. This threatens structures in the floodplain. Structures can also be damaged from trees falling as a result of water-saturated soils. Electrical power outages happen, and the interruption of power causes major problems. Loss of power is usually a precursor to closure of governmental offices and community businesses. Roads can be damaged and closed, causing safety and evacuation issues. People may be swept away in floodwaters, causing injuries or deaths.

Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits. Direct impacts, such as drowning, can be limited with adequate warning and public education about what to do during floods. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, loss of environmental resources, and economic impacts.

Flooding and soil erosion due to heavy rains and snow runoff have been a historical problem throughout Placer County. Abundant snowfall in the mountains combined with rain and steep terrain can mean rapid runoff and flooding. Water flow can be high in peak runoff periods with historical downstream flooding. The primary impacts from flooding within the District include damage to roads, utilities, bridges; and flooding of homes, businesses and critical facilities. Flooding has also caused canals to overtop and erosion of the canal levees.

Assets at Risk

All District assets are potentially at low risk of this hazard.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence—Highly Likely

Vulnerability—Medium

Hazard Profile and Problem Description

Flooding occurs in areas other than the FEMA mapped 1% and 0.2% annual chance floodplains. Flooding may be from drainages not studied by FEMA, lack of or inadequate drainage infrastructure, or inadequate maintenance. Localized, stormwater flooding occurs throughout the County during the rainy season from November through April. Prolonged heavy rainfall contributes to a large volume of runoff resulting in high peak flows of moderate duration.

Location and Extent

The NID is subject to localized flooding throughout the District. The Districts treated water system is susceptible to localized flooding damages from concentrated storm water runoff causing erosion of soil and exposing the water main. The exposed water main is then weekend and vulnerable to breakage due to the loss of securing soils. Treated water pipelines also have the potential to cause localized flooding during water main breaks. The District's canal systems are subject inundation and overtopping during a localized flood event. The overtopping can lead to property damages.

Flood extents are usually measured in areas affected, velocity of flooding, and depths of flooding. Expected flood depths in the District vary by location. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Localized flooding in the District tends to have a shorter speed of onset, especially when antecedent rainfall has soaked the ground and reduced its capacity to absorb additional moisture.

Past Occurrences

There have been no federal or state disaster declarations in the County due to localized flooding. Past flooding incidents, although minor in scope, have occurred on nearly every District canal. Occasionally the District will receive a claim for localized flooding of property due to an overtop in a canal from heavy rains. The District experiences on average ten to twenty of these types of claims annually.

Vulnerability to and Impacts from Localized Flooding

Historically, much of the growth in the District and County has occurred adjacent to streams, resulting in significant damages to property, and losses from disruption of community activities when the streams overflow. Additional development in the watersheds of these streams affects both the frequency and duration of damaging floods through an increase in stormwater runoff.

Primary concerns associated with stormwater flooding include life safety issues, and impacts to property and to infrastructure that provides a means of ingress and egress throughout the community. Ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Objects can also be buried or destroyed through sediment deposition. Floodwaters can break utility lines and interrupt services. Standing water can cause damage to crops, roads, and foundations. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

NID supplies both drinking and irrigation water to portions of Placer County. The conveyance of water is accomplished through over 400 miles of pipe and nearly 500 miles of open canal. Both the water pipelines and canal facilities are subject to damages from localized flooding.

The District's treated water system is susceptible to localized flooding damages from concentrated storm water runoff causing erosion of soil and exposing the water main. The exposed water main is then weekend and vulnerable to breakage due to the loss of securing soils. Treated water pipelines also have the potential to cause localized flooding during water main breaks.

The District performs ongoing canal rehabilitation to fortify facilities to bolster against storm water infiltration. In addition, the District has finished the replacement of the Combie Ophir 1 canal, a major water delivery system to Placer County.

Assets at Risk

The Districts canal water systems as well as the domestic water supply systems are assets that are most vulnerable to localized flooding.

Landslide, Mudslide, Debris Flows

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

According to the California Geological Survey, landslides refer to a wide variety of processes that result in the perceptible downward and outward movement of soil, rock, and vegetation under gravitational influence. Common names for landslide types include slump, rockslide, debris slide, lateral spreading, debris avalanche, earth flow, and soil creep. Landslides may be triggered by both natural and human-induced changes in the environment that result in slope instability.

The susceptibility of an area to landslides depends on many variables including steepness of slope, type of slope material, structure and physical properties of materials, water content, amount of vegetation, and proximity to areas undergoing rapid erosion or changes caused by human activities. These activities include mining, construction, and changes to surface drainage areas. Landslide events can be determined by the composition of materials and the speed of movement. A rockfall is dry and fast while a debris flow is wet and fast. Regardless of the speed of the slide, the materials within the slide, or the amount of water present in the movement, landslides are a serious natural hazard.

Debris flows, can also occur in some areas of the County and the District. These debris flows generally occur in the immediate vicinity of existing drainage swales or steep ravines. Debris flows occur when near surface soil in or near steeply sloping drainage swales becomes saturated during unusually heavy precipitation and begins to flow downslope at a rapid rate. Debris flows are also common during the rainy season in post fire areas.

Landslides have the potential to displace or cutoff water supply canals and distribution lines supplying District customers.

Location and Extent

Landslides, mudslides, and debris flows can affect certain sloped areas of the District. The CGS has estimated that the risk varies across the District and has created maps showing risk variance. This risk variance falls into multiple categories. These are discussed in Section 4.3.14 of the Base Plan. According to the District Planning Team, risk varies within the District range from low to high. The speed of onset of landslide is often short, especially in post-wildfire burn scar areas, but it can also take years for a slope to fail. Landslide duration is usually short, though digging out and repairing landslide areas can take some time.

Past Occurrences

There have been no federal or state disaster declarations in the County from landslide. The District Planning Team noted the following past occurrences of landslides.

In 1980, NID experienced a major landslide that caused the Combie Phase 1 canal to wash down the mountain side and into the Bear River. In addition to the loss of water supply to much of Placer County, the mud and debris that flowed into the Bear River system necessitated a major environmental cleanup.

In 2011 the PG&E – Bear River Canal suffered a landslide that rendered the canal inoperable for over a month. The canal is one of the main water supply arteries for Placer County. Local water purveyors including NID and PCWA had to enact Water Shortage Contingency Planning and ration water supplies to Ag water customers until repairs were complete.

In 2017 A landslide destroyed an elevated flume section of the South Yuba Canal and interrupted water flows into Nevada County for four months. Alternate supplies and conservation became key to making it through the episode

Vulnerability to and Impacts from Landslide

Although landslides are primarily associated with slopes greater than 15 percent, they can also occur in relatively flat areas and as cut-and-fill failures, river bluff failures, lateral spreading landslides, collapse of wine-waste piles, failures associated with quarries, and open-pit mines. Landslides may be triggered by both natural- and human-caused activity.

Heavy rain events during the winter months tend to destabilize the soils on many of the steep hillsides that NID's Canals flow through. These destabilizations can cause minor landslides or debris flows that slide into or block NID canals. In addition to the blockage, the flows within the canal only exasperate the problem as the water backs up and overflows the berms thereby creating an even more destructive mud/ debris flow.

Impacts in the District may be to structures, infrastructure, and to life safety.

Assets at Risk

Localized flooding has the potential to affect the Districts canal systems, small reservoirs, treated water distribution system, and the North Auburn Water Treatment Plant.

Levee Failure

Likelihood of Future Occurrence–Unlikely

Vulnerability–Medium

Hazard Profile and Problem Description

A levee is a raised area that runs along the banks of a stream or canal. Levees reinforce the banks and help prevent flooding by containing higher flow events to the main stream channel. By confining the flow to a narrower stream channel, levees can also increase the speed of the water. Levees can be natural or man-made.

Levees provide strong flood protection, but they are not failsafe. Levees are designed to protect against a specific flood level and could be overtopped during severe weather events or dam failure. For example, levees can be certified to provide protection against the 1% annual chance flood. Levees reduce, not eliminate, the risk to individuals and structures located behind them. A levee system failure or overtopping can create severe flooding and high water velocities. Levee failure can occur through overtopping or from seepage issues resulting from burrowing rodents, general erosion, excessive vegetation and root systems and other factors that compromise the integrity of the levee. No levee provides protection from events for which it was not designed, and proper operation and maintenance are necessary to reduce the probability of failure.

A majority of the nearly 500 miles of NID canals are manmade and were designed with small levees to direct the flow of water. These canals levees are vulnerable to failure for a multitude of reasons including but not limited to, overtopping flows, rodent and varmint intrusion, vegetation weakening, etc.

Location and Extent

There is not a scientific scale or measurement system in place for levee failure. Expected flood depths from a levee failure in the District vary by event and location. The speed of onset is slow as the river rises, but if a levee fails the warning times are generally short for those in the inundation area. The duration of levee failure risk times can be hours to weeks, depending on the river flows that the levee holds back. When northern California dams and reservoirs are nearing maximum capacity, they release water through the river systems, causing additional burdens on County levees. While the District is not located in areas protected by levees constructed for flood control purposes and seen in the most recent FEMA DFIRMs, the District has over 400 miles of NID canals designed with small levees to direct the flow of water.

Past Occurrences

There have been no federal or state disaster declarations from levee failure. The last levee/canal berm failure occurred in 2012 and caused damage to multiple private properties. Small scale levee failures occur nearly every year during extreme thunderstorm type events. Most of the overtopping's or failures are minor in nature and can be fixed in short order through ongoing maintenance activities.

Vulnerability to and Impacts from Levee Failure

A levee failure can range from a small, uncontrolled release to a catastrophic failure. Levee failure flooding can occur as the result of prolonged rainfall and flooding. The primary danger associated with levee failure is the high velocity flooding of those properties outside and downstream of the breach. When a levee is breached, the flows contained within the canal escape and flood the surrounding private properties including private residences.

Should a levee fail, some or all of the area protected by the levees would be at risk to flooding. Impacts from a levee failure include property damage, critical facility damage, and life safety issues. Business and economic losses could be large as facilities could be flooded and services interrupted. School and road closures could occur. Road closures would impede both evacuation routes and ability of first responders to quickly respond to calls for aid. Other problems connected with levee failure flooding include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

Much of the District's 500 miles of canal include a berm for entrapment of flows. These canal berms can be classified as small scale levees. Failure of the levee allows irrigation water to escape the normal water conveyance canal and causes flooding and erosion of the natural landscape. In some cases, these levee breaches can cause damages to private properties.

Assets at Risk

Water and Canal Systems are the assets at risk of a levee failure

Pandemic

Likelihood of Future Occurrence—Occasional

Vulnerability—High

Hazard Profile and Problem Description

According to the World Health Organization (WHO), a disease epidemic occurs when there are more cases of that disease than normal. A pandemic is a worldwide epidemic of a disease. A pandemic may occur when a new virus appears against which the human population has no immunity.

A pandemic occurs when a new virus emerges for which people have little or no immunity, and for which there is no vaccine. This disease spreads easily person-to-person, causes serious illness, and can sweep across the country and around the world in a very short time. The U.S. Centers for Disease Control (CDC) and Prevention has been working closely with other countries and the WHO to strengthen systems to detect outbreaks of that might cause a pandemic and to assist with pandemic planning and preparation. An especially severe pandemic could lead to high levels of illness, death, social disruption, and economic loss.

Location and Extent

During a pandemic, the whole of the District, County, and surrounding region is at risk, as pandemic is a regional, national, and international event. The speed of onset of pandemic is usually short, while the duration is variable, but can last for more than a year as shown in the 1918/1919 Spanish Flu. There is no scientific scale to measure the magnitude of pandemic. Pandemics are usually measured in numbers affected by the pandemic, and by number who die from complications from the pandemic.

Past Occurrences

There has been one state and federal disaster declaration due to pandemic, as shown in Table J-10.

Table J-10 Placer County – State and Federal Pandemic Disaster Declarations 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Pandemic	1	2020	1	2020

Source: Cal OES, FEMA

The 20th century saw three outbreaks of pandemic.

- The 1918-1919 Influenza Pandemic (H1N1)
- The February 1957-1958 Influenza Pandemic (H2N2)
- The 1968 Influenza Pandemic (H3N2)

To date, the 21st century has seen two acknowledged pandemics.

- 2009 Swine Flu (H1N1)
- 2019/2020 COVID 19

Vulnerability to and Impacts from Pandemic

Pandemics have and will continue to have impacts on human health in the region. A pandemic occurs when a new virus emerges for which there is little or no immunity in the human population; the virus causes serious illness and spreads easily from person-to-person worldwide. There are several strategies that public health officials can use to combat a pandemic. Constant surveillance regarding the current pandemic, use of infection control techniques, and administration of vaccines once they become available. Citizens can help prevent the spread of a pandemic by staying home, or “self-quarantining,” if they suspect they are infected. Pandemic does not affect the buildings, critical facilities, and infrastructure in the District. Pandemic can have varying levels of impact to the citizens of the District and greater County, depending on the nature of the pandemic.

Impacts could range from school and business closings to the interruption of basic services such as public transportation, health care, and the delivery of food and essential medicines. Hospitalizations and deaths can occur, especially to the elderly or those with pre-existing underlying conditions. As seen with Covid-19, multiple businesses were forced to close temporarily (some permanently), and unemployment rose significantly. Supply chains for food and essentials can be interrupted.

Assets at Risk

Pandemics do not affect District facilities, but can affect District personnel who operate District facilities.

Severe Weather: Extreme Heat

Likelihood of Future Occurrence—Highly Likely

Vulnerability—Medium

Hazard Profile and Problem Description

According to FEMA, extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. Heat kills by taxing the human body beyond its abilities. In extreme heat and high humidity, evaporation is slowed, and the body must work extra hard to maintain a normal temperature.” Most heat disorders occur because the victim has been overexposed to heat or has over-exercised for his or her age and physical condition. Older adults, young children, and those who are sick or overweight are more likely to succumb to extreme heat.

In addition to the risks faced by citizens of the District, there are risk to the built environment from extreme heat. While extreme heat on its own does not usually affect structure, extreme heat during times of drought can cause wildfire risk to heighten. Extreme heat and high winds can cause power outages and PSPS events, causing issues to buildings in the District.

Extreme heat events are closely related to drought, climate change, and tree mortality when it comes to impacts to District operations. Extreme heat events can range in severity and duration, leading to varying increases in water demand/use along with hazardous work conditions for employees who work outdoors to maintain District function. Extreme heat events typically occur at lower elevations in western Nevada County and can last for short or long periods of time, though climate change may create variations to these

conditions that push the reach of affected areas higher in elevation for a longer duration. Extreme heat events can have fatal effects on native vegetation and trees, leading to stress, partial/complete failure, or increased mortality. Extreme heat events have the potential to cause earlier melt off of snowpack, should these events occur earlier in the summer, leading to water availability issues in the late summer when resources are needed most.

Extreme Heat and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Location and Extent

Heat is a regional phenomenon and affects the whole of the District. Heat emergencies are often slower to develop, taking several days of continuous, oppressive heat before a significant or quantifiable impact is seen. Heat waves do not strike victims immediately, but rather their cumulative effects slowly affect vulnerable populations and communities. Heat waves do not generally cause damage or elicit the immediate response of floods, fires, earthquakes, or other more "typical" disaster scenarios.

The NWS has in place a system to initiate alert procedures (advisories or warnings) when extreme heat is expected to have a significant impact on public safety. The expected severity of the heat determines whether advisories or warnings are issued. The NWS HeatRisk forecast provides a quick view of heat risk potential over the upcoming seven days. The heat risk is portrayed in a numeric (0-4) and color (green/yellow/orange/red/magenta) scale which is similar in approach to the Air Quality Index (AQI) or the UV Index. This can be seen in Section 4.3.2 of the Base Plan.

NID covers both the lower and upper elevations of the County. Separate location and extent discussions for these areas follow. Lower elevations of the District Service area are more vulnerable to extreme heat events as average temperature in these areas are lower than those seen in higher elevations. High elevation forest communities may experience stress from extreme heat events as the likelihood of extreme heat at these elevations and the forest community's natural adaptations to extreme heat may be low.

Past Occurrences

There has been no federal or state disaster declarations in the County for heat. The District Planning Team noted that since extreme heat is a regional phenomenon, events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.2.

The district has been affected economically by PSPS shutdowns. Because it is not reasonable for a water utility to halt operations for any extended period of time, the District has invested in backup generators at key facilities so there is no interruption in service. These facility upgrades cost \$296,974 and NID's hydropower generation is also significantly affected during this power shut-off events.

The District has experienced multiple PSPS related outages during the event period. The loss of power at District facilities has limited both treated and irrigation water supply availability within Placer County. The District was able to mitigate these events with the rental of portable generators, however this is a temporary solution. Future mitigation will occur with the installation of a permanent stationary generator at the North Auburn Water Treatment Plant.

Vulnerability to and Impacts from Extreme Heat

The District experiences temperatures in excess of 100°F during the summer and fall months. The temperature moves to 105-110°F in rather extreme situations. During these times, drought conditions may worsen. Also, power outages and PSPS events may occur during these times as well. Health impacts, including loss of life, are the primary concern with this hazard, though economic impacts are also an issue.

Days of extreme heat have been known to result in medical emergencies, and unpredictable human behavior. Periods of extended heat and dryness (droughts) can have major economic, agricultural, and water resources impacts. Extreme heat can also dry out vegetations, making it more vulnerable to wildfire ignitions.

District powerhouses, water treatment plants and offices all run on external power provided by PG&E. In the event of prolonged PSPS events, these assets run a vulnerability risk.

Assets at Risk

District powerhouses, water treatment plants and offices are at risk from this hazard. A PSPS event affects the District's North Auburn Water Treatment Plant, and the Edgewood and Magnolia canal systems.

Severe Weather: Freeze and Snow

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to the NWS and the WRCC, winter snowstorms can include extreme cold and freezing temperatures, heavy snow, ice, and blizzard conditions. Heavy snow can immobilize a region, stranding commuters, stopping the flow of supplies, and disrupting emergency and medical services. Accumulations of snow can collapse roofs and knock down trees and power lines. In rural areas, homes and farms may be isolated for days, and unprotected livestock may be lost. The cost of snow removal, damage repair, and business losses can have a tremendous impact on cities and towns.

Heavy accumulations of ice can bring down trees, electrical wires, telephone poles and lines, and communication towers. Communications and power can be disrupted for days until the damage can be repaired. Power outages can have a significant impact on communities, especially critical facilities such as public utilities. Even small accumulations of ice may cause extreme hazards to motorists and pedestrians.

Some winter storms are accompanied by strong winds, creating blizzard conditions with blinding wind-driven snow, severe drifting, and dangerous wind chills. Strong winds accompanying these intense storms and cold fronts can knock down trees, utility poles, and power lines. Blowing snow can reduce visibility to only a few feet in areas where there are no trees or buildings. Serious vehicle accidents with injuries and deaths can result. Freezing temperatures can cause significant damage to the agricultural industry.

Extreme Cold/Freeze and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

Location and Extent

NID covers both the lower and upper elevations of the County. Separate location and extent discussions for these areas follow.

Freeze and snow are regional issues, meaning the entire District is at risk to cold weather and freeze events. While there is no scale (i.e. Richter, Enhanced Fujita) to measure the effects of freeze, the WRCC reports that in a typical year, minimum temperatures fall below 32°F on 22.6 days with 0 days falling below 0°F

in western Placer County. Snowfall is measured in depths, and the WRCC reports that average snowfall on the western side of the County is 1.4 inches. Freeze and snow has a slow onset and can generally be predicted in advance for the County. Freeze events can last for hours (in a cold overnight), or for days to weeks at a time. Snow event can last for hours or days, but is more unlikely in the western portion of the County. When it does snow, the snow often melts relatively quickly.

Freeze and snow are regional issues, meaning the entire District is at risk to cold weather and freeze events. While there is no scale (i.e. Richter, Enhanced Fujita) to measure the effects of freeze, the WRCC reports that in a typical year, minimum temperatures fall below 32°F on 209.0 days with 0.4 days falling below 0°F in eastern Placer County. Snowfall is measured in depths, and the WRCC reports that average snowfall on the eastern side of the County is 190.7 inches. Freeze and snow has a slow onset and can generally be predicted in advance for the County. Freeze events can last for hours (in a cold overnight), or for days to weeks at a time. Snow event can last for hours or days, and the snow stays all winter in the eastern portion of the County, often with significant snow depths.

Past Occurrences

There has been no federal and one state disaster declarations in the County for freeze and snow, as shown on Table J-11.

Table J-11 Placer County – State and Federal Disaster Declarations from Freeze and Snow 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Freeze	1	1972	0	–

Source: Cal OES, FEMA

The District noted that cold and freeze is a regional phenomenon; events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.3.

Past freeze / snow events have led to disruption of water flow in the Districts Mountain Division. In 2017, a heavy snow event occurred that halted access to the Districts facilities that supply water to the Placer County corridor. In addition to the flow issues, snow had filled in the canal. Crews initially tried access via helicopter, but continue inclement weather limited that. Eventually, crews utilized snow cats to gain access an event that took multiple days to gain access and another couple of days to clear snow from the canal. This is just a single example of how freeze and snow events could detrimentally affect water supplies. These events happen on a regular basis.

Vulnerability to and Impacts from Severe Weather: Freeze and Snow

NID is subject to multiple hazards during severe freeze events. First, NIDs High Sierra facilities are vulnerable to freezing so severe that the waters within the supply canals become solid ice. When this occurs, water deliveries to the system become impossible. NID has experienced multiple events where crews were sent out day and night to break ice to keep water flowing to critical water treatment facilities.

Second, freezing in the lower reaches of NID's service area where customers are not acclimated or prepared for cold temperatures causes freezing of water distribution systems and burst pipes. Once the pipes thaw, water free flows through the broken pipes and creates water demands that NID treatment systems have a tough time keeping up with.

Lastly severe winter weather with freezing and heavy snow makes access to the District's mountain division conveyance facilities nearly impossible. The District is equipped with snow cats, snow mobiles, and tracked sided by sides, yet access during inclement weather can takes days.

Assets at Risk

The District's Water Canal Systems are at risk from this hazard.

Severe Weather: Heavy Rains and Storms

Likelihood of Future Occurrence–Highly Likely

Vulnerability–High

Hazard Profile and Problem Description

Storms in the District occur annually and are generally characterized by heavy rain often accompanied by strong winds and sometimes lightning and hail. Approximately 10 percent of the thunderstorms that occur each year in the United States are classified as severe. A thunderstorm is classified as severe when it contains one or more of the following phenomena: hail that is three-quarters of an inch or greater, winds in excess of 50 knots (57.5 mph), or a tornado. Heavy precipitation in the District falls mainly in the fall, winter, and spring months, depending on the location in the County.

Location and Extent

Heavy rain events occur on a regional basis. Rains and storms can occur in any location of the District. All portions of the District are at risk to heavy rains. Most of the severe rains occur during the fall, winter, and spring months. There is no scale by which heavy rains and severe storms are measured. Magnitude of storms is measured often in rainfall and damages. The speed of onset of heavy rains can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of severe storms in California, Placer County, and the District can range from minutes to hours to days. Information on precipitation extremes can be found in Section 4.3.4 of the Base Plan.

Past Occurrences

There have been past disaster declarations from heavy rains and storms, which were discussed in Past Occurrences of the flood section above. According to historical hazard data, severe weather, including heavy rains and storms, is an annual occurrence in the District. This is the cause of many of the federal disaster declarations related to flooding. Heavy rain, thunderstorm activity, and hail usually occur on an annual basis in the NID service area.

Vulnerability to and Impacts from Heavy Rain and Storms

Heavy rain and severe storms are the most frequent type of severe weather occurrences in the District. These events can cause localized flooding. Elongated events, or events that occur during times where the ground is already saturated can cause 1% and 0.2% annual chance flooding. Wind often accompanies these storms and has caused damage in the past. Hail and lightning are rare in the District.

Actual damage associated with the effects of severe weather include impacts to property, critical facilities (such as utilities), and life safety. Heavy rains and storms often result in localized flooding creating significant issues. Roads can become impassable and ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Floodwaters and downed trees can break utilities and interrupt services.

During periods of heavy rains and storms, power outages can occur. These power outages can affect pumping stations and lift stations that help alleviate flooding. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Often during heavy rain events, the raw water distribution system can be impacted. Heavy runoff from storm activity can cause excessive water in District canals resulting in an overtopping of the canal. An overtopping will washout the canal berm resulting in localized flood damage and interruption of the water supply. On an annual basis the District receives 20 to 40 claims stemming from these overtopping events.

Assets at Risk

The District's Water Canal Systems are of the greatest risk to heavy rains and storms.

Severe Weather: High Winds and Tornadoes

Likelihood of Future Occurrence—Highly Likely

Vulnerability—Medium

Hazard Profile and Problem Description

High winds, as defined by the NWS glossary, are sustained wind speeds of 40 mph or greater lasting for 1 hour or longer, or winds of 58 mph or greater for any duration. High winds can cause significant property and crop damage, threaten public safety, and have adverse economic impacts from business closures and power loss. High winds can also cause PSPS events.

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes form when cool, dry air sits on top of warm, moist air. Tornadoes are the most powerful storms that exist. Tornadoes, though rare, are another severe weather hazard that can affect areas of the Placer County Planning Area, primarily during the rainy season in the late fall, winter, and early spring, primarily in the western part of the County.

Location and Extent

The entire District is subject to significant, non-tornadic (straight-line), winds. Each area of the County is at risk to high winds. Magnitude of winds is measured often in speed and damages. These events are often part of a heavy rain and storm event, but can occur outside of storms. The speed of onset of winds can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of winds in California is often short, ranging from minutes to hours. The Beaufort scale is an empirical 12 category scale that relates wind speed to observed conditions at sea or on land. Its full name is the Beaufort Wind Force Scale. The Beaufort Scale was shown in Section 4.3.5 of the Base Plan.

Portions of the County are also located in a special wind hazard region, which is a result of foehn winds. A foehn wind is a type of dry down-slope wind that occurs in the lee (downwind side) of a mountain range. Winds of this type are called "snow-eaters" for their ability to make snow melt or sublimate rapidly. This snow-removing ability is caused not only by warmer temperatures, but also the low relative humidity of the air mass coming over the mountain(s). They are also associated with the rapid spread of wildfires, making some regions which experience these winds particularly fire prone.

Tornadoes, while rare, can occur at any location in the County and District, but would more likely occur in Western Placer. Prior to February 1, 2007, tornado intensity was measured by the Fujita (F) scale. This scale was revised and is now the Enhanced Fujita scale. Both scales are sets of wind estimates (not measurements) based on damage. The new scale (EF) provides more damage indicators (28) and associated degrees of damage, allowing for more detailed analysis and better correlation between damage and wind speed. It is also more precise because it considers the materials affected and the construction of structures damaged by a tornado. The F Scale and EF Scale are shown in Section 4.3.5 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for winds and tornadoes. The District noted that since high winds is a regional phenomenon, events that affected the lower and middle elevations of the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.5.

Vulnerability to and Impacts from Severe Weather: Wind and Tornado

High winds are common occurrences in the District throughout the entire year. Straight line winds are primarily a public safety and economic concern. Windstorm can cause damage to structures and power lines which in turn can create hazardous conditions for people. Debris flying from high wind events can shatter windows in structures and vehicles and can harm people that are not adequately sheltered. High winds can impact critical facilities and infrastructure and can lead to power outages. Wind can also drive wildfire flames, spreading wildfires quickly. During periods of high winds and dry vegetation, wildfire risk increases. High winds that occur during periods of extreme heat can cause PSPS events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Impacts from high winds in the District will vary. Future losses from straight line winds include:

- Downed trees
- Power line impacts and economic losses from power outages
- Increased PSPS events
- Occasional building damage, primarily to roofs

Assets at Risk

All District assets from Table J-4 are at risk from this hazard.

Tree Mortality

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer and Nevada County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, effect overall forest health, and contribute to future fuel loads in forests surrounding communities. During extended drought, tree mortality is driven by a build-up in endemic bark beetle populations and exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events.

Location and Extent

Onset of tree mortality events can be relatively fast; however conditions – such as high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas, and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 - 40 dead trees per acre
- Orange depicting 5 -15 dead trees per acre
- Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A number of Placer County areas were designated during this event and the majority of Placer County watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality, along with numerous Tier 1 High hazard “hot spots”. A map of these areas was shown in in Section 4.3.18 of the Base Plan.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015.

Tree mortality is a risk to the District's canal systems. As trees die and rot, they become weak and fall. In 2013, the District experienced a wind event that caused many of the standing dead trees to fall across elevated fume sections of the District's water supply canal. The District coordinated with PG&E on clean up and repair which took over a month. During this time, District customers were required to conserve water use until repairs could be completed.

The District budgets tens of thousands of dollars annually for hazard tree removal in campgrounds where public safety is paramount and at other vulnerable District facilities, including the vicinity around water treatment plants.

Vulnerability to and Impacts from Tree Mortality

Placer and Nevada Counties are unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the counties.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead trees within the wildland urban interface (WUI) or urban areas pose a greater risk to due to their proximity to residents, businesses, and road, power, water, and communication infrastructure than dead or dying trees pose in remote areas with no nearby structures, infrastructure or recreation areas.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure.

The District owns open watershed lands as well as properties in the WUI which contain key infrastructure and recreation areas with numerous potential targets. Depending on the size and location of hazard trees, removal of part or all of the tree can be both difficult, risky, and costly in some cases. Every year, trees are identified on District property that are adjacent to significant targets, both District-owned and private. The District is vulnerable to the risk of damage caused by tree failure, the financial burden of preemptive removal, and the potential liability of neglecting to remove significant hazards on time.

In addition to infrastructure and human health and safety concerns, excessive tree mortality has an impact on forest health and wildfire risk in affected stands. Trees killed by pests and disease have the potential to

spread these illnesses to healthy live trees, decreasing overall forest health. Downed and standing dead and dry woody material additionally increases the risk of extreme wildfire, leading to a potential loss of large tracts of forest land. This has significant effects on water quality and quantity, water availability, and sedimentation into liquid storage reservoirs. Post wildfire forests may take many decades to recover, and they have significant impacts on downstream storage reservoirs and water system infrastructure.

Assets at Risk

Most notable assets at risk are canal systems, campgrounds, buildings/structures, and power lines in striking distance from dead, dying, or damaged trees.

Wildfire

Likelihood of Future Occurrence—Highly Likely

Vulnerability—High

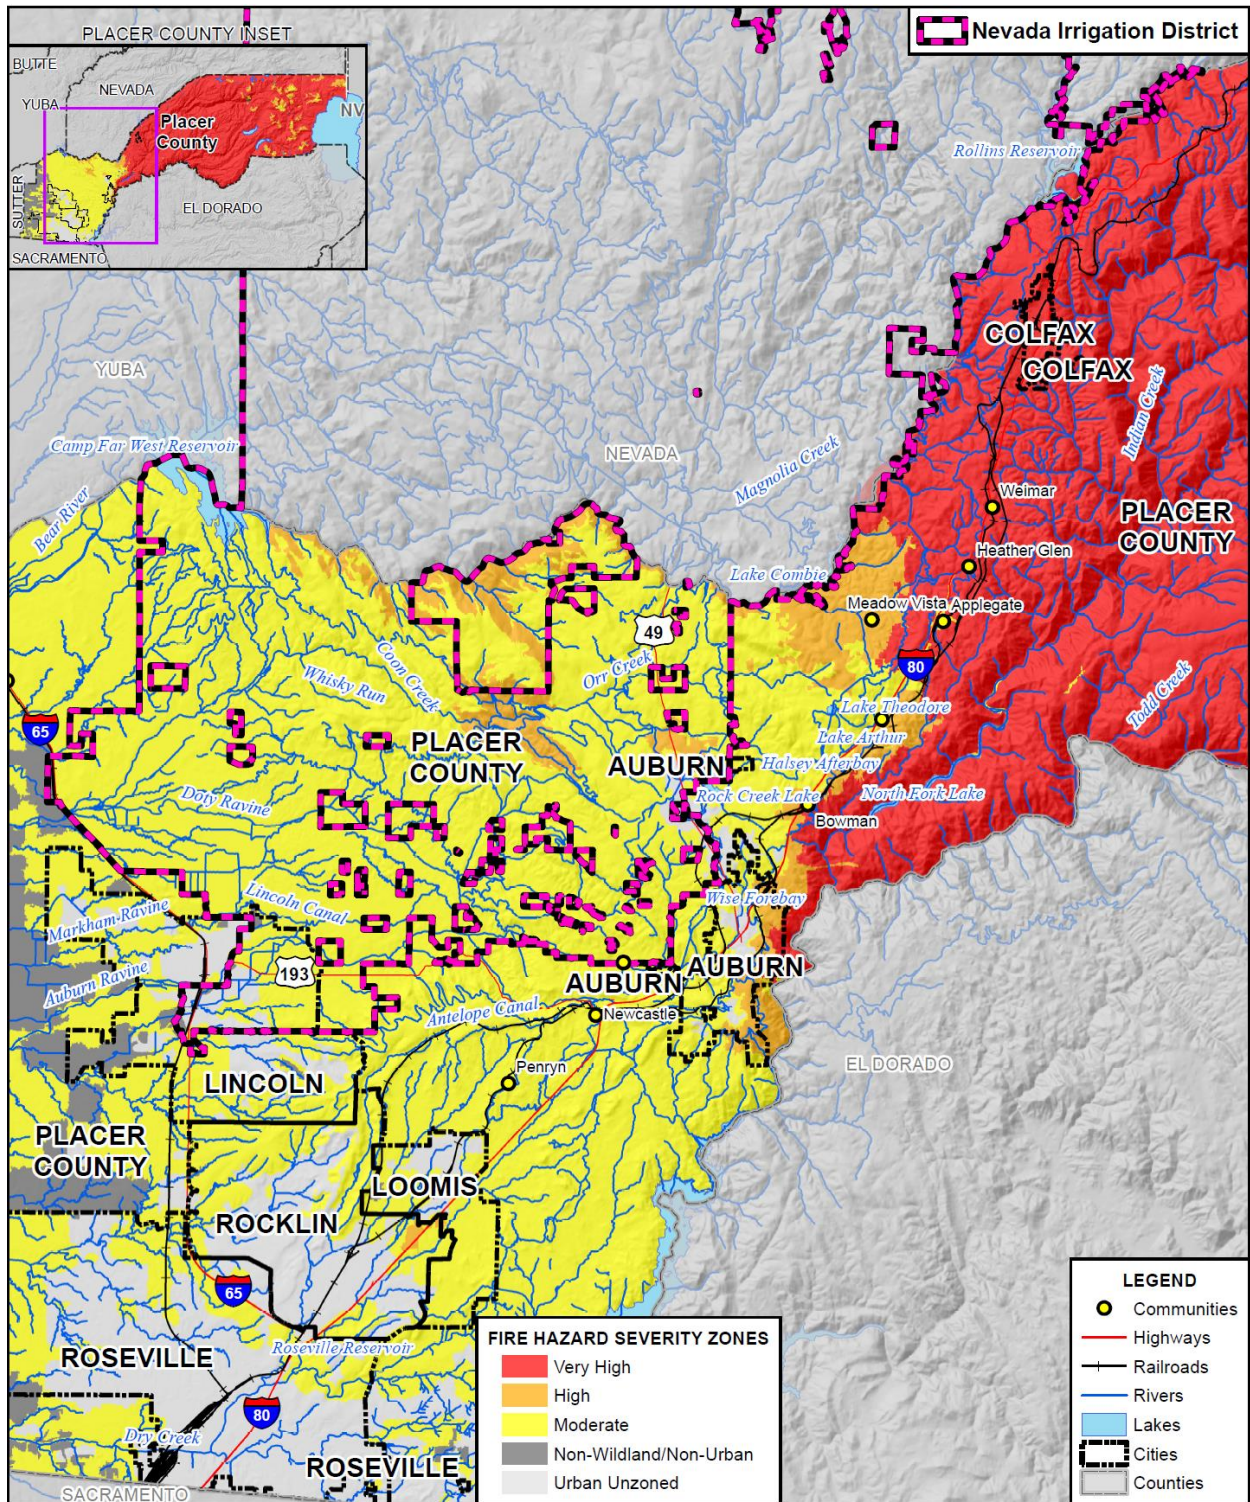

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the NID. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural fire regime. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the NID were created. Figure J-5 shows the CAL FIRE FHSZ in the District. As shown on the maps, FHSZs within the District range from Urban Unzoned to Very High.

Figure J-5 NID – Fire Hazard Severity Zones

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table J-12.

Table J-12 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

The Washoe Fire in August **2007** had impacts to the NID. This fire occurred in the wildland urban interface area of the Tahoe Park and Tahoe Woods subdivisions, along the west shore of Lake Tahoe. Although no lives were lost, the fire destroyed 5 residential structures and encompassed 19 acres. Power and gas utilities incurred damages. There were also losses to timber assets, loss of watershed protection, and loss of the aesthetic value of a scenic corridor. This event caused major disruptions to the west shore and Tahoe City traffic and business on a busy summer weekend. Highway 89 in West Lake was closed for a period of time.

2009. The wind driven 49er Fire occurred in the urban sections of North Auburn and burned through the Districts North Auburn Water Treatment Plant. 62 homes were destroyed and infrastructure damaged. Power remained out for multiple days making the production of potable water to the area difficult.

2015 The Lowell Hill burned along Bear River corridor and through many of the of the District’s water conveyance facilities. Access to canal systems was impossible and the threat of contaminants from firefighting activities was a concern. In addition, the Districts powerhouses were knocked offline during the event.

The most notable recent wildfire to impact the District was the Jones Fire in 2020. The wind driven fire occurred in the South Yuba River canyon and burned over the Districts Newtown Canal. 21 structures and 705 acres were burned during the 12 day fire, having impacts to communities as well as infrastructure and the health of the landscape within the burn area.

Air quality considerations are a vulnerability when particulate AQI index reaches unhealthy levels, it becomes a safety concern for staff to be in the field. Additional PPE and rest periods are necessary to keep staff safe.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this

section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

The size in acreage and the severity of wildfire in California is increasing. Five of the top twenty largest California wildfires occurred in 2020. The deadliest and most destructive of which was the Camp Fire which burned over 150,000 acres, 18,000 structures, and caused at least 85 fatalities in 2018. The massive scale of this wildfire had significant impacts to not only the public, but utility infrastructure as well. Costs of disaster related debris removal, emergency protective measures to protect life and property, and permanent repair to damaged or destroyed infrastructure, including repair and replacement of Paradise Irrigation District's water system features, reached more than \$129 million,

All of the Districts Mountain Division infrastructure is located within an extreme fire threat zone. A major fire in this area has the potential to cut off water supply to Placer County. In addition, District infrastructure is vulnerable to burning during a fire. Damage to any of these facilities may take a long period of time to facilitate repairs.

Assets at Risk

All District assets are vulnerable to wildfire damages.

J.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

J.6.1. Regulatory Mitigation Capabilities

Table J-13 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the NID.

Table J-13 NID Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	Y	Last update 2011. The plan covers the expected expansion of District facilities over the next 30 years. The hazards covered include the expected flow ranges thus allowing for upsizing of pipes and canals to prevent storm water flooding. The District is in the process of updating this Raw Water Master Plan in the fall of 2021.
Capital Improvements Plan	Y	Ongoing annually. Projects are initiated based on Master Planning, facility inspection, and available capacity.
Economic Development Plan		N/A
Local Emergency Operations Plan	Y	The District has multiple Emergency Plans that are updated annually. These plans cover emergencies ranging from treated water supply to a major dam failure.
Continuity of Operations Plan		In development
Transportation Plan		N/A
Stormwater Management Plan/Program	Y	Storm water management is covered by District policy. The policy states all future facilities will be designed in a manner that does not allow storms water to infiltrate District canals.
Engineering Studies for Streams	Y	Studies are ongoing for stream health, flow rates, and ramping rates.
Community Wildfire Protection Plan	N	Covered in our Emergency Response Plans.
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)		The District also maintains a drought contingency plan to assist water management during periods of drought or water supply shortages, a Public Safety Plan for FERC Facilities, an Owner's Dam Safety Plan for dams; a Vegetation Management Plan for powerhouses, powerlines, penstocks, and canals/flumes; and an Illness and Injury Prevention Plan.
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	N/A	Version/Year: N/A

Building Code Effectiveness Grading Schedule (BCEGS) Score	N/A	Score:
Fire department ISO rating:	N/A	Rating:
Site plan review requirements	N/A	
		Is the ordinance an effective measure for reducing hazard impacts?
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	N/A	
Subdivision ordinance	N/A	
Floodplain ordinance	N/A	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N/A	
Flood insurance rate maps	N/A	
Elevation Certificates	N/A	
Acquisition of land for open space and public recreation uses	N/A	
Erosion or sediment control program	N/A	
Other	N/A	
How can these capabilities be expanded and improved to reduce risk?		
The District will continue to update and add to plans that mitigate hazards in the District.		

Source: NID

As indicated above, the District has several programs, plans, policies, and codes and ordinances that guide hazard mitigation. Some of these are described in more detail below.

NID Agricultural Water Management Plan, 2015 – Updated 2021

The Agricultural Water Management Planning Act requires all agricultural water suppliers that provide water to 10,000 or more irrigated acres to adopt and submit an AWMP to the California Department of Water Resources (DWR). The purpose of the Act is to evaluate water use and applicable management practices to make the best use of available resources. The District’s AWMP also addresses the new AWMP requirements established by the Governor in Executive Order B-29-15 (April 1, 2015), and listed below.

- Prepare a Drought Management Plan that describes the actions and measures the supplier will take to manage water demand during drought; and,
- Quantify water supplies and demands for 2013, 2014, and 2015, to the extent data is available.

This AWMP addresses the District’s water system and includes a description of the service area, water uses, water resources, and a comparison of water supply and water demands during the planning cycle (2011 through 2015). Also described are the District’s water supply reliability, water use efficiency information, water shortage allocation policies, and Drought Management Plan. Urban Water management Plan, 2015 – Updated 2021 The Urban Water Management Planning Act requires every urban water supplier providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually to adopt and submit a UWMP every five years to the California Department of Water Resources (DWR). The Act describes the contents of the UWMP as well as how

urban water suppliers should adopt and implement the UWMP. This UWMP addresses the District’s water system and includes a description of the service area, water use, water supply sources, and a comparison of water supply and water demands during normal, single dry, and multiple-dry years. Also described is the District’s water conservation program.

Raw Water Master Plan, 2013 – Updated 2022

Nevada Irrigation District’s Plan for Water was last updated in 2005 and adopted in 2013. The plan helps guide decisions related to the water system over the next 50 years. Long range planning ultimately involves forecasting & projecting future conditions based on realistic, valid and supportive assumptions. Regardless of the technology, science, or process used, assumptions still must be made to produce a forecast. The District is updating the plan to reflect changes in water demand, supply and the potential effects of climate change. The plan is an organizational tool that seeks to align resource decision making with community values and District operational needs, including technical and cost criteria requirements. When complete the plan will show how a variety of future water supply and demand scenarios could be integrated to ensure our community enjoys the same high-quality, reliable water system we have now. The Plan for Water is born of the FERC relicensing effort, climate change impacts, financial requirements, and new regulatory requirements. The Plan for Water does not re-analyze or revisit any new requirements set by FERC or the State. Instead, it sets these requirements as the new normal, and looks ahead 50 years to anticipate potential supply/demand scenarios and identify alternative solutions

Vegetation Management Plan

The Vegetation Management Plan (“VMP”) addresses vegetation modification guidelines and best practices to minimize wildfire risk associated with the District’s powerhouses and related transmission lines, penstocks, and flumes located within the District’s boundary in both Nevada County and Placer County, California. The VMP has been developed to identify best management practices for vegetation management methods and applications for the District’s seven (7) powerhouses and their associated transmission lines, penstocks, and canals/flumes. The VMP was also developed with the inclusion of invasive weed management, revegetation, and human and resource protection measures as appropriate. The purpose of the VMP is to provide fire prevention procedures, reporting, and safe fire avoidance and suppression practices for District personnel and contractors responsible for operating and maintaining the existing District hydroelectric facilities. A primary purpose of the VMP is to establish procedures and protocols for management of native vegetation and treatment of invasive weeds in order to maintain a desirable environmental condition that is consistent with the safe and effective operation and maintenance (O&M) of District hydroelectric facilities. The VMP contains descriptions of specific vegetation management actions, including treatment of invasive weeds, which the District will use to achieve desired conditions in and around project-related transmission corridors, hydroelectric facilities, and access roads that are associated with each of the District’s seven powerhouses. The vegetation management strategies outlined in the VMP describe how the District will achieve a variety of desired conditions, dependent on the type of site, from bare ground (powerhouses and switchyards) to compatible native vegetation communities (penstocks and transmission corridors).

Emergency Action Plan

The Emergency Action Plan (EAP) is to reduce the risk of loss of life, injuries, and damage to property that could occur in the unlikely event of a failure or operational incident at one or more of the Nevada Irrigation District (NID/District) facilities covered by the EAP.

It has been determined that water storage behind the dams making up the Yuba-Bear Project, Combie Dam, Scotts Flat Dam, Deer Creek Diversion Dam, and Loma Rica Airport Dam may present a potential hazard to downstream inhabitants and property in the event of a dam failure. To minimize the chances for loss of life and damage to property, it is important to respond quickly to a potentially hazardous situation and to provide a coordinated effort with clearly assigned areas of responsibilities.

Timely detection and identification of a dam safety emergency is a necessary component of planning and operation of dam facilities. Once an emergency situation is identified, proper evaluation, classification, and notification to internal and external agencies is critical for reducing downstream effects and the potential for loss of life. The EAP includes preventative and mitigation actions for responding to potential or active dam safety emergencies. The EAP is intended to provide information and structure to assist the District and emergency responders with executing a coordinated and effective emergency response. The EAP is a confidential document and not available to the general public.

Healthy Forest Management and Wildfire Mitigation Plan

NID owns nearly 6,000 acres of forested land, generally located in borders around storage reservoirs and in scattered parcels where District infrastructure is located. Strategic forest management is therefore necessary for the District and those that rely on its water supply for the protection of source water, the water system, ecosystem values, and human health and property. The past 30 years of reduced logging and over a century of suppressing the frequent, low to moderate-intensity fire cycles with which local forest communities evolved, has led to overcrowded forest conditions that are at-risk of unnaturally severe wildfire. This plan is intended to provide management guidelines that include: an overview of the District's forest land, forest issues, program objectives and action items, and supporting information. The priority objectives of the District's forestry program involve significantly reducing the risk of wildfire ignition and hazardous trees around storage reservoirs, hydroelectric and treatment facilities, water conveyance infrastructure and within recreation areas, where risks to human health and safety, water supply, and system operation are highest.

Water Planning Projections

The Water Planning Projections consists of three studies that analyze the hydrology, water supply and water demand that help NID determine if its water storage and delivery system will provide sufficient water to meet customer demands over time and under variable conditions. The Water Planning Projections are used to prepare a number of planning reports such as the Urban Water Management Plan and the Agricultural Management Plan required to be updated and submitted to the State of California every five years. The Water Planning Projections is also used to prepare the District's Plan for Water, formerly called a Raw Water Master Plan, and is considered when making decisions about capital improvements to its water storage and delivery system.

Owner's Dam Safety Program

NID owns, operates, and maintains dams and the associated appurtenant works. Under normal circumstances, these assets produce hydroelectric power and water for consumptive and irrigation uses. Under adverse conditions, such as those related to hydrologic, geologic, and seismic hazards, these assets may pose a risk to lives and property. It is the objective of NID to mitigate these risks and maintain the long-term safe and reliable operation of these assets. It is the policy of NID to continue the safe operations of the dam inventory and associated appurtenant works, while maintaining compliance with all applicable laws and regulations. The purpose of the Owner's Dam Safety Program (ODSP) is to manage the safety of the District dams and their ancillary facilities for the protection of life, property, and the environment. The ODSP is intended to ensure that NID's Board of Directors, Management, Chief Dam Safety Coordinator (CDSC), Dam Safety Engineer (DSE), dam operational, maintenance, and engineering staff, consultants, construction contractors, and other agents have a good understanding and constant awareness of the ongoing need to watch for and improve the safety of the dams to ensure the safety of the public. This ODSP is applied to all the District Dams and the ancillary facilities under the jurisdiction of Federal Energy Regulatory Commission (FERC) or California Division of Safety of Dams (DSOD). These include FERC's Yuba-Bear Project (P-2266), Combie Dam Project (P-2981), Scotts Flat Dam Project (P-5930), and Loma Rica and Deer Creek Diversion Dams (both are DSOD jurisdiction only). The ODSP also applies to the spillways, penstocks, outlet structures, instruments, reservoirs, and stream beds associated with the dams.

Drought Contingency Plan

The purpose of the Nevada Irrigation District's Drought Contingency Plan is to provide guidance to staff and customers to help minimize drought or water supply shortage impacts. The plan identifies drought action levels, appropriate agency responses, water demand reduction goals, and provides recommended demand management measures to assist customers in water conservation. The mandatory reduction measures implemented through this plan are designed to preserve minimal supplies for public health and safety. Mandatory reduction stages will trigger the formation of the Drought Hardship Committee whose purpose is to review hardship applications and determine whether additional water can be provided to the applicants with an economic hardship and/ or those utilizing best management practices.

Nevada Irrigation District Public Safety Plan

The purpose of the Public Safety Plan is to describe the hazards that exist at or near hydropower facilities and operations, and the safety devices or other measures that are employed to enhance the protection of the public that utilize the Nevada Irrigation District's (NID) Yuba-Bear, Scotts Flat, and Combie Hydroelectric Projects (Projects) land and water. The Federal Energy Regulatory Commission (FERC) is primarily concerned with the hazards created by Project structures and operations. However, hazards created by natural conditions in Project waters and at recreational areas operated or leased by licensees of hydropower projects are equally important. The Projects are a series of dams, reservoirs, forebays, afterbays, tunnels, pipelines, conduits, powerhouses, transmission lines, roads, and structures needed to operate and maintain the District's facilities. The purpose of the Projects is to store and provide water for irrigation and domestic use and to generate electrical power as a secondary use.

Because the dams, reservoirs, roads and other features are located in a mountainous area that has great attraction for recreation, these Project facilities also serve as recreational facilities. However, the primary purpose of each of these facilities is to supply water to downstream users. Thus, while the primary purpose is to provide water and power, recreational use of the facilities is an important part of operations, and great effort is put into making this use as safe as possible while still meeting Project goals and commitments.

NID is committed to public safety. The District will continue to regularly review their current operating procedures, and where applicable and practical, modify them to improve safety within the Projects.

Continuity of Operations Plan

This Plan provides guidance to NID and will ensure essential functions and services are maintained during an influenza pandemic. This Plan neither replaces nor supersedes any current, approved continuity plan; rather it supplements it, bridging the gap between traditional, all-hazards continuity planning and the specialized continuity planning required for a pandemic by addressing additional considerations, challenges, and elements specific to the dynamic nature of a pandemic. This Plan stresses that essential functions will be maintained during a pandemic outbreak through mitigation strategies, such as social distancing, increased hygiene, the vaccination of employees and their families, and similar approaches. Influenza may not, in itself, require a traditional continuity response, such as partial or full relocation of the organization's essential functions, although this response may be concurrently necessary due to other circumstances.

Covid-19 Prevention Plan, CPP

This CPP is designed to control exposures to the SARS-CoV-2 virus that may occur in our workplace. This CPP lives within the Codes of Safe Work Practices in the Injury and Illness Prevention Program (IIPP). The General Manager or appointee has overall authority and responsibility for implementing the provisions of this CPP in our workplace. In addition, all managers and supervisors are responsible for implementing and maintaining the CPP in their assigned work areas and for ensuring employees receive answers to questions about the program in a language they understand. All employees are responsible for using safe work practices, following all directives, policies and procedures, and assisting in maintaining a safe work environment.

Injury and Illness Prevention Program

It is the policy of the Nevada Irrigation District to provide a safe and healthful work environment for all of its employees – an environment that is absent of recognized hazards that may cause, death or serious physical harm to its employees. In an effort to achieve this goal, the District maintains an Injury and Illness Prevention Program that conforms to the best safe practices. A collectively involved and consulted workforce contributes to a work environment where health and safety are core values. NID has a basic responsibility to make the safety of employees a primary objective; at the same time, workers have a right to work in places where all risks to their health and safety are properly controlled. The successful operation of the District depends not only on service to the public, but also how safely each job is performed.

J.6.2. Administrative/Technical Mitigation Capabilities

NID is governed by a five-member Board of Directors, elected to four-year terms by District voters. The board is the District’s policy-making body and policy is carried out by approximately 185 full- and part-time employees. Members of the board are elected from within and represent five geographical divisions within the District. As a state agency, NID operates under rules and regulations adopted under authority conferred by the California Water Code. NID is headquartered at an 18-acre site located on West Main Street in Grass Valley. The District also operates a maintenance yard on Gold Hill Road near Lincoln and a Hydroelectric Department office off Interstate 80 near Colfax. Table J-14 identifies the District department(s) responsible for activities related to mitigation and loss prevention in NID.

Table J-14 NID’s Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	Y	Planning a collaboration between the Districts Engineering, Operations, Maintenance and Hydroelectric Departments
Mitigation Planning Committee	Y	Mitigation Planning is a function of the planning team listed above
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Yes	The District has a fully staffed water operations maintenance and hydroelectric maintenance divisions with approximately 90 dedicated positions to keep facilities in proper order.
Mutual aid agreements	Yes	The District has mutual aid agreements with many neighboring agencies including, PG&E, PCWA, City of Grass Valley, City of Nevada City, and Placer County.
Other		
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	N/A	
Floodplain Administrator	N/A	
Emergency Manager	Yes	The District has a risk manager that will act as an emergency manager during an emergency. Table top emergency exercises are practiced with multiple agencies every 5 years. The Districts Management team has completed NIMS training
Community Planner		
Civil Engineer	Yes	The District has an in house engineering department with a staff of 6 licensed engineers trained in all aspects of District functions.
GIS Coordinator	Yes	The District has a drafting division that maintains the Districts GIS system. The group has coordinated with outside agencies during emergencies to provide mapping information.
Other		
Technical		

Warning systems/services (Reverse 911, outdoor warning signals)	Yes	The District has electronic warning systems for its dams, water treatment plants and canals. Facilities are manned or monitored on a 24 hour a day 7 day a week basis. The District also utilizes an answering service as backup.
Hazard data and information	Yes	The District maintains a current SDS data base
Grant writing	Yes	The District has an in house grant writer
Hazus analysis		
Other		
How can these capabilities be expanded and improved to reduce risk?		
Continued vigilance and a prioritization of safety and risk management will continue into the future. The District has developed its own safety department and is in the process of updating its Emergency Response Plan, and Vulnerability Assessment.		

Source: NID

J.6.3. Fiscal Mitigation Capabilities

Table J-15 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table J-15 NID's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
General Property Taxes	Yes	The District receives annual allocations of County Property taxes which are predominantly used for capital improvement projects and debt service.
Authority to levy taxes for specific purposes	Yes	The District levies taxes for the Cement Hill Community Facility District and Rodeo Flat Assessment District
Fees for water, sewer, gas, or electric services	Yes	Fees are set based on cost of service every 5 years
Capacity fees for system expansion	Yes	The District receives capacity fees used to expand the water system
Storm water utility fee	No	
Incur debt through revenue bonds and/or special tax bonds	Yes	Revenue Bonds and special taxes have both been utilized to fund projects within the District
Incur debt through private activities	No	
Community Development Block Grant	No	
Other federal funding programs	Yes	The District has been the recipient of Depart. of Water Resources grant funding
State funding programs	Yes	State Revolving Loan Funding
Other		

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
How can these capabilities be expanded and improved to reduce risk?		
A dedicated resource planning division level of staffing would greatly improve NID's ability to increase vulnerability awareness and help plan for future mitigation programs.		

Source: NID

J.6.4. Mitigation Education, Outreach, and Partnerships

Table J-16 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table J-16 NID's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Yes	The District works with Multiple NGO's that focus on watershed protection such as: SYRCL, Bear Yuba Land Trust and others that could help spread the word during emergency
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Yes	The District has a dedicated Water Efficiency Staff and a Public Information Team to help spread the water conservation message
Natural disaster or safety related school programs	N/A	
StormReady certification	N/A	The District has a storm water action plan in place that is implemented during forecasted heavy storms
Firewise Communities certification	N/A	
Public-private partnership initiatives addressing disaster-related issues	N/A	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Ongoing communication and coordination throughout traditional and social media platforms.		

Source: NID

J.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

- Updated Coordinated Operating Agreement with PG&E
- NID Regional Water Supply Project
- Cole Siphon Replacement Project
- Rock Creek Bypass Encasement Project
- Lincoln Canal Encasement Project

- North Auburn Highway 49 Transmission Project
- North Auburn Treatment Plant VFD's and Permanent Backup Generator
- Permanente generator installation at headquarters office
- Purchased additional portable generators
- Combie Phase 1 Replacement Project

In addition, acutely hazardous chlorine gas has been removed at all the Districts Water Treatment Plants. The District has switched to bleach to lessen the hazard level to the neighboring residences.

Development of interties between NID & PCWA to allow for multi-agency coordination and backup water supply. PCWA and the District have four interties that are utilized for maintenance and emergency activities. Additionally, the District has completed an emergency intertie with PG&E that will allow for an additional delivery point of raw water for both NID and PCWA. Water agreements between NID, PCWA and Placer County ensure ongoing water supply for the Placer County Government Center in Auburn.

J.7 Mitigation Strategy

J.7.1. Mitigation Goals and Objectives

The NID adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

J.7.2. Mitigation Actions

The planning team for the NID identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Avalanche
- Dam Failure
- Drought & Water Shortage
- Earthquake
- Floods: 1%/0.2% annual chance
- Floods: Localized Stormwater
- Landslides, Mudslides, and Debris Flows
- Levee Failure
- Severe Weather: Freeze and Snow
- Severe Weather: Heavy Rains and Storms
- Tree Mortality
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless

of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. 2015 Agricultural Water Management Plan – Updated 2021

Hazards Addressed: Climate Change, Drought and Water Storage Hazards, Agricultural Hazards

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The Agricultural Water Management Planning Act requires all agricultural water suppliers that provide water to 10,000 or more irrigated acres to adopt and submit an AWMP to the California Department of Water Resources (DWR). The purpose of the Act is to evaluate water use and applicable management practices to make the best use of available resources. The District’s AWMP also addresses the new AWMP requirements established by the Governor in Executive Order B-29-15 (April 1, 2015), and listed below.

- Prepare a Drought Management Plan that describes the actions and measures the supplier will take to manage water demand during drought; and,
- Quantify water supplies and demands for 2013, 2014, and 2015, to the extent data is available.

Project Description: This AWMP addresses the District’s water system and includes a description of the service area, water uses, water resources, and a comparison of water supply and water demands during the planning cycle (2011 through 2015). Also described are the District’s water supply reliability, water use efficiency information, water shortage allocation policies, and Drought Management Plan. This AWMP is the year 2015 AWMP as required by the Agricultural Water Management Planning Act (Act) (California Water Code Section 10820(a)), which requires all agricultural water suppliers that provide water to 10,000 or more irrigated acres within their service area to prepare an AWMP.

Other Alternatives:

Existing Planning Mechanism(s) through which Action Will Be Implemented: Plan For Water, Raw Water Master Plan

Responsible Agency/ Department/Partners: NID

Cost Estimate: Various

Benefits (Losses Avoided): Reduced risk to ag hazards.

Potential Funding: NID - Grants

Timeline: Within 2021

Project Priority (H, M, L): Medium

Action 2. Avalanche Mitigation

Hazards Addressed: Avalanche

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: Nevada Irrigation District has critical water supply facilities in the high alpine watershed that supply a majority of the District’s annual water needs. These facilities are located in remote, steep terrain that is subject to avalanche during heavy winters. The primary danger with an avalanche is the potential for blockage of canals and damage to the many elevated flumes relied upon for conveyance. Heavy snow in the early 1990’s blocked water flow in the South Yuba Canal and created constraints on the Districts water delivery system. Emergency pumps were brought in to pump water from Scotts Flat as a backup while the snow was cleared. The District is currently working on a permanent pumping facility as an emergency backup supply should future heavy snows or avalanches damage District facilities.

Project Description: Purchase new SnoCat and tracked UTV to improve access options. Install and provide telemetry from two new snow measurement station in Upper Division. Install and provide telemetry from two new weather stations in the Upper Division

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: No existing mechanism.

Responsible Agency/ Department/Partners: Nevada Irrigation District, California Department of Water Resources, Sierra Avalanche Center

Cost Estimate:

- SnoCat = \$225,000
- Tracked UTV = \$30,000
- Snow Measurement Stations = \$75,000
- Weather Stations = \$10,000

Benefits (Losses Avoided): Improved worker safety during snow events

Potential Funding:

Timeline: 1-5 years

Project Priority (H, M, L): Medium

Action 3. Canal Culvert Replacement Program

Hazards Addressed: Water Supply Reliability, Flood Control

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: Canal Crossings are facilitated with numerous culverts throughout the Placer County area. These culverts are often undersized, aged, and failing. During heavy rain events these culverts backup water causing flooding and overtopping of the canal upstream of the culvert. Overtopping often results in erosion of the canal berm and presents possible property damage. Nevada Irrigation District is currently engaged in a culvert replacement project aimed at resolving these issues.

Project Description: Removal and replacement of culverts and headwalls within District canals.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: The Nevada Irrigation Districts Engineering and Encroachment Departments provide oversight on these projects

Responsible Agency/ Department/Partners: Nevada Irrigation District and associated property owners

Cost Estimate: Varies per year, some projects paid for by private parties. While cost estimates varies based on size and location, average cost of culvert install is \$20,000.

Benefits (Losses Avoided): Life, Safety, Localized Flooding, Reduction in loss of private property

Potential Funding: District funding, grants

Timeline: ongoing

Project Priority (H, M, L): Medium

Action 4. Centennial Water Supply Project

Hazards Addressed: Water Supply Reliability, Climate Change, Flood Control Protection, Power Outages

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The Nevada Irrigation District is embarking on a regional water storage and supply reliability project known as Centennial Water Supply Project. The proposed project includes a water storage reservoir between Rollins and Combie Lakes. The project is necessary to bolster water supply for the surrounding regions to help combat prolonged drought, future demand needs. The project will also provide environmental benefits.

Project Description: Construct Roller Compacted Concrete Dam that will impound 110,000 ac-ft reservoir on the Bear River for water supply.

Other Alternatives: Conservation, and water use restrictions

Existing Planning Mechanism(s) through which Action Will Be Implemented: The District has just begun studying this proposed project. Currently feasibility and environmental studies are under way.

Responsible Agency/ Department/Partners: Nevada Irrigation District

Cost Estimate: 300-400 Million Dollars

Benefits (Losses Avoided): Regional water supply reliability including protection from long term drought and climate change, clean renewable power generation, and environmental benefits are a small sample of some of the highlights this project will bring forward.

Potential Funding: Still being researched, District Funding, Grants

Timeline: 10+ years

Project Priority (H, M, L): Currently low as the District focuses on Plan for Water process.

Action 5. Combie Phase 1 Replacement

Hazards Addressed: Water Supply Reliability, Flood Control, Earthquake Vulnerability

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: A majority of the water that supplies Placer County properties within the Nevada Irrigation District flows through the Combie Phase 1 Canal. The Canal has reached its life expectancy and is experiencing leakage and structural issues. The concrete flume sections are separating and the general condition of the concrete is failing. The District is the beginning stages of design for the replacement of the open canal with a pipe. This project includes the replacement of the elevated siphon crossing the Bear River. This facility has had experienced failures in the recent past that caused flood damage and extended water outages for the northern portions of Placer County.

Project Description: Removal and replacement of 54-inch aerial siphon and replace 9100 feet of concrete flume with 96-inch Reinforced Concrete Pressure Pipe.

Other Alternatives: No other financially feasible option exists.

Existing Planning Mechanism(s) through which Action Will Be Implemented: The District has completed the 54-inch aerial siphon and it is in service. Construction began for the installation of the 96-inch RCCP in 2019 and will be completed in 2021.

Responsible Agency/ Department/Partners: Nevada Irrigation District

Cost Estimate: Approximately \$27 million.

Benefits (Losses Avoided): Associated property damage and loss of water supply to the entire Placer County region and two water treatment plants.

Potential Funding: Bonds and District Capital

Timeline: Will be finished in 2021

Project Priority (H, M, L): High

Action 6. Continuity of Operations Plan

Hazards Addressed: Pandemic

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: Organizations across the Nation perform essential functions and services that may be adversely affected in the event of a natural or man-made disaster. In such events, the Nevada Irrigation District (NID/District) will have continuity plans to assist in the continuance of their essential functions. Continuing to perform essential functions and provide essential services is vital to NID's ability to remain a viable entity during times of increased threats from all hazards, manmade or natural. Since the threat to an organization's continuity of operations is great during a pandemic outbreak; it is important for organizations, in particular the Nevada Irrigation District, to have a Continuity of Operations Plan for Pandemic Influenza (Plan) in place to ensure it can carry out its essential functions and services. While organizations may be forced to suspend some operations due to the severity of a pandemic outbreak, an effective Plan will assist NID in its efforts to remain operational, as well as strengthen the ability to resume operations.

Project Description: This Plan provides guidance to NID and will ensure essential functions and services are maintained during an influenza pandemic. This Plan neither replaces nor supersedes any current, approved continuity plan; rather it supplements it, bridging the gap between traditional, all-hazards continuity planning and the specialized continuity planning required for a pandemic by addressing additional considerations, challenges, and elements specific to the dynamic nature of a pandemic. This Plan stresses that essential functions will be maintained during a pandemic outbreak through mitigation strategies, such as social distancing, increased hygiene, the vaccination of employees and their families, and similar approaches. Influenza may not, in itself, require a traditional continuity response, such as partial or full relocation of the organization's essential functions, although this response may be concurrently necessary due to other circumstances.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Injury and Illness Prevention Plan

Responsible Agency/ Department/Partners: NID

Cost Estimate: To be determined.

Benefits (Losses Avoided): Continued performance of essential functions

Potential Funding: NID - Grants

Timeline: 1-5 years

Project Priority (H, M, L): H

Action 7. Pandemic Planning

Hazards Addressed: Covid 19 Prevention Plan

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The General Manager or appointee has overall authority and responsibility for implementing the provisions of this CPP in our workplace. In addition, all managers and supervisors are responsible for implementing and maintaining the CPP in their assigned work areas and for ensuring employees receive answers to questions about the program in a language they understand. All employees are responsible for using safe work practices, following all directives, policies and procedures, and assisting in maintaining a safe work environment.

Project Description: This CPP is designed to control exposures to the SARS-CoV-2 virus that may occur in our workplace. This CPP lives within the Codes of Safe Work Practices in the Injury and Illness Prevention Program (IIPP).

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Injury and Illness Prevention Planning

Responsible Agency/ Department/Partners: NID

Cost Estimate: Various

Benefits (Losses Avoided): Employee and Agency health and resiliency

Potential Funding: NID - Grants

Timeline: Currently in place

Project Priority (H, M, L): H

Action 8. Dam Failure Mitigation

Hazards Addressed: Dam Failure

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: A dam failure can range from a small uncontrolled release to a catastrophic failure, caused by prolonged rainfall and flooding. The primary danger associated with dam failure is the high velocity flooding of those properties downstream of the dam. Dam failure flooding varies by area depending on which dam fails and the nature and extent of the dam failure and associated flooding. The district's highest dam is the rock fill-earth core dam at Rollins Reservoir, built in 1965 and standing 242 feet tall. The Jackson Meadows dam (1965) is second highest at 195 feet, Scotts Flat dam (1965) is 175 feet, and the Bowman South Arch dam (1925) is 171 feet high. French Dam, constructed in 1858-59, is the district's oldest dam still in use. Based on analysis provided in the Placer County General Plan Background Report, only five dams within Placer County have the potential to affect more than 100 persons: Folsom Dikes No. 5 & 6; Lake Tahoe Dam; Camp Far West Dam; Lake Combie Dam; and Rollins Reservoir Dam. Of these five, a failure of Rollins Reservoir or Combie Dams could potentially impact areas within the NID. Failure of Dutch Flat Forebay could also potentially impact services provided by NID, albeit in a limited capacity.

Project Description: Van Giesen Dam (Combie Lake) Stabilization and Scour Protection – Construct improvements necessary to stabilize dam and protect against scour during extreme flood events. Combie South Powerhouse Access Improvements – Construct improved access to powerhouse for safety and security.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Dam EAPs

Responsible Agency/ Department/Partners: Nevada Irrigation District, California Department of Water Resources Division of Safety of Dams, and Federal Energy Regulatory Commission.

Cost Estimate:

- Dam Improvements: \$13,287,000
- Road Improvements: \$150,000

Benefits (Losses Avoided): Loss of life in the event of a dam failure.

Potential Funding: CA DWR, Cal OES, FEMA, and other grant funding sources.

Timeline: When funding is available

Project Priority (H, M, L): Medium

Action 9. Water Conservation and Drought Preparedness

Hazards Addressed: Drought & Water Storage

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The impact of a drought on the District is primarily one of water supply. Most water provided by the NID comes from snowmelt from the high mountain watershed. A multiple year drought can severely compromise the water supply within the district. The District experienced below average

precipitation and minimal snowpack from 2012 to 2015 and again from 2017 to 2020. Current precipitation conditions are below average as well. In 2014 the District recorded a snowpack reading of 5% of average, the lowest snowpack reading since it began collecting this data in 1921. Governor Brown declared a state of emergency and the State Water Resources Control Board restricted water use and curtailed many of the Districts water rights. The limited water supply along with the States mandated actions necessitated the enactment of the Districts Drought Contingency Plan. Some of the action items from the plan include: limiting and or suspending additional Ag water sales, mandatory treated water reductions, and the establishment of a water waste reporting program. The District has proactively managed its water resources in preparation for additional dry years. In addition to conservative water management, the District also purchased supplemental waters from neighboring agencies to help bolster water supply. After 2 years of below-average rainfall and very low snow-melt run off, Governor Schwarzenegger in June of 2008 declared a state of emergency for drought conditions statewide. The final California Department of Water Resources showed snowpack water content at only 67 percent of normal. The 1991-1992, drought also severely impacted the District and other areas of Placer County and surrounding California foothills. A severe drought that affected the District and all of California is the drought of 1977-1978. This drought was severe enough to trigger implementation of the District's Drought Contingency Plan at the most restrictive level – that of mandatory rationing and reduction in service to irrigation customers up to 50%. With the unknowns of drought and globally changing climate conditions, NID, more than ever, is promoting water conservation and expansion of liquid storage. In addition to water storage concerns, prolonged drought is contributing to the success of forest pests, such as the pine bark beetle, which is leading to heightened levels of tree mortality. These high levels of mortality are costly to mitigate, and pose a serious risk to facilities and visitors to NID-owned campgrounds.

Project Description: NID prioritizes projects to increase water system efficiency, and also to make forested watersheds more resilient to drought. Reduce understory and selectively thin forested watershed lands to increase surface runoff, snowpack accumulation and reduce loss through evapotranspiration. Reducing competition in forest stands can help increase the resiliency of remaining trees to disturbances such as drought. Invest in enhancement of wet meadow environments on open watershed lands to provide late summer flows, attenuate runoff, and reduce evaporative loss.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Draft District Forest Management Plan, English Meadow Forest Management Plan, CABY IRWM Project List

Responsible Agency/ Department/Partners: Nevada Irrigation District; CABY

Cost Estimate: \$5 million

Benefits (Losses Avoided): Increase water availability via thinning of overstocked forest stands in addition to reduced loss from evapotranspiration. Decreased mortality in well-managed tree stands with healthy forest conditions.

Potential Funding: CAL FIRE, Sierra Nevada Conservancy, CABY IRWM Grants

Timeline: Annual

Project Priority (H, M, L): H

Action 10. Drought Contingency Plan

Hazards Addressed: Drought, Climate Change

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The mandatory reduction measures implemented through this plan are designed to preserve minimal supplies for public health and safety. Mandatory reduction stages will trigger the formation of the Drought Hardship Committee whose purpose is to review hardship applications and determine whether additional water can be provided to the applicants with an economic hardship and/ or those utilizing best management practices.

Project Description: The purpose of the Nevada Irrigation District's Drought Contingency (Plan) is to provide guidance to staff and customers to help minimize drought or water supply shortage impacts. The plan identifies drought action levels, appropriate agency responses, water demand reduction goals, and provides recommended demand management measures to assist customers in water conservation.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: NID Drought Contingency Plan

Responsible Agency/ Department/Partners: NID

Cost Estimate: Various

Benefits (Losses Avoided): See Plan

Potential Funding: NID - Grants

Timeline: Current

Project Priority (H, M, L): H

Action 11. Flood Mitigation

Hazards Addressed: Flood, Localized Flood, Heavy Rains and Storms

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: Flooding and soil erosion due to heavy rains and snow runoff have been a historical problem throughout Placer County. Abundant snowfall in the mountains combined with rain and steep terrain can mean rapid runoff and flooding. Water flow can be high in peak runoff periods with historical downstream flooding. The primary impacts from flooding within the district include damage to roads, utilities, bridges; and flooding of homes, businesses and critical facilities. Flooding has also caused canals

to overtop and erosion of the canal levees. The most recent flood event to impact the District is the late December floods of 2005. Excessive rain for a prolonged period caused severe flooding in the Sierra foothills, in and around Placer County. Impacts included damage to the District's canal system as well as damage to roads and properties throughout District boundaries. Heavy prolonged precipitation in late 1996 caused flood damage across much of the District's service area. President Clinton proclaimed the area a disaster area while Governor Wilson followed suit. Many of the District's main diversion dams and canals were washed out. Over 50 applications for flood damage assistance for the repair of NID facilities were submitted to FEMA and Cal OES.

Project Description: Improvement of District remote sensing equipment, Supervisory Control and Data Acquisition (SCADA) system, and communication network. Components include software upgrades, hardware upgrades, and new communication tower construction.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Agency/ Department/Partners: Nevada Irrigation District

Cost Estimate: \$750,000.

Benefits (Losses Avoided): Improved forecasting, real time monitoring field conditions.

Potential Funding: CAL OES, FEMA, CA DWR Grants

Timeline: Within 5 years

Project Priority (H, M, L): Medium

Action 12. Healthy Forest Management and Wildfire Mitigation Plan

Hazards Addressed: Tree Mortality, Wildfire, High Winds

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: NID owns nearly 6,000 acres of forested land, generally located in borders around storage reservoirs and in scattered parcels where District infrastructure is located. Strategic forest management is therefore necessary for the District and those that rely on its water supply for the protection of source water, the water system, ecosystem values, and human health and property. The past 30 years of reduced logging and over a century of suppressing the frequent, low to moderate-intensity fire cycles with which local forest communities evolved, has led to overcrowded forest conditions that are at-risk of unnaturally severe wildfire (CAL FIRE). Significant competition for resources such as water and sunlight place stress on individual trees and forest communities and decrease the ability of the forest to defend itself from pests and diseases. This accumulation of understory vegetation, coupled with increased stress and pest presence can lead to significant tree mortality; further exaggerating the issue of extreme wildfire risk. When

the ignition risk associated with WUI residents and the campgrounds that NID owns is factored in, the potential for a catastrophic wildfire becomes very high.

Project Description: The goals of the District’s Watershed Program are:

“The protection of residents, visitors, and District infrastructure from wildfire and hazard trees” and “the protection and improvement of District forest land for the health of the watershed and associated ecosystem services, including water supply, recreation, soil retention, and carbon sequestration.”

This plan is intended to provide management guidelines that include: an overview of the District’s forest land, forest issues, program objectives and action items, and supporting information. The priority objectives of the District’s forestry program involve significantly reducing the risk of wildfire ignition and hazardous trees around storage reservoirs, hydroelectric and treatment facilities, water conveyance infrastructure and within recreation areas, where risks to human health and safety, water supply, and system operation are highest.

This plan is intended to inform and support District staff as they plan and implement forest and vegetation management projects. It provides context and related literature to support increased understanding by staff that will utilize these recommendations and Managers and District Board Members who will oversee our programs and set direction as we move forward. This plan also can be shared with partners at Nevada County, Consolidated Fire, CAL FIRE, and other local organizations that are working towards our collective goals for safer communities, reduced wildfire risk and severity, and long-term water resource protection.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: This action creates a planning mechanism.

Responsible Agency/ Department/Partners: NID

Cost Estimate: To be determined

Benefits (Losses Avoided): Reduced wildfire risk to people and property.

Potential Funding: NID - Grants

Timeline: Within 5 years

Project Priority (H, M, L): H

Action 13. Forest Resilience Program

Hazards Addressed: Climate Change

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: Climate models predict that the Sierra Nevada Region will experience warming average annual temperatures ranging from an increase of 2°F - 4°F in the winter and 4°F - 8°F in the summer by the end of the century. This shift to a warmer climate is expected to have wide ranging effects on the annual weather conditions, snowfall, forest health, water availability, and wildfire. One of the most concerning impacts of climate change on the District is reduced forest resilience and the projected decrease in annual snowpack accumulation due to the transition of average annual precipitation from snow to rain caused by increasing temperatures. As a headwaters region, snowpack is the largest source of storage within the NID system, and the series of reservoirs rely heavily on the timed release of water in snowpack to recharge reservoirs into the late summer when rain no longer falls. Actively managing forested landscapes can help NID address climate change impacts, prepare for the future, and reduce risks (such as severe wildfire) that are exacerbated by a warmer climate.

Project Description: Forest thinning and selective harvest projects to reduce forest stand density and accumulated fire fuels, thereby reducing risk of extreme and carbon intensive wildfire. Understory thinning also decreases stress in the residual stand, leading to increased carbon sequestration rates, less liquid water loss to evapotranspiration, and increased pest resistance. Creating areas where snowfall can reach to the forest floor promotes prolonged snowpack and increased accumulation greater than areas where dense vegetation prevents optimal snowpack.

Other Alternatives: Carbon emission reduction strategies

Existing Planning Mechanism(s) through which Action Will Be Implemented: Draft District Forest Management Plan

Responsible Agency/ Department/Partners: Nevada Irrigation District

Cost Estimate: Forest Thinning: \$2,000 - \$3,000 per acre

Benefits (Losses Avoided): Increased snowpack accumulation, increased carbon sequestration rates, increased water availability, increased habitat resilience to possible disturbance, decreased risk of wildfire

Potential Funding: Sierra Nevada Conservancy, CAL FIRE, Wildlife Conservation Board.

Timeline: Annual

Project Priority (H, M, L): H

Action 14. Injury and Illness Prevention Program

Hazards Addressed: Pandemic

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: A collectively involved and consulted workforce contributes to a work environment where health and safety are core values. NID has a basic responsibility to make the safety of employees a primary objective; at the same time, workers have a right to work in places where all risks to their health

and safety are properly controlled. The successful operation of the District depends not only on service to the public, but also how safely each job is performed.

Project Description: It is the policy of the Nevada Irrigation District to provide a safe and healthful work environment for all of its employees – an environment that is absent of recognized hazards that may cause, death or serious physical harm to its employees. In an effort to achieve this goal, the District maintains an Injury and Illness Prevention Program that conforms to the best safe practices.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Covid 19 Prevention Planning

Responsible Agency/ Department/Partners: NID

Cost Estimate: To be determined.

Benefits (Losses Avoided): Reduced risk to staff.

Potential Funding: NID - Grants

Timeline: Ongoing

Project Priority (H, M, L): Medium

Action 15. Public Safety Plan (FERC)

Hazards Addressed: Climate Change, Drought & Water Storage, Earthquake, Flood, Landslides, Severe Weather, Tree Mortality, Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: This Public Safety Plan complies with FERC’s Guidelines for Public Safety at Hydropower Projects, dated March 1992 and updated November 29, 2011.

The purpose of the Public Safety Plan is to describe the hazards that exist at or near hydropower facilities and operations, and the safety devices or other measures that are employed to enhance the protection of the public that utilize the Nevada Irrigation District’s (NID) Yuba-Bear, Scotts Flat, and Combie Hydroelectric Projects (Projects) land and water. The Federal Energy Regulatory Commission (FERC) is primarily concerned with the hazards created by Project structures and operations. However, hazards created by natural conditions in Project waters and at recreational areas operated or leased by licensees of hydropower projects are equally important.

Project Description: The Projects are a series of dams, reservoirs, forebays, afterbays, tunnels, pipelines, conduits, powerhouses, transmission lines, roads, and structures needed to operate and maintain the District’s facilities. The purpose of the Projects is to store and provide water for irrigation and domestic use and to generate electrical power as a secondary use.

Because the dams, reservoirs, roads and other features are located in a mountainous area that has great attraction for recreation, these Project facilities also serve as recreational facilities. However, the primary purpose of each of these facilities is to supply water to downstream users. Thus, while the primary purpose is to provide water and power, recreational use of the facilities is an important part of operations, and great effort is put into making this use as safe as possible while still meeting Project goals and commitments.

NID is committed to public safety. The District will continue to regularly review their current operating procedures, and where applicable and practical, modify them to improve safety within the Projects.

Other Alternatives: No action.

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Agency/ Department/Partners: Nevada Irrigation District

Cost Estimate: To be determined.

Benefits (Losses Avoided): Identifies hazards near hydropower facilities and operations. Describes safety devices and safety measures. Describes operational controls and inspection and maintenance. Regulatory compliance.

Potential Funding: NID or Grants

Timeline: On-going

Project Priority (H, M, L): Medium

Action 16. North Auburn Treatment Plant VFD's and Permanent Backup Generator

Hazards Addressed: Water Supply Reliability, Wildfire, Earthquake Vulnerability

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The North Auburn Treatment Plant has been impacted by loss of power by PSPS events as well as wildfires. The need is to install a permanent backup generator to allow the treatment plant to continue to operate and supply treated water and fire hydrants within the North Auburn service area.

Project Description: Replace the high-lift pumps motor control center, install VFD's and a permanent natural gas driven backup generator that can run the water treatment plant.

Other Alternatives: No other financially feasible option exists.

Existing Planning Mechanism(s) through which Action Will Be Implemented: The District is currently in design of the improvements. Construction scheduled to be completed in 2022.

Responsible Agency/ Department/Partners: Nevada Irrigation District

Cost Estimate: Approximately \$600,000.

Benefits (Losses Avoided): Reduces/eliminates potential loss of treated water supply to the entire North Auburn Treatment Plant Service area.

Potential Funding: District Capital

Timeline: Will be finished in 2022

Project Priority (H, M, L): High

Action 17. Orr Creek Diversion

Hazards Addressed: Water Supply Reliability, Flood Control

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The Districts Orr Creek Diversion Structure was built in the early 1900's and has gone through a number of modifications and additions. The older portion of the structure is leaking and needs replacement. The proposed project would strengthen the diversion dam to guard against failure, repair leakage under the dam, and provide a discharge valve to allow for flow control below the dam. This facility is the lifeline to hundreds of acres of irrigated lands in Placer County. District is currently working on a District wide reservoir storage study that will help guide the District in developing strategies regarding existing reservoirs.

Project Description: Upgrade/Improve/Replace existing diversion structure or bypass around the facility and abandon.

Other Alternatives: Leave the facility as is or move the diversion to a different location.

Existing Planning Mechanism(s) through which Action Will Be Implemented: The District has included the Orr Creek Diversion in its capital improvement plan and is part of the District wide reservoir storage study currently being completed.

Responsible Agency/ Department/Partners: Nevada Irrigation District Engineering Department

Cost Estimate: \$2,000,000

Benefits (Losses Avoided): The retrofit of the facility would provide the structural integrity to minimize potential dam failure. The project will provide water supply reliability to the many customers who receive water from this diversion structure. The installation of an outlet valve will allow the District to better control the waters that flow past the facility particularly during heavy precipitation events. Abandoning of the structure and constructing a new diversion upstream that would be better suited to handle flood events.

Potential Funding: District Funding, Grants

Timeline: 3 to 5 years

Project Priority (H, M, L): Medium priority. Project will progress as funding becomes available

Action 18. *Owner's Dam Safety Program, Revision 3.0*

Hazards Addressed: Climate Change, Drought and Water Storage, Earthquake, Flood, Landslides, Mudslides, Sever Weather, Wildfire, Tree Mortality

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: NID owns, operates, and maintains dams and the associated appurtenant works. Under normal circumstances, these assets produce hydroelectric power and water for consumptive and irrigation uses. Under adverse conditions, such as those related to hydrologic, geologic, and seismic hazards, these assets may pose a risk to lives and property. It is the objective of NID to mitigate these risks and maintain the long-term safe and reliable operation of these assets. It is the policy of NID to continue the safe operations of the dam inventory and associated appurtenant works, while maintaining compliance with all applicable laws and regulations.

The purpose of the Owner's Dam Safety Program (ODSP) is to manage the safety of the District dams and their ancillary facilities for the protection of life, property, and the environment. The ODSP is intended to ensure that NID's Board of Directors, Management, Chief Dam Safety Coordinator (CDSC), Dam Safety Engineer (DSE), dam operational, maintenance, and engineering staff, consultants, construction contractors, and other agents have a good understanding and constant awareness of the on-going need to watch for and improve the safety of the dams to ensure the safety of the public.

Project Description: This ODSP is applied to all the District Dams and the ancillary facilities under the jurisdiction of Federal Energy Regulatory Commission (FERC) or California Division of Safety of Dams (DSOD). These include FERC's Yuba-Bear Project (P-2266), Combie Dam Project (P-2981), Scotts Flat Dam Project (P-5930), and Loma Rica and Deer Creek Diversion Dams (both are DSOD jurisdiction only). The ODSP also applies to the spillways, penstocks, outlet structures, instruments, reservoirs, and stream beds associated with the dams.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Agency/ Department/Partners: Nevada Irrigation District

Cost Estimate: To be determined.

Benefits (Losses Avoided): Mechanism to comply with regulatory standards. Mitigate risks to lives and property related to hydrologic, geologic, and seismic hazards associated with dams.

Potential Funding: NID or Grants

Timeline: On-going

Project Priority (H, M, L): Medium

Action 19. Raw Water Master Plan

Hazards Addressed: Drought, Climate Change, Flood, Severe Weather

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The Nevada Irrigation District’s Plan for Water was last updated in 2005 and adopted in 2013. The plan helps guide decisions related to the water system over the next 50 years. Long range planning ultimately involves forecasting & projecting future conditions based on realistic, valid and supportive assumptions. Regardless of the technology, science, or process used, assumptions still must be made to produce a forecast.

Project Description: The District is updating the plan to reflect changes in water demand, supply and the potential effects of climate change. The plan is an organizational tool that seeks to align resource decision making with community values and District operational needs, including technical and cost criteria requirements. When complete the plan will show how a variety of future water supply and demand scenarios could be integrated to ensure our community enjoys the same high-quality, reliable water system we have now. The Plan for Water is born of the FERC relicensing effort, climate change impacts, financial requirements, and new regulatory requirements. The Plan for Water does not re-analyze or revisit any new requirements set by FERC or the State. Instead, it sets these requirements as the new normal, and looks ahead 50 years to anticipate potential supply/demand scenarios and identify alternative solutions

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Raw Water Master Plan 2011, 2015 Agricultural Water Management Plan – Updated in 2021, 2015 Urban Water Management Plan – Updated in 2021

Responsible Agency/ Department/Partners: NID

Cost Estimate: Various

Benefits (Losses Avoided): Reduced risk to drought and water shortage.

Potential Funding: NID - Grants

Timeline: Continuous

Project Priority (H, M, L): Medium

Action 20. Raw Water Replacement Program

Hazards Addressed: Water Supply Reliability, Flood Control, Levee Failure, Drought and Water Shortage

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: There are raw water facilities (canals) throughout the Placer County area. These canals are often aged, leaking or undersized. During heavy rain events these canals can backup water causing flooding and overtopping of the canal. Leaking and overtopping often results in erosion of the canal berm and presents possible property damage. Leaking canals also can exasperate water shortages during drought. Nevada Irrigation District is currently engaged in a raw water replacement program that is budgeted annual and aimed at resolving these issues.

Project Description: Encasement and lining of District canals and replacement/upgrades of existing canal structures/pipelines.

Other Alternatives:

Existing Planning Mechanism(s) through which Action Will Be Implemented: The Nevada Irrigation Districts Engineering Department and Maintenance Department provides oversight on these projects.

Responsible Agency/ Department/Partners: Nevada Irrigation District

Cost Estimate: Minimum of \$1,000,000 annually. Budgets for this program varies per year based on projects identified.

Benefits (Losses Avoided): Life, Safety, Localized Flooding, Reduction in loss of private property, improved efficiency of water supply deliveries

Potential Funding: District funding, grants

Timeline: Ongoing

Project Priority (H, M, L): Medium

Action 21. Reservoir Cleaning

Hazards Addressed: Water Supply Reliability, Flood Control

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: Large onstream reservoirs and small reservoirs located within the canal system are filling with sediment from continued years of use. Adequate reservoir storage is very beneficial during storms and heavy rain. As the reservoir accumulates sediment, water storage is reduced and the ability to regulate water efficiency is diminished. Reduced reservoir storage in the small reservoirs can result in upstream canal overtopping and property damage. District is currently working on a District wide reservoir storage study that will help guide the District in developing strategies regarding this complex issue.

Project Description: Removal of sediment with existing District reservoirs.

Other Alternatives: Watershed mitigation, sediment basins

Existing Planning Mechanism(s) through which Action Will Be Implemented: The Nevada Irrigation Districts Engineering and Maintenance Departments provide oversight on these projects.

Responsible Agency/ Department/Partners: Nevada Irrigation District

Cost Estimate: Removal of sediment in District reservoirs would exceed \$150,000,000

Benefits (Losses Avoided): Water Quality, Water storage and prevention of property damage

Potential Funding: District Funding, Grants

Timeline: Ongoing

Project Priority (H, M, L): Medium

Action 22. Resilient Headwaters Forests

Hazards Addressed: Severe Weather Extreme Heat

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: Extreme heat events are closely related to drought, climate change, and tree mortality when it comes to impacts to District operations. Extreme heat events can range in severity and duration, leading to varying increases in water demand/use along with hazardous work conditions for employees who work outdoors to maintain District function. Extreme heat events typically occur at lower elevations in western Nevada County and can last for short or long periods of time, though climate change may create variations to these conditions that push the reach of affected areas higher in elevation for a longer duration. Extreme heat events can have fatal effects on native vegetation and trees, leading to stress, partial/complete failure, or increased mortality. Extreme heat events have the potential to cause earlier melt off of snowpack, should these events occur earlier in the summer, leading to water availability issues in the late summer when resources are needed most.

Project Description: Removal of hazardous trees with potential to strike District Facilities or recreational visitors to campgrounds based on their potential to fail during extreme heat events

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Agency/ Department/Partners: Nevada Irrigation District

Cost Estimate: \$500 - \$8,000 per tree removed depending on location, size, and disposal

Benefits (Losses Avoided): Reduced likelihood of loss of life and property due to trees or parts of trees falling due to extreme heat events.

Potential Funding: Nevada Irrigation District; Hazard Tree Removal Grants

Timeline: Annual

Project Priority (H, M, L): High

Action 23. Tree Mortality Mitigation

Hazards Addressed: Tree Mortality

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Drought and pest related tree mortality is a serious issue facing the District and the Sierra Nevada Region of California. Prolonged drought is leading to an increase of forest pests and diseases that are targeting trees stressed by drought; leading to widespread and above average levels of tree mortality. Increased tree mortality is a threat to district facilities and infrastructure as standing dead trees have a higher potential to fall and damage infrastructure. Dead and dying trees also pose a significant fire risk as dead and dry vegetative material acts as prime fire fuel. Governor Brown declared a state of emergency in 2014 due to the unprecedented level of tree mortality in California, stating that there were 22 million dead trees in 2014 throughout California with tens of millions expected to die by the end of the year. Part of the state of emergency declared that agencies, utilities and local governments shall undertake efforts remove dead and dying trees in high hazard zones. The Tree Mortality Task force, comprised of state and federal agencies, local governments and stakeholders determined in 2017 that Placer county and the Tahoe National Forest were high priority areas based on their high tree mortality (Placer: 774,000 trees from 2010-2016; Tahoe; 718,000 from 2010 – 2016)

Project Description: Annually assess and remove as necessary standing dead, dying and diseased trees with potential to strike district infrastructure, visitors, or structures adjacent to district owned property in the event of failure. Removed downed woody debris where feasible and accessible to reduce wildfire threat and spread of fatal tree diseases. Thin understory vegetation and selectively harvest open watershed lands to increase health and potential success of residual trees and remove trees who have become a host to forest pests with potential for mortality or spread of pest species.

Other Alternatives:

Existing Planning Mechanism(s) through which Action Will Be Implemented: Draft District Forest Management Plan, English Meadow Forest Management Plan

Responsible Agency/ Department/Partners: Nevada Irrigation District, CAL FIRE, Sierra Nevada Conservancy, Wildlife Conservation Board, US Forest Service

Cost Estimate: \$100,000 annually

Benefits (Losses Avoided): Reduced loss of District infrastructure, life and property due to damage caused by falling trees. Reduced loss of healthy trees to increased tree mortality by increasing health and the trees ability to fight off pests. Remove excessive fire fuels which threaten existing life healthy trees

Potential Funding: CAL FIRE, Sierra Nevada Conservancy, CABY

Timeline: Annual

Project Priority (H, M, L): H

Action 24. 2015 Urban Water Management Plan – Updated 2021

Hazards Addressed: Climate Change, Drought

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The Urban Water Management Planning Act requires every urban water supplier providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually to adopt and submit a UWMP every five years to the California Department of Water Resources (DWR). The Act describes the contents of the UWMP as well as how urban water suppliers should adopt and implement the UWMP.

Project Description: This UWMP addresses the District’s water system and includes a description of the service area, water use, water supply sources, and a comparison of water supply and water demands during normal, single dry, and multiple-dry years. Also described is the District’s water conservation program. This UWMP is the year 2015 UWMP as required by the Urban Water Management Planning Act of 1983 (Act). The Act is described in California Water Code Division 6, Part 2.6, Sections 10610 through 10657.

Other Alternatives: No action.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Plan For Water – Raw Water Master Plan

Responsible Agency/ Department/Partners: NID

Cost Estimate: Various

Benefits (Losses Avoided): See Plan

Potential Funding: NID - Grants

Timeline: Continuous

Project Priority (H, M, L): Medium

Action 25. Vegetation Management Plan (Hydroelectric Facilities)

Hazards Addressed: Climate Change, Wildfire, Tree Mortality

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: This Hydroelectric Facilities Vegetation Management Plan (“VMP”) addresses vegetation modification guidelines and best practices to minimize wildfire risk associated with the District’s

powerhouses and related transmission lines, penstocks, and flumes located within the District's boundary in both Nevada County and Placer County, California. The VMP has been developed to identify best management practices for vegetation management methods and applications for the District's seven (7) powerhouses and their associated transmission lines, penstocks, and canals/flumes. The VMP was also developed with the inclusion of invasive weed management, revegetation, and human and resource protection measures as appropriate.

Project Description: The purpose of the VMP is to provide fire prevention procedures, reporting, and safe fire avoidance and suppression practices for District personnel and contractors responsible for operating and maintaining the existing District hydroelectric facilities. A primary purpose of the VMP is to establish procedures and protocols for management of native vegetation and treatment of invasive weeds in order to maintain a desirable environmental condition that is consistent with the safe and effective operation and maintenance (O&M) of District hydroelectric facilities. The VMP contains descriptions of specific vegetation management actions, including treatment of invasive weeds, which the District will use to achieve desired conditions in and around project-related transmission corridors, hydroelectric facilities, and access roads that are associated with each of the District's seven powerhouses. The vegetation management strategies outlined in the VMP describe how the District will achieve a variety of desired conditions, dependent on the type of site, from bare ground (powerhouses and switchyards) to compatible native vegetation communities (penstocks and transmission corridors).

Other Alternatives: No action.

Existing Planning Mechanism(s) through which Action Will Be Implemented: This will create a planning mechanism.

Responsible Agency/ Department/Partners: Nevada Irrigation District

Cost Estimate: To be determined.

Benefits (Losses Avoided):

- Fire prevention procedures
- Reporting
- Safe fire avoidance and suppression practices
- Resource protection
- Reduce risk of fire
- FERC license and regulatory compliance
- Vegetation control

Potential Funding: NID or Grants

Timeline: On-going

Project Priority (H, M, L): Medium

Action 26. Water Planning Projections

Hazards Addressed: Drought, Climate Change

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The need to update NID’s Water Planning Projections is driven by a series of requirements and assumptions, including the new Yuba-Bear System Federal Energy Regulatory Commission (FERC) regulatory requirements, state-derived climate change data, and the state-mandated planning requirements. Together, these requirements and assumptions constitute significantly new planning assumptions and drive the need to update and revise NID’s Water Planning Projections when necessary.

Project Description: The Water Planning Projections consists of three studies that analyze the hydrology, water supply and water demand that help NID determine if its water storage and delivery system will provide sufficient water to meet customer demands over time and under variable conditions. The Water Planning Projections are used to prepare a number of planning reports such as the Urban Water Management Plan and the Agricultural Management Plan required to be updated and submitted to the State of California every five years. The Water Planning Projections is also used to prepare the District’s Plan for Water, formerly called a Raw Water Master Plan, and is considered when making decisions about capital improvements to its water storage and delivery system.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: No existing mechanisms.

Responsible Agency/ Department/Partners: NID

Cost Estimate: Various

Benefits (Losses Avoided): See Projections

Potential Funding: NID - Grants

Timeline: Continuous

Project Priority (H, M, L): Medium

Action 27. Water Service Auburn Valley CSD

Hazards Addressed: Water Supply Reliability

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The Auburn Valley CSD is a small subdivision on the north end of Placer County. The water supplied to the subdivision is accomplished through a number of ground water wells. Current

drought conditions have exposed some well yield issues that have affected the available water supply to the area.

The District has the potential to supply the subdivision with treated surface water from either its North Auburn or Lake of the Pines water systems. Both connection points would take a substantial amount of infrastructure in pipelines to connect. Regardless, should the Auburn Valley CSD's wells go dry, an alternative water supply will be needed in short order.

Project Description: Installation of treated water pipeline to serve community from the District's North Auburn WTP.

Other Alternatives: Auburn Valley could drill more wells or purchase surface water from NID and treat onsite

Existing Planning Mechanism(s) through which Action Will Be Implemented: Auburn Valley is not within NID's service boundary; however efforts to include them are already underway. Once inside, the District would have the opportunity to provide water, be it treated or raw. The project would be handled by the Nevada Irrigation Districts Engineering Department.

Responsible Agency/ Department/Partners: Nevada Irrigation District / Auburn Valley CSD

Cost Estimate: \$1.5 Million to connect to the Districts treated water system.

Benefits (Losses Avoided): Reliable water supply to a vulnerable system. This would alleviate a potential public health and safety issue should the CSD run out of water.

Potential Funding: Grants, Private Funding

Timeline: 3 to 5 years

Project Priority (H, M, L): Currently medium priority as the District works to include the area within its boundaries.

Action 28. Forest Resilience and Wildfire Risk Reduction

Hazards Addressed: Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: All communities within the northwestern portion of Placer County served by the NID are listed on the National Fire Plan's "Communities at Risk" list as set forth in Section 4.3.2 of the main plan. Over one hundred years of aggressive fire suppression under the national fire suppression policy has rendered wildlands severely overgrown. Much of the private land in the District's area is in the wildland urban interface with increasing residential development. As more people move into the area and impacts from recreational demands increase, there will be more human-caused wildfire starts each year. And the increased number of widely scattered homes within the District adds greatly to the danger, complexity, and cost of fighting these fires. Forest overgrowth due to the efficiency of modern firefighting techniques, and

the vast acreages of land in need of understory thinning or selective harvest to decrease the fuel without natural fire is a serious problem. If wildfire does not impact the forest first, native insects and diseases which thrive in dense forest conditions may eventually kill millions of trees; further adding to the accumulated dead and dry fuels that would otherwise have been cleared out by low intensity fire. Explosions in insect populations usually start during a drought, when the lack of water combined with overcrowded forest conditions impact the trees' ability to reject the insects. Without a change in management practices on public lands, there is little hope of avoiding unusually high tree mortality experienced by other national forests. The size in acreage and the severity of wildfire in California is increasing. Five of the top twenty largest California wildfires occurred in 2020. The deadliest and most destructive of which was the Camp Fire which burned over 150,000 acres, 18,000 structures, and caused at least 85 fatalities in 2018. The massive scale of this wildfire had significant impacts to not only the public, but utility infrastructure as well. Costs of disaster related debris removal, emergency protective measures to protect life and property, and permanent repair to damaged or destroyed infrastructure, including repair and replacement of Paradise Irrigation District's water system features, reached more than \$129 million, The most notable recent wildfire to impact the District was the Jones Fire in 2020. The wind driven fire occurred in the South Yuba River canyon and burned over the Districts Newtown Canal. 21 structures and 705 acres were burned during the 12 day fire, having impacts to communities as well as infrastructure and the health of the landscape within the burn area.

Project Description: Reduce the density, and horizontal and vertical connectivity of fire fuels on District-owned property. Properly managed forest stand will be less likely to spark ignition, support an existing fire, or allow a less dangerous ground fire to reach the canopy where it will become a severe crown fire. Areas of high ignition potential, such as campgrounds, are prioritized for treatment along with important infrastructure and District and Private structures. Ongoing vegetation removal and control along the Bowman Transmission Line

Other Alternatives: Prescribed burning as a maintenance of desired condition.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Draft District Forest Management Plan

Responsible Agency/ Department/Partners: Nevada Irrigation District, CAL FIRE, Sierra Nevada Conservancy

Cost Estimate: \$2,000 - \$3,000 per acre for fuel reduction. \$100,000 annually for transmission line vegetation management.

Benefits (Losses Avoided): Infrastructure defense, maintenance of high water quality, avoidance of costly repair and replacement, protection of life and property.

Potential Funding: Nevada Irrigation District, CAL FIRE CFIP Grant, Sierra Nevada Conservancy,

Timeline: Reoccurring annually.

Project Priority (H, M, L): High

Annex K Newcastle Fire Protection District

K.1 Introduction

This Annex details the hazard mitigation planning elements specific to Newcastle FPD (District), a new participating jurisdiction to the 2021 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to the District, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

K.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table K-1. Additional details on plan participation and District representatives are included in Appendix A.

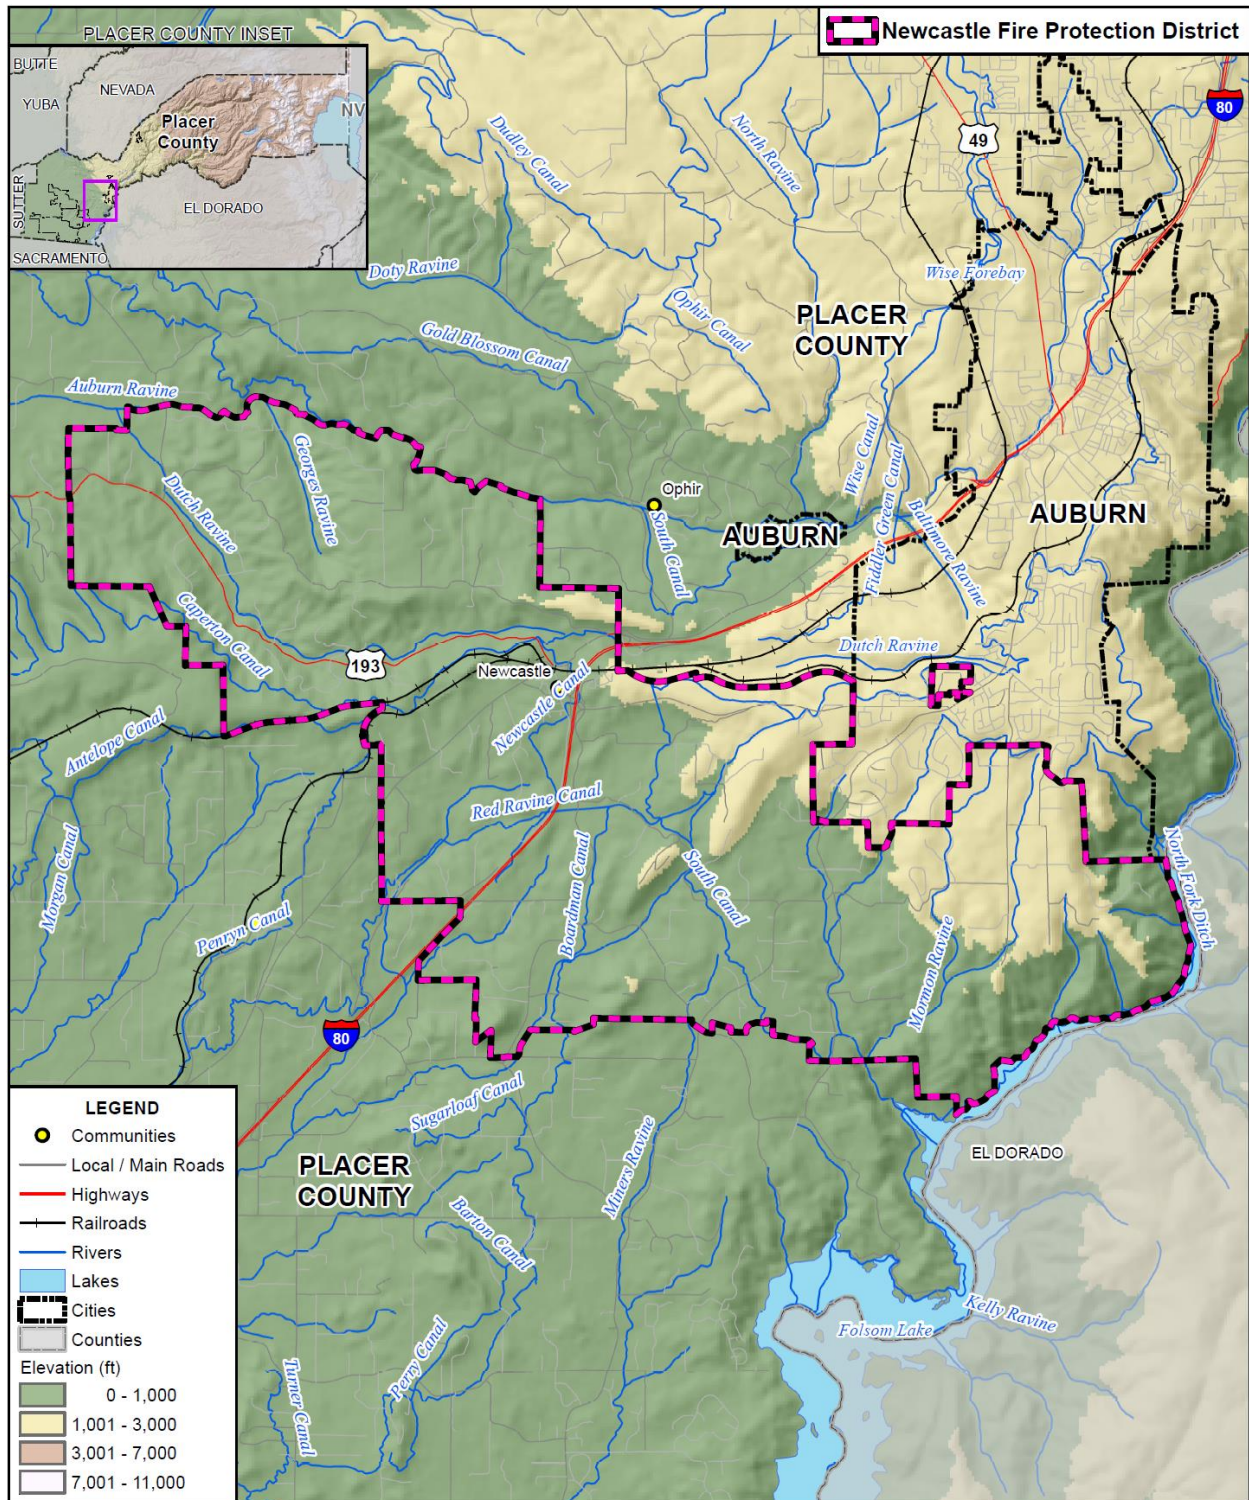

Table K-1 Newcastle FPD – Planning Team

Name	Position/Title	How Participated
Ian Gow	Fire Chief	Review and approval of information provided
Gillian Lofrano	District Manager	Provided data and information
Mark D'Ambrogi	Fire Marshal	Participated in meetings, completed required information

K.3 District Profile

The District profile for the Newcastle FPD is detailed in the following sections. Figure K-1 displays a map and the location of the District within Placer County.

Figure K-1 Newcastle FPD

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

K.3.1. Overview and Background

Newcastle Fire Protection District is located in the Sierra Foothills of Placer County, California. The District was established in 1868 and has been located in the same building since 1922 in the heart of the town of Newcastle. The District covers 15 square miles, serves approximately 6200 residents, and responds to approximately 700 calls for service annually.

The District is governed by a five member Board of Directors which is elected by voters of the District. The Fire Chief (currently shared with Placer Hills Fire Protection District) oversees 6 full time employees and 3-4 active volunteer firefighters.

The Newcastle Fire Protection District cross staffs both a Type 1 and Type 3 Wildland Interface Engine with a minimum staffing of two Personnel. Both personnel are trained to a minimum of EMT-1 with advanced scope of skills. One captain and one engineer are minimum staffing with intern, seasonal and volunteer personnel augmenting staffing to provide three personnel when possible. The District is an “All-Risk” department that provides a timely response to all types of fires, medical emergencies, rescues, and hazardous material incidents. Additional services include a year-round fire prevention program incorporating building occupancy inspections, new building plan reviews and an aggressive risk reduction and Public Education delivery model.

The District currently has two benefit assessments levied of which bring in \$340,358 and \$167,493 annually to help fund the District. A portion of these assessments are for capital expenditures mainly a new fire station.

The current fire station has been used since 1922 and does not meet the needs of an Essential Public Service Facility. The building no longer can support personnel, equipment, and public services in its current condition. The Board of Directors have been diligently planning relocation and construction of a new station.

Currently the Newcastle Fire Protection District has an agreement with Placer Hills Fire Protection District for Administrative Services that include: A Fire Chief, District Manager, Fire Marshal services, and Battalion Chief coverage.

K.4 Hazard Identification

Newcastle FPD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table K-2).

Table K-2 Newcastle FPD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Significant	Likely	Limited	Low	Medium
Avalanche	Limited	Unlikely	Limited	Low	Medium
Climate Change	Limited	Likely	Critical	Medium	–
Dam Failure	Limited	Unlikely	Limited	Low	Medium
Drought & Water Shortage	Extensive	Likely	Critical	High	High
Earthquake	Limited	Unlikely	Negligible	Low	Low
Floods: 1%/0.2% annual chance	Limited	Likely	Limited	Medium	Medium
Floods: Localized Stormwater	Limited	Likely	Critical	Medium	Medium
Landslides, Mudslides, and Debris Flows	Limited	Unlikely	Critical	Low	Medium
Levee Failure	Limited	Unlikely	Negligible	Low	Medium
Pandemic	Significant	Unlikely	Critical	Low	Medium
Seiche	Limited	Unlikely	Negligible	Low	Medium
Severe Weather: Extreme Heat	Extensive	Likely	Critical	Medium	High
Severe Weather: Freeze and Snow	Extensive	Unlikely	Critical	Medium	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Unlikely	Critical	Medium	Medium
Severe Weather: High Winds and Tornadoes	Limited	Unlikely	Limited	Low	Low
Tree Mortality	Limited	Likely	Limited	Medium	High
Wildfire	Extensive	Highly Likely	Catastrophic	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

K.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District's hazards and assess the District's vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

K.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section K.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table K-2) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

K.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District's total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the Newcastle FPD's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table K-3 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. Newcastle FPD’s physical assets, valued at over \$4 million, consist of the buildings and infrastructure to support the District’s operations.

Table K-3 Newcastle FPD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
Station 41	Essential	\$4,000,000	Wildfire/Earthquake
Total		\$4,000,000	

Source: Newcastle FPD

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. NFPD provides services to a number of resident types of which include retired individuals, a majority of the population, senior and elderly persons, working families that commute to school and work, and recreational enthusiasts utilizing natural resources in the area.

Natural Resources

Newcastle FPD has a variety of natural resources of value to the District. These natural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Historic and Cultural Resources

Newcastle FPD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan.

The District is in the process of relocating and constructing a new fire station to serve the existing response area, there will be no expansion of the current response area once the new station is built.

The District is also in the preliminary stages of providing Advanced Life Support (ALS) in the response area. ALS is an advanced level of emergency medical care that has been proven to save lives of the sick and injured.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. The District plans to continue the Administrative Services Agreement with Placer Hills FPD for Fire Chief, District Manager, Fire Marshal services, and Battalion Chief coverage. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

K.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table K-2 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Climate Change

Likelihood of Future Occurrence—Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Climate change adaptation is a key priority of the State of California. The 2018 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state’s infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Location and Extent

Climate change is a global phenomenon. It is expected to affect the whole of the District, Placer County, and State of California. There is no scale to measure the extent of climate change. Climate change exacerbates other hazards, such as drought, extreme heat, flooding, wildfire, and others. The speed of onset of climate change is very slow. The duration of climate change is not yet known, but is feared to be tens to hundreds of years.

Past Occurrences

Climate change has never been directly linked to any declared disasters. While the District noted that climate change is of concern, no specific impacts of climate change could be recalled. The District and HMPC members did, however, note that in Placer County, the strength of storms does seem to be increasing and the temperatures seem to be getting hotter. Hotter temperatures, combined with recent drought conditions, exacerbates the potential for damaging wildfires.

Vulnerability to and Impacts from Climate Change

The California Adaptation Planning Guide (APG) prepared by California OES and CNRA was developed to provide guidance and support for local governments and regional collaboratives to address the unavoidable consequences of climate change. California’s APG: Understanding Regional Characteristics has divided California into 11 different regions based on political boundaries, projected climate impacts, existing environmental setting, socioeconomic factors and regional designations. Placer County falls within the North Sierra Region characterized as a sparsely settled mountainous region where the region’s economy is primarily tourism-based. The region is rich in natural resources, biodiversity, and is the source for the majority of water used by the state. This information can be used to guide climate adaptation planning in the District and Placer County Planning Area.

The California APG: Understanding Regional Characteristics identified the following impacts specific to the North Sierra region in which the Placer County Planning Area is part of:

- Temperature increases
- Decreased precipitation

- Reduced snowpack
- Reduced tourism
- Ecosystem change
- Sensitive species stress
- Increased wildfire

Assets at Risk

The District noted that its facilities will most likely not be at risk from climate change.

Drought & Water Shortage

Likelihood of Future Occurrence–Likely

Vulnerability–High

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area’s usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table K-4.

Table K-4 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

Impacts that may affect the District due to drought are the increased risks of wildfire due to reduced fuel moistures and reduction of water sources for firefighting activities.

Assets at Risk

No District assets (from Table K-3) are at risk from this hazard.

Flood: 1%/0.2% Annual Chance

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

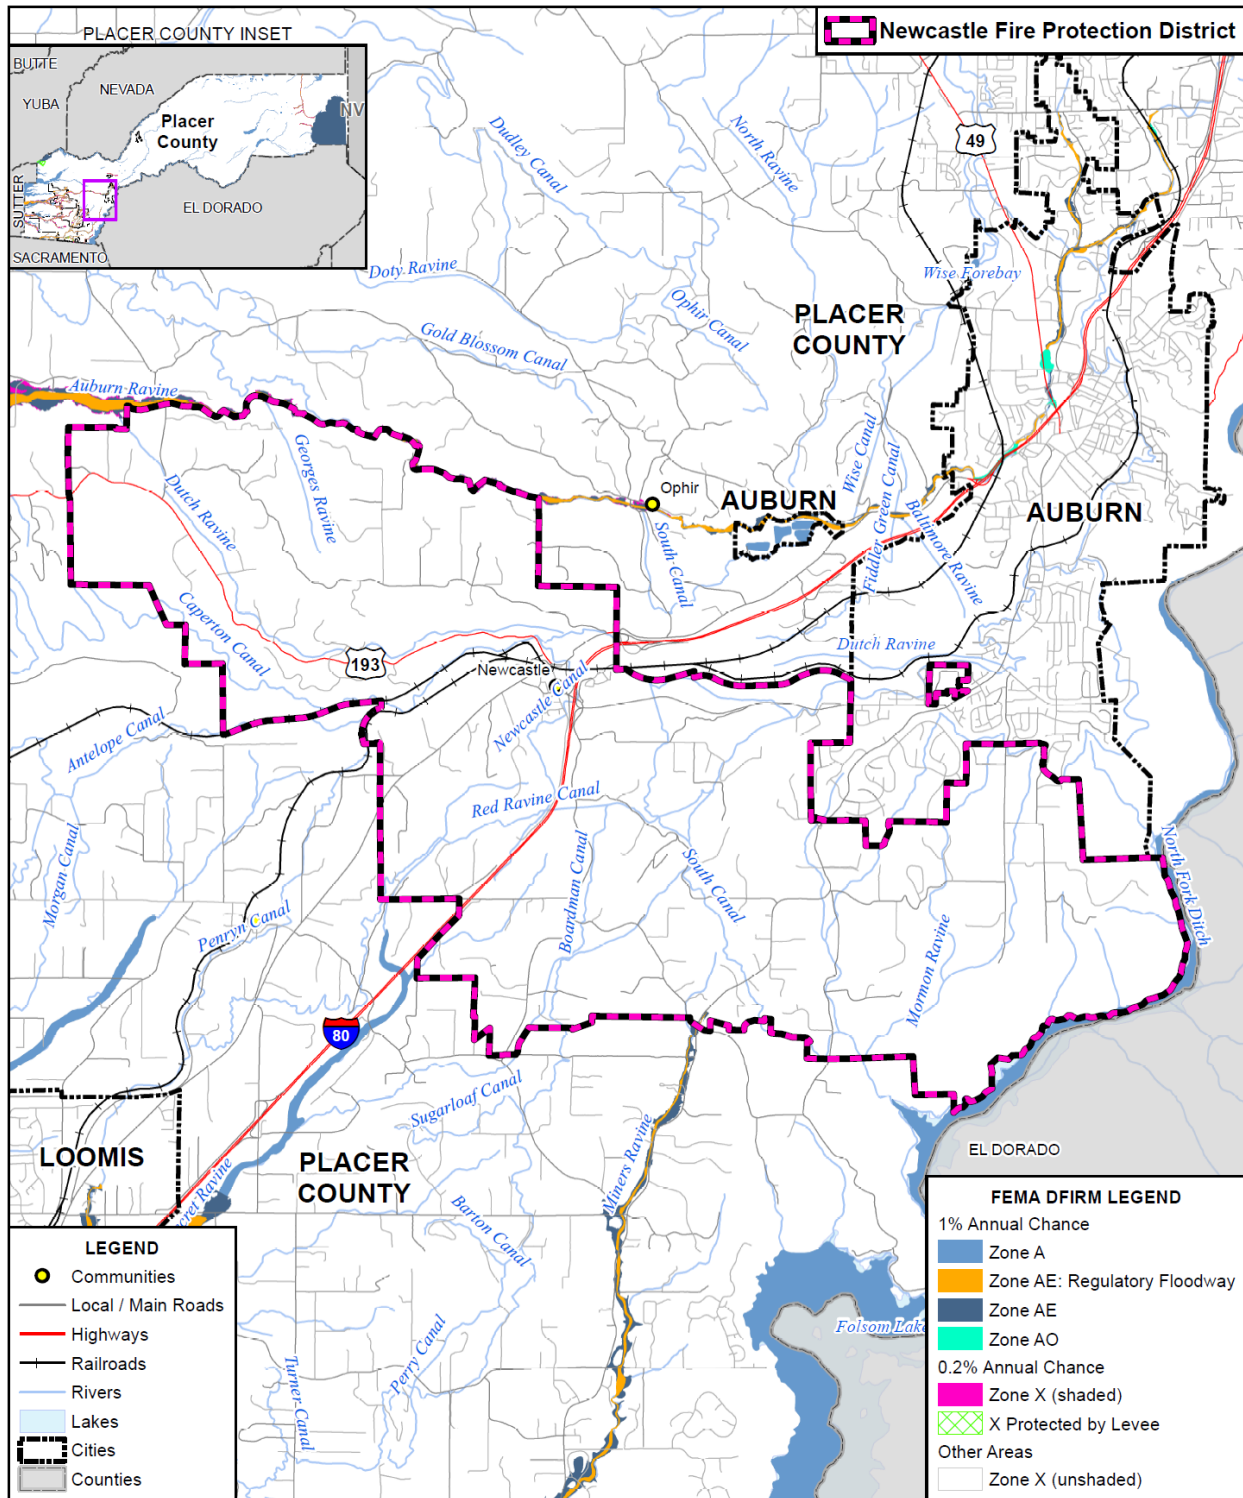

This hazard analyzes the FEMA DFIRM 1% and 0.2% annual chance floods. These tend to be the larger floods that can occur in the County or in the District, and have caused damages in the past. Flooding is a significant problem in Placer County and the District. Historically, the District has been at risk to flooding primarily during the winter and spring months when river systems in the County swell with heavy rainfall and snowmelt runoff. Normally, storm floodwaters are kept within defined limits by a variety of storm drainage and flood control measures. Occasionally, extended heavy rains result in floodwaters that exceed normal high-water boundaries and cause damage.

As previously described in Section 4.3.12 of the Base Plan, the Placer County Planning Area and the Newcastle FPD have been subject to historical flooding.

Location and Extent

The Newcastle FPD has areas located in the 1% annual chance floodplain. This is seen in Figure K-2.

Figure K-2 Newcastle FPD – FEMA DFIRM Flood Zones

Data Source: FEMA DFIRM 11/2/2018, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Table K-5 details the DFIRM mapped flood zones within the 1% annual chance flood zone as well as other flood zones located within the District.

Table K-5 Newcastle FPD– DFIRM Flood Hazard Zones

Flood Zone	Description	Flood Zone Present in the District
A	Areas subject to inundation by the 1% annual-chance flood event generally determined using approximate methodologies. Because detailed hydraulic analyses have not been performed, no Base Flood Elevations (BFEs) or flood depths are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE – Regulatory Floodway	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply. Different from AE in that it adds the water course and adjacent lands that must be reserved in order to discharge the base flood without increasing the water surface elevation by more than one foot.	
AH	An area inundated by 1% annual chance flooding (usually an area of ponding), for which BFEs have been determined; flood depths range from 1 to 3 feet	
AO	Areas subject to inundation by 100-year shallow flooding (usually sheet flow on sloping terrain) where average depths are between one and three feet	
Shaded X	500-year flood the areas between the limits of the 1% annual chance flood and the 0.2-percent-annual-chance (or 500-year) flood	
X Protected by Levee	An area determined to be outside the 500-year flood and protected by levee from 100-year flood	
X	Areas outside of known floodplains.	X

Source: FEMA

Additionally, flood extents can generally be measured in volume, velocity, and depths of flooding. Expected flood depths in the District vary, depending on the nature and extent of a flood event; specific depths are unknown. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Flooding in the District tends to have a shorter speed of onset, due to the amount of water that flows through the District.

Past Occurrences

A list of state and federal disaster declarations for Placer County from flooding is shown on Table K-6. These events also likely affected the District to some degree.

Table K-6 Placer County – State and Federal Disaster Declarations from Flood 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Flood (including heavy rains and storms)	16	1950, 1955, 1958 (twice), 1962, 1963, 1969, 1973, 1980, 1983, 1986, 1995 (twice), 1997, 2008, 2017	13	1955, 1958, 1962, 1964, 1969, 1983, 1986, 1995 (twice), 1997, 2006 (twice), 2017

Source: Cal OES, FEMA

Vulnerability to and Impacts from Flood

Floods have been a part of the District’s historical past and will continue to be so in the future. During winter months, long periods of precipitation and the timing of that precipitation are critical in determining the threat of flood, and these characteristics further dictate the potential for widespread structural and property damages. Predominantly, the effects of flooding are generally confined to areas near the waterways of the County. As waterways grow in size from local drainages, so grows the threat of flood and dimensions of the threat. This threatens structures in the floodplain. Structures can also be damaged from trees falling as a result of water-saturated soils. Electrical power outages happen, and the interruption of power causes major problems. Loss of power is usually a precursor to closure of governmental offices and community businesses. Roads can be damaged and closed, causing safety and evacuation issues. People may be swept away in floodwaters, causing injuries or deaths.

Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits. Direct impacts, such as drowning, can be limited with adequate warning and public education about what to do during floods. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, loss of environmental resources, and economic impacts.

Assets at Risk

No District assets (from Table K-3) are at risk from this hazard.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Flooding occurs in areas other than the FEMA mapped 1% and 0.2% annual chance floodplains. Flooding may be from drainages not studied by FEMA, lack of or inadequate drainage infrastructure, or inadequate maintenance. Localized, stormwater flooding occurs throughout the County during the rainy season from November through April. Prolonged heavy rainfall contributes to a large volume of runoff resulting in high peak flows of moderate duration.

Location and Extent

The Newcastle FPD is subject to localized flooding throughout the District. Flood extents are usually measured in areas affected, velocity of flooding, and depths of flooding. Expected flood depths in the District vary by location. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Localized flooding in the District tends to have a shorter speed of onset, especially when antecedent rainfall has soaked the ground and reduced its capacity to absorb additional moisture.

The District tracks localized flooding areas. localized flood areas identified by the Newcastle FPD are summarized in Table K-7

Table K-7 Newcastle FPD – List of Localized Flooding Problem Areas

Area Name	Flooding	Pavement Deterioration	Washout	High Water	Landslide/ Mudslide	Debris	Downed Trees
Taylor Rd at Tunnel					X		X

Source: Newcastle FPD

Past Occurrences

There have been no federal or state disaster declarations in the County due to localized flooding. The District noted the following past occurrences of localized flooding:

The District noted no minor flooding has occurred in the past 5 years that have caused delays and or re-routing to emergency calls for service.

Vulnerability to and Impacts from Localized Flooding

Historically, much of the growth in the District and County has occurred adjacent to streams, resulting in significant damages to property, and losses from disruption of community activities when the streams overflow. Additional development in the watersheds of these streams affects both the frequency and duration of damaging floods through an increase in stormwater runoff.

Primary concerns associated with stormwater flooding include life safety issues, and impacts to property and to infrastructure that provides a means of ingress and egress throughout the community. Ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Objects can also be buried or destroyed through sediment deposition. Floodwaters can break utility lines and interrupt services. Standing water can cause damage to crops, roads, and foundations. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

The District's concerns with localized flooding include increased response times to emergencies and the ability of citizen evacuation in flooded areas.

Assets at Risk

No District assets (from Table K-3) are at risk from this hazard.

Severe Weather: Extreme Heat

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to FEMA, extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. Heat kills by taxing the human body beyond its abilities. In extreme heat and high humidity, evaporation is slowed, and the body must work extra hard to maintain a normal temperature.” Most heat disorders occur because the victim has been overexposed to heat or has over-exercised for his or her age and physical condition. Older adults, young children, and those who are sick or overweight are more likely to succumb to extreme heat.

In addition to the risks faced by citizens of the District, there are risk to the built environment from extreme heat. While extreme heat on its own does not usually affect structure, extreme heat during times of drought can cause wildfire risk to heighten. Extreme heat and high winds can cause power outages and PSPS events, causing issues to buildings in the District.

Extreme Heat and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, including periods of high winds, high temperatures, and low humidity, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS.

More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Location and Extent

Heat is a regional phenomenon and affects the whole of the District. Heat emergencies are often slower to develop, taking several days of continuous, oppressive heat before a significant or quantifiable impact is seen. Heat waves do not strike victims immediately, but rather their cumulative effects slowly affect vulnerable populations and communities. Heat waves do not generally cause damage or elicit the immediate response of floods, fires, earthquakes, or other more "typical" disaster scenarios.

The NWS has in place a system to initiate alert procedures (advisories or warnings) when extreme heat is expected to have a significant impact on public safety. The expected severity of the heat determines whether advisories or warnings are issued. The NWS HeatRisk forecast provides a quick view of heat risk potential over the upcoming seven days. The heat risk is portrayed in a numeric (0-4) and color (green/yellow/orange/red/magenta) scale which is similar in approach to the Air Quality Index (AQI) or the UV Index. This can be seen in Section 4.3.2 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for heat. The District Planning Team noted that since extreme heat is a regional phenomenon, events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.2.

The District has experienced increased wildfire danger during times of extreme heat and increased medical responses due to heat related illness.

During times of PSPS the District has been affected with loss of power that impacts communications such as internet and phone. Station 41 does not have back-up generator power and is limited in full facility function during these periods.

Vulnerability to and Impacts from Extreme Heat

The District experiences temperatures in excess of 100°F during the summer and fall months. The temperature moves to 105-110°F in rather extreme situations. During these times, drought conditions may worsen. Also, power outages and PSPS events may occur during these times as well, especially when

combined with the potential for severe wind events. Health impacts, including loss of life, are often the primary concern with this hazard, though economic impacts can also be an issue.

Days of extreme heat have been known to result in medical emergencies, and unpredictable human behavior. Periods of extended heat and dryness (droughts) can have major economic, agricultural, and water resources impacts. Extreme heat can also dry out vegetations, making it more vulnerable to wildfire ignitions and spread.

The effects of extreme heat to the District include increased wildfire danger and potential heat related issues to personnel engaging in emergency response.

Assets at Risk

No District assets (from Table K-3) are at risk from this hazard.

Severe Weather: Freeze and Snow

Likelihood of Future Occurrence–Unlikely

Vulnerability–Medium

Hazard Profile and Problem Description

According to the NWS and the WRCC, winter snowstorms can include heavy snow, ice, and blizzard conditions. Heavy snow can immobilize a region, stranding commuters, stopping the flow of supplies, and disrupting emergency and medical services. Accumulations of snow can collapse roofs and knock down trees and power lines. In rural areas, homes and farms may be isolated for days, and unprotected livestock may be lost. The cost of snow removal, damage repair, and business losses can have a tremendous impact on cities and towns.

Heavy accumulations of ice can bring down trees, electrical wires, telephone poles and lines, and communication towers. Communications and power can be disrupted for days until the damage can be repaired. Power outages can have a significant impact on communities, especially critical facilities such as public utilities. Even small accumulations of ice may cause extreme hazards to motorists and pedestrians.

Some winter storms are accompanied by strong winds, creating blizzard conditions with blinding wind-driven snow, severe drifting, and dangerous wind chills. Strong winds accompanying these intense storms and cold fronts can knock down trees, utility poles, and power lines. Blowing snow can reduce visibility to only a few feet in areas where there are no trees or buildings. Serious vehicle accidents with injuries and deaths can result. Freezing temperatures can cause significant damage to the agricultural industry.

Location and Extent

Freeze and snow are regional issues, meaning the entire District is at risk to cold weather and freeze events. While there is no scale (i.e. Richter, Enhanced Fujita) to measure the effects of freeze, the WRCC reports that in a typical year, minimum temperatures fall below 32°F on 22.6 days with 0 days falling below 0°F in western Placer County. Snowfall is measured in depths, and the WRCC reports that average snowfall

on the western side of the County is 1.4 inches. Freeze and snow has a slow onset and can generally be predicted in advance for the County. Freeze events can last for hours (in a cold overnight), or for days to weeks at a time. Snow event can last for hours or days, but is more unlikely in the western portion of the County. When it does snow, the snow often melts relatively quickly.

Past Occurrences

There has been no federal and one state disaster declarations in the County for freeze and snow, as shown on Table K-8.

Table K-8 Placer County – State and Federal Disaster Declarations from Freeze and Snow 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Freeze	1	1972	0	–

Source: Cal OES, FEMA

The District noted that cold and freeze is a regional phenomenon; events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.3. The District experiences very few times of snow with limited impact, usually a short term event. When freeze does occur it can have an impact on travel roads of which may result in extended response times. An increase for calls of service due to broken water pipes does occur during these events as well as traffic accidents.

Vulnerability to and Impacts from Severe Weather: Freeze and Snow

The District experiences temperatures below 32 degrees during the winter months. Freeze can cause injury or loss of life to residents of the District. While it is rare for buildings to be affected directly by freeze, damages to pipes that feed building can be damaged during periods of extreme cold. Freeze and snow can occasionally be accompanied by high winds, which can cause downed trees and power lines, power outages, accidents, and road closures. Transportation networks, communications, and utilities infrastructure are the most vulnerable physical assets to impacts of severe winter weather in the County. During extreme winter events, response times to emergencies may be extended.

Impacts to the District include extended response times, increase in freeze related incidents of broken water pipes, increase in vehicle accidents, and medical emergencies related to freezing conditions.

Assets at Risk

No District assets (from Table K-3) are at risk from this hazard.

Severe Weather: Heavy Rains and Storms (Hail, Lightning)

Likelihood of Future Occurrence–Unlikely

Vulnerability–Medium

Hazard Profile and Problem Description

Storms in the District occur annually and are generally characterized by heavy rain often accompanied by strong winds and sometimes lightning and hail. Approximately 10 percent of the thunderstorms that occur each year in the United States are classified as severe. A thunderstorm is classified as severe when it contains one or more of the following phenomena: hail that is three-quarters of an inch or greater, winds in excess of 50 knots (57.5 mph), or a tornado. Heavy precipitation in the District falls mainly in the fall, winter, and spring months.

Location and Extent

Heavy rain events occur on a regional basis. Rains and storms can occur in any location of the District. All portions of the District are at risk to heavy rains. Most of the severe rains occur during the fall, winter, and spring months. There is no scale by which heavy rains and severe storms are measured. Magnitude of storms is measured often in rainfall and damages. The speed of onset of heavy rains can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of severe storms in California, Placer County, and the District can range from minutes to hours to days. Information on precipitation extremes can be found in Section 4.3.4 of the Base Plan.

Past Occurrences

There have been past disaster declarations from heavy rains and storms, which were discussed in Past Occurrences of the flood section above. According to historical hazard data, severe weather, including heavy rains and storms, is an annual occurrence in the District. This is the cause of many of the federal disaster declarations related to flooding.

Minor rock debris slides have occurred during heavy and prolonged periods of rain. Occurrences are confined to a county roadway. This has happened at Taylor Rd on each side of the tunnel.

Vulnerability to and Impacts from Heavy Rain and Storms

Heavy rain and severe storms are the most frequent type of severe weather occurrences in the District. These events can cause localized flooding. Elongated events, or events that occur during times where the ground is already saturated can cause 1% and 0.2% annual chance flooding. Wind often accompanies these storms and has caused damage in the past. Hail and lightning are rare in the District.

Actual damage associated with the effects of severe weather include impacts to property, critical facilities (such as utilities), and life safety. Heavy rains and storms often result in localized flooding creating significant issues. Roads can become impassable and ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Floodwaters and downed

trees can break utilities and interrupt services. Minor rock debris slides have occurred during heavy and prolonged periods of rain. Occurrences are confined to a county roadway.

During periods of heavy rains and storms, power outages can occur. These power outages can affect pumping stations and lift stations that help alleviate flooding. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Assets at Risk

No District assets (from Table K-3) are at risk from this hazard.

Tree Mortality

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, and contribute to future fuel loads in forests surrounding communities. During extended drought, tree mortality is driven by a build-up in endemic bark beetle populations and exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events.

Location and Extent

Onset of tree mortality events can be relatively fast; however conditions – such as high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas, and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 - 40 dead trees per acre
- Orange depicting 5 -15 dead trees per acre
- Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A number of Placer County areas were designated during this event and the majority of Placer County watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality, along with numerous Tier 1 High hazard “hot spots”. A map of these areas is shown in in Section 4.3.18 of the Base Plan.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015.

The landscape of the District is primarily oak woodland and brush with limited conifer species. Tree mortality has not been prevalent in the District. There has been an occasional tree or so on private properties with tree mortality.

Vulnerability to and Impacts from Tree Mortality

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead trees within the wildland urban intermix or wildland urban interface or urban areas therefore pose a greater risk to due to their proximity to residents, businesses, and road, power, and communication infrastructure.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure.

The primary concerns the District has concerning tree mortality is the increased dead fuel loading for wildfire and falling dead trees into structures causing damage and or injury.

Assets at Risk

No District assets (from Table K-3) are at risk from this hazard.

Wildfire

Likelihood of Future Occurrence–Highly Likely

Vulnerability–High

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the Newcastle FPD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the

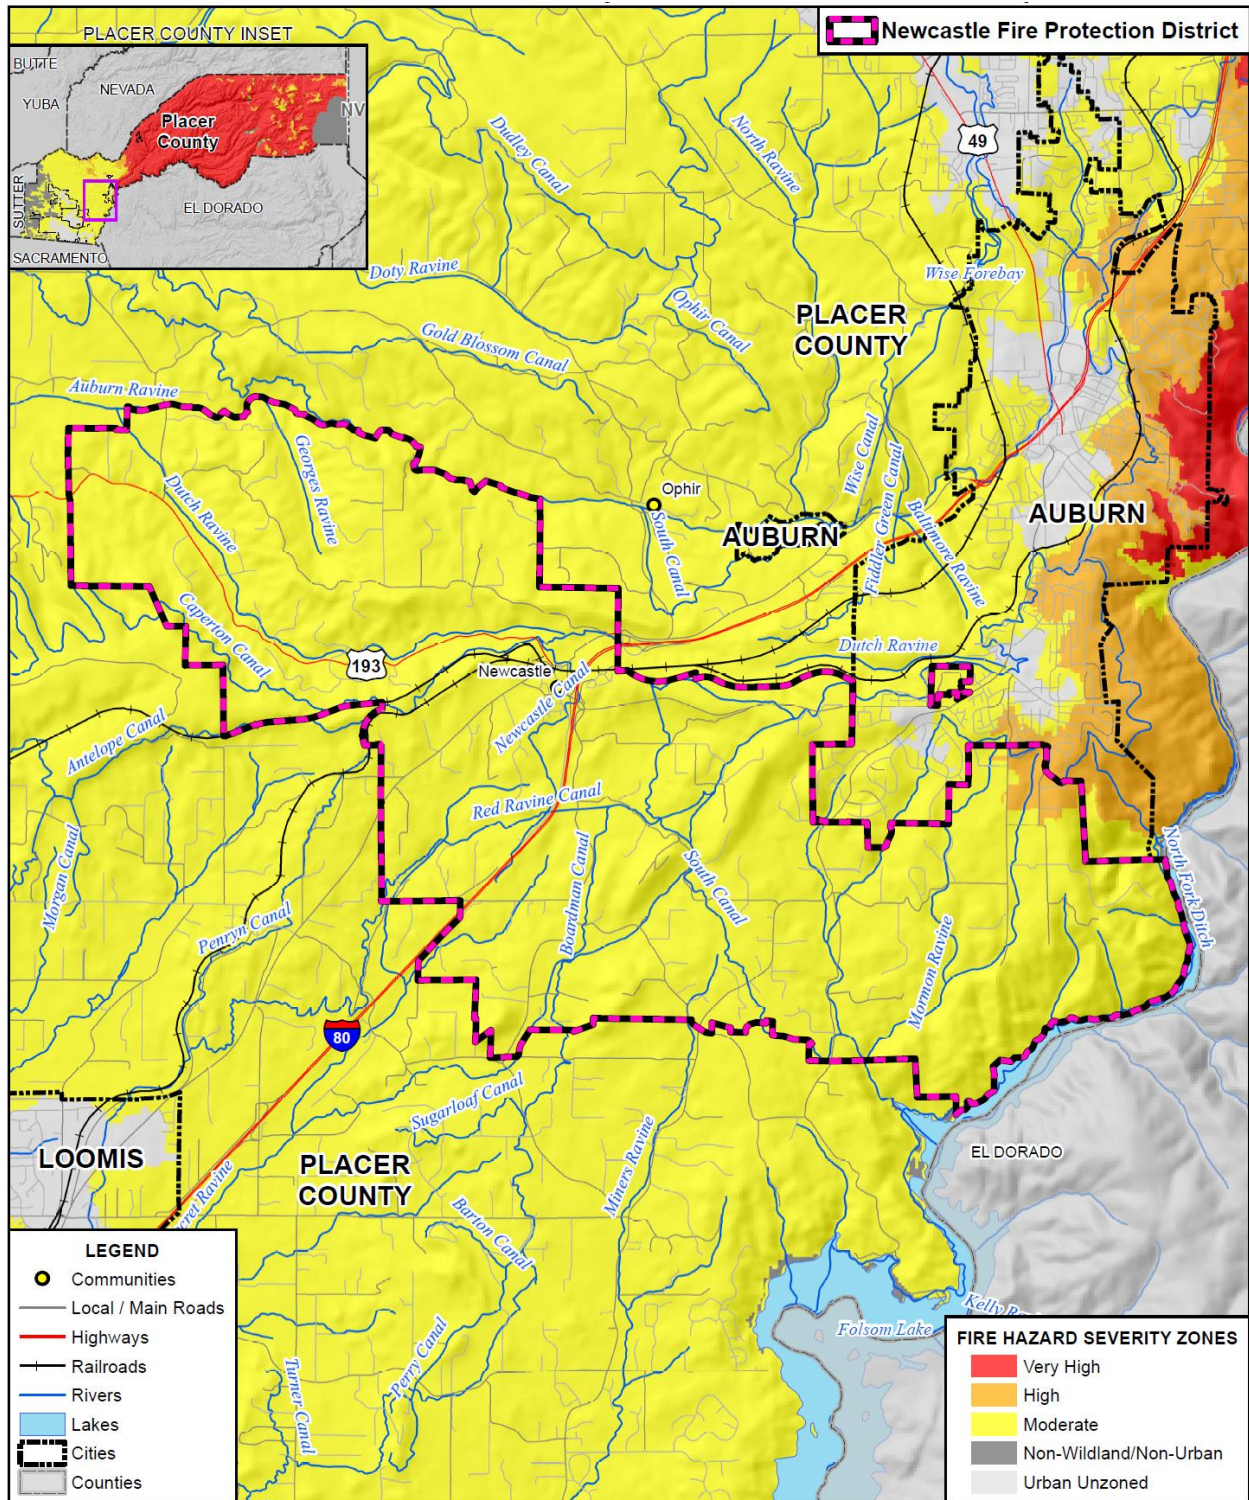

foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the Newcastle FPD were created. Figure K-3 shows the CAL FIRE FHSZ in the District. As shown on the maps, fire hazard severity zones within the District range from moderate to high.

The entire Newcastle Fire District is within State Responsibility Area (SRA). Cal Fire is the primary agency for wildfire with assistance from the Placer Hills Fire District. Wildfire activity is captured and recorded by Cal Fire for the LHMP.

Figure K-3 Newcastle FPD – Fire Hazard Severity Zones

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table K-9.

Table K-9 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

The Newcastle Fire District noted that the District responds to structure fires. There have been no significant sole structure fires within the District in the last 5 years.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat

of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

Since all of the District is within a Fire Hazard Severity Zone as identified by Cal Fire and is a combination of Wildland Urban Intermix and Wildland Urban Interface, main concerns are for the safety of citizens and protection of structures from wildfire. Given the right conditions; weather, fuels, and topography, a wildfire can significantly impact and cause catastrophic damage to development within the District.

Assets at Risk

All District assets (from Table K-3) are at risk from this hazard.

K.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

K.6.1. Regulatory Mitigation Capabilities

Table K-10 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the Newcastle FPD.

Table K-10 Newcastle FPD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	N	
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	Y	Through coordination with Placer County
Continuity of Operations Plan	Y	Local District Operating Procedures, to follow Placer County Plan
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	

Community Wildfire Protection Plan	Y	In coordination with the Greater Auburn Area Fire Safe Council
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Y	Version/Year: Enforced through Placer County CDRA
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	Y	Rating: 4/4X
Site plan review requirements	Y	Enforced through District Standard Conditions for Development
		Is the ordinance an effective measure for reducing hazard impacts?
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	N	(All these areas the District falls under Placer County)
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
Continued cooperative planning and building review processes to ensure all agencies apply mitigation measures and conditions for development.		

Source: Newcastle FPD

The District has and continues to adopt Ordinances to mitigate issues related to fire and life safety. These Ordinances include adoption of the most current California Fire Code, Placer County Hazardous Vegetation Ordinance with an MOU for enforcement/abatement services, Fee schedules for plan review, approval, and inspection to ensure compliance with Ordinances.

K.6.2. Administrative/Technical Mitigation Capabilities

Table K-11 identifies the District department(s) responsible for activities related to mitigation and loss prevention in the District.

Table K-11 Newcastle FPD’s Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	Y	In coordination with Placer County
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	N	
Mutual aid agreements	Y	Through Western Placer County Fire Chiefs Association, closest resources response agreement
Other	Y	Placer County Code Enforcement for abatement of hazardous vegetation
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	Y	In coordination with Placer County
Floodplain Administrator	N	
Emergency Manager	Y	In coordination with Placer County
Community Planner	Y	In coordination with Placer County
Civil Engineer	Y	In coordination with Placer County
GIS Coordinator	Y	In coordination with Placer County
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	In coordination with Placer County
Hazard data and information	Y	In coordination with Placer County
Grant writing	N	
Hazus analysis	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Continued cooperative planning and inspection processes to ensure all agencies apply mitigation measures and conditions to reduce risk.		

Source: Newcastle FPD

K.6.3. Fiscal Mitigation Capabilities

Table K-12 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table K-12 Newcastle FPD’s Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	From Impact Fees and Special Assessments
Authority to levy taxes for specific purposes	Y	Voter Approved
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	Y	Used for capital expenditures
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	Not Used
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	N	
State funding programs	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District will continue to seek grant monies from all sources in order to better protect residents and structures in District territories.		

Source: Newcastle FPD

K.6.4. Mitigation Education, Outreach, and Partnerships

Table K-13 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table K-13 Newcastle FPD’s Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	Greater Auburn Area Fire Safe Council, Placer County Fire Alliance. Evaluate risk and identify projects to reduce wildfire risk.
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	Updated web site, social media- Facebook, Twitter. To get safety messages out to public
Natural disaster or safety related school programs	Y	Through School Programs
StormReady certification	N	
Firewise Communities certification	Y	Through Placer County Fire Alliance and FIREWISE Coordinator.
Public-private partnership initiatives addressing disaster-related issues	N	

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Other		
How can these capabilities be expanded and improved to reduce risk?		
Continued participation with allied agencies and organizations and collaborate with single messaging on specific issues.		

Source: Newcastle FPD

K.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

The District is involved in a variety of mitigation activities including public education, fuels management projects, and other activities to reduce fuel loads and fire risk. These mitigation activities include:

- **Public Education and Fire Safety**
 - ✓ A variety of public outreach activities are conducted throughout the district on an ongoing basis.
 - ✓ The District has a program where they make address signs and provide them to the public at cost.
 - ✓ The District promotes the use of the County Chipper for local residents.

- **Defensible Space**
 - ✓ When staffing is available for program management, the District provides defensible space inspections for area residents upon request.
 - ✓ When staffing is available for program management complaint based inspections occur for vegetation management on private properties to be in compliance with the Hazardous Vegetation Ordinance.

- **New Development**
 - ✓ The District has a comprehensive review, approval, and inspection process for all new development within the Districts that address fire and life safety issues in addition to the Placer County development process.

K.7 Mitigation Strategy

K.7.1. Mitigation Goals and Objectives

The Newcastle FPD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

K.7.2. Mitigation Actions

The planning team for the Newcastle FPD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost,

and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Climate Change
- Drought & Water Shortage
- Floods: 1%/0.2% annual chance
- Floods: Localized Stormwater
- Severe Weather: Extreme Heat
- Severe Weather: Freeze and Snow
- Severe Weather: Heavy Rains and Storms
- Tree Mortality
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Private roadway and driveway vegetation clearances.

Hazards Addressed: Drought and Water Shortage, Climate Change, Tree Mortality, Wildfire, Extreme Heat, Freeze and Snow (limb removal)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Many private roadways and driveways throughout the fire district contain dense flammable vegetation along the shoulders of the roadway/driveway as well vertical clearances. This can impede fire resource response and somewhat limit access in the event of an emergency. During wildfire conditions this can pose significant risk to responders as well as civilians.

Project Description: Through inspection, identify those areas needing fuel reduction along private roadways and driveways. Optimal clearance is 10 feet from each shoulder and 15 vertical clearance. Inform property owners of the importance and their responsibility to create and maintain these accesses for emergency response and civilian evacuation. Implement the formal process of “Notice to Abate” as needed.

Other Alternatives: No other alternatives are identified at this time.

Existing Planning Mechanism(s) through which Action Will Be Implemented: All new constructed roads and driveways will be conditioned to create and maintain clearance through the plan review and approval process as a condition to develop.

Through inspection as well as emergency response to incidents, personnel will identify areas needing appropriate clearance. Once identified, a process will be initiated based on the Placer County Hazardous Vegetation Ordinance and local fire district adopted ordinance.

Responsible Agency/ Department/Partners: Newcastle Fire Protection District staff officers and engine company personnel.

Cost Estimate: Currently the District has one part-time funded Fire Marshal position to manage this program. Additional funding will increase success in implementation. Property owners are responsible for implementing clearance requirements.

Benefits (Losses Avoided): Prevent delay in emergency response to incidents and potentially increased ability of civilian evacuation. Reduce vegetation to reduce fuel loading and the risk of wildfire.

Potential Funding: Possible grant funding for large scale roadside clearing projects for project management and fuel reduction implementation.

Timeline: Ongoing

Project Priority (H, M, L): High

Action 2. Address signage for residential and commercial structures.

Hazards Addressed: Multi-Hazard (Climate Change, Drought & Water Shortage, Floods: 1%/0.2% annual chance, Floods: Localized Stormwater, Severe Weather: Extreme Heat, Severe Weather: Freeze and Snow, Severe Weather: Heavy Rains and Storms, Tree Mortality, Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Many structures throughout the District have either no addressing or limited addressing that is not consistent. Many structures were built at a time when there was no addressing standard in place. There is now a standard created by Placer County for consistent addressing in unincorporated areas of Placer County.

Project Description: Apply Placer County standard for addressing for all new construction throughout the fire district. Identify structures needing appropriate addressing and inform and educate property owners of a standard and consistent addressing means.

Other Alternatives: No other alternatives are identified at this time.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Addressing for new construction will be identified and implemented during the plan review and approval process as a condition

to develop. Through inspection as well as emergency response to incidents where addressing is lacking, inform and educate property owners of the value of appropriate addressing.

Responsible Agency/ Department/Partners: Newcastle Fire Protection District staff officers and engine company personnel.

Cost Estimate: No costs identified, use of district personnel to implement. Costs for address signage will be the responsibility of the property owner. Estimated at \$40-\$60 dependent upon where obtained.

Benefits (Losses Avoided): Prevent delay in emergency response to incidents. Can assist in incidents requiring evacuation and in pre-planning communities for major incidents.

Potential Funding: Possible grant funding for large scale “addressing project”. The Placer Hills Firefighter Association creates address signs for citizens as a fund raising project.

Timeline: Ongoing

Project Priority (H, M, L): High

Action 3. Provide Advanced Life Support (ALS) services utilizing paramedics on the engine company.

Hazards Addressed: Multi-Hazard (Climate Change, Drought & Water Shortage, Floods: 1%/0.2% annual chance, Floods: Localized Stormwater, Severe Weather: Extreme Heat, Severe Weather: Freeze and Snow, Severe Weather: Heavy Rains and Storms, Tree Mortality, Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Currently the Newcastle Fire Protection District responds with two (2) personnel on the engine company and provides Basic Life Support (BLS) utilizing EMT’s. Approximately 80% of calls are medical related and providing ALS to the community would deliver a higher level of care to the sick and injured. Such services have been proven to provide life saving measures to those with the most serious injuries and sicknesses.

Project Description: Provide daily paramedic staffing on the engine company at all times; 24/7. Procure, maintain, and manage personnel certification and equipment related to ALS.

Other Alternatives: No other alternatives are identified at this time, BLS to remain the standard if ALS is not implemented.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Through advanced medical training, future new paramedic hires, and utilizing the Joint Operations Agreement (JOA) with Placer Hills Fire District personnel, ALS can be obtained as the standard level of care for medical emergencies.

Responsible Agency/ Department/Partners: Newcastle Fire Protection District designated staff, under cooperative agreement with Placer Hills Fire District, will implement, and manage this program under the authority of the Sierra-Sacramento Valley EMS Agency.

Cost Estimate: The District is currently exploring all costs associated with providing ALS services. Costs associated with ALS services include training and certification of personnel, procurement of ALS equipment, medical supplies associated with ALS, billing and cost recovery, and record management systems. Currently there is one (1) paramedic qualified personnel in the Newcastle Fire District response system, a minimum of two (2) additional personnel are needed to fully deliver ALS services.

Benefits (Losses Avoided): Delivery of a higher level of medical care to the sick and injured of which can result in the saving of lives.

Potential Funding: Potential funding for personnel training and initial equipment purchase may be obtained through the Western Placer County Fire Chiefs Association EMS fund. This would be an anticipated one-time funding source at start up. The District is in the evaluation phase of implementing a “first Responder” fee of which would allow the District to collect fees for response of which may cover continued costs of an ALS program. Other grant opportunities will be explored to create and maintain this ALS program.

Timeline: Currently in process of collecting initial start-up costs and potential recovery fees needed to sustain an ALS program. Desirable to have an ALS program up and running in six (6) months. Ongoing

Project Priority (H, M, L): High

Action 4. Defensible space inspection and implementation throughout the District.

Hazards Addressed: Drought and Water Shortage, Climate Change, Tree Mortality, Wildfire, Extreme Heat

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Most all of the District lies within High or Moderate Fire Severity Zones as identified by Cal Fire. The application of defensible space and home hardening are ways to reduce the risk of wildfire destruction. Although homeowners/business owners are aware of such risks, through an inspection process property owners can be better informed of what action they can do to reduce such risks.

Project Description: Through an inspection process, educate, inform, and make recommendation for property owners on what actions to take to reduce the risk of destruction from wildfire. Identify vegetation to remove, reduce, and maintain to achieve defensible space. Identify potential areas of home hardening to better prepare for wildfire. Conduct inspections on private properties to identify specific needs of that property to achieve defensible space.

Other Alternatives: No other alternatives are identified at this time.

Existing Planning Mechanism(s) through which Action Will Be Implemented: All new construction will be conditioned to create and maintain defensible space through the plan review and approval process as a condition to build. Through an inspection program, identify areas to conduct property inspections. The basis of the inspection program will utilize Public Resource Code (PRC), Placer County Hazardous Vegetation Ordinance, and local fire district adopted ordinance.

Responsible Agency/ Department/Partners: Newcastle Fire Protection District designated staff will implement and manage this inspection program.

Cost Estimate: Currently the District has one part-time funded Fire Marshal position to manage this program. Additional funding will increase success in implementation. Property owners are responsible for implementing clearance requirements.

Benefits (Losses Avoided): Reduction of property loss due to wildfire may be obtained through such a program.

Potential Funding: Possible grant funding for fulltime and or additional personnel for project management and inspection. Potential of charging fee for inspection.

Timeline: Ongoing

Project Priority (H, M, L): High

Action 5. Relocate and construct a new fire station for the Newcastle Fire Protection District.

Hazards Addressed: Drought and Water Shortage, Climate Change, Tree Mortality, Wildfire, Extreme Heat

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The current Newcastle Fire Protection District fire station has been in service since 1922. It has been modified over the years to accommodate the needs of personnel and equipment and due to building issues, space issues, and location, is no longer suitable to operate as a fire response facility. This District has been planning for a new fire facility for a number of years and has a “special assessment” levied on district properties to go towards the construction of a new fire station. The district has secured the land for this facility and has developed plans and drawings for this facility as well as obtained costs for the project.

Project Description: Provide a new fire facility capable of supporting emergency response personnel with 24/7 operations, housing emergency response vehicles and equipment, and provide public access for conducting routine business associated with the fire district.

Other Alternatives: No other alternatives are identified; the current fire facility cannot be renovated to accommodate fire district needs.

Existing Planning Mechanism(s) through which Action Will Be Implemented: The Newcastle Fire Protection District Board of Directors along with the Fire Chief and District Manager continue to further along the process of constructing a new fire facility. The Board has created a “New Fire Station Committee” that has spent a great deal of time over the years obtaining and completing all necessary measures to move forward with this project.

Responsible Agency/ Department/Partners: Newcastle Fire Protection District Board and designated command staff are working with Planning, Building, and Finance agencies to implement this project.

Cost Estimate: Cost estimates continue to rise as the years go by. Currently the District is attempting to secure financial loan funding through different sources. Currently the District is in the process in obtaining loan funding through a USDA loan program and continues to work with Placer County Finance leaders as a potential alternative for funding. Current cost estimates for this project range from 4-5 million dollars.

Benefits (Losses Avoided): A fire facility capable of supporting personnel and equipment for emergency response to the Newcastle Fire Protection District and surrounding areas.

Potential Funding: Funding for this project will be through collected property taxes, current benefit assessments levied on district properties, and potential additional assessments levied on district properties. The district is currently in the process of obtaining loan funding through a USDA loan program. Additional grant and or loan funding are also being considered.

Timeline: The District is 3-4 years behind in this project due to securing funding to escalating costs associated with this project. It is necessary to begin construction on this project within 2021 to secure ownership of the land that will be used for the new facility. Ongoing with a project completion date within 12-18 months of securing loan funding.

Project Priority (H, M, L): High

Action 6. *Participate and collaborate with the Greater Auburn Area Fire Safe Council (GAAFSC) and contribute to the Community Wildfire Protection Plan (CWPP)*

Hazards Addressed: Drought and Water Shortage, Climate Change, Tree Mortality, Wildfire, Extreme Heat

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The Newcastle Fire Protection District is within the boundaries of the GAAFSC. Newcastle Fire Protection District has been involved with the GAAFSC throughout the years. The Fire Safe Council’s in Placer County contribute greatly to the CWPP. This is opportunity for local fire agencies to be involved in such a process.

Project Description: The Newcastle Fire Protection District participates in the GAAFSC. Continued participation and collaboration will occur on an on-going basis. Attending monthly meetings and participate in GAAFSC events.

Other Alternatives: No other alternatives have been identified that includes such collaboration

Existing Planning Mechanism(s) through which Action Will Be Implemented: Identify staff personnel to attend meetings and GAAFSC events.

Responsible Agency/ Department/Partners: Newcastle Fire Protection District command staff.

Cost Estimate: No costs are associated with this action.

Benefits (Losses Avoided): Keep current on projects and public outreach campaigns. Develop a collaborative approach to the wildfire risks and reduction methods. Participate in the CWPP process.

Potential Funding: Possible grant funding through the GAAFSC to assist Newcastle Fire Protection District with fuel reduction and related projects.

Timeline: Ongoing

Project Priority (H, M, L): High

Action 7. Heavy Rains, Localized Flooding, Flood, Freeze, and Snow Mitigation

Hazards Addressed: Flood, Localized Flooding, Freeze and Snow.

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: From time to time, the District experiences localized heavy rains that create minor flooding on streets and roads used for emergency response. In addition, freezing may occur occasionally. This natural occurrence of rain, and freeze can have an impact on response to emergencies.

Project Description: Obtain the most up-to-date information regarding adverse weather, predicted weather events, and related weather that may impact District response to emergencies.

Other Alternatives: No other alternatives are identified at this time.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Coordinate with Placer OES on specific predicted weather events. Plan response accordingly to specific event: alternate routes for flooded areas and apparatus with appropriate chains for ice. Notify Placer County Roads through Placer Dispatch for problem areas that include flooding; need for storm drain clearing, sanding of roads for ice and snow, and road closures.

Responsible Agency/ Department/Partners: Newcastle Fire Protection District staff officers and engine company personnel.

Cost Estimate: No costs identified with this operational procedure.

Benefits (Losses Avoided): Prevent delay in emergency response to incidents and safety of responding personnel.

Potential Funding: None identified for this mitigation.

Timeline: Ongoing

Project Priority (H, M, L): Medium

Annex L Northstar Community Services District and Fire Department

L.1 Introduction

This Annex details the hazard mitigation planning elements specific to Northstar Community Services District and Fire Department (NCSD & FD&FD or District), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to NCSD & FD, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

L.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table L-1. Additional details on plan participation and District representatives are included in Appendix A.

Table L-1 NCSD & FD – Planning Team

Name	Position/Title	How Participated
Eric Martin	District Engineer	Plan Contributor
Joe Barron	Forester	Plan Contributor
Jason Gibeaut	Division Chief	Plan Contributor
Sean Bailey	Fire Chief	Plan Contributor
Jeff Botto	Fire Engineer	Plan Organizer

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the District integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the District incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table L-2.

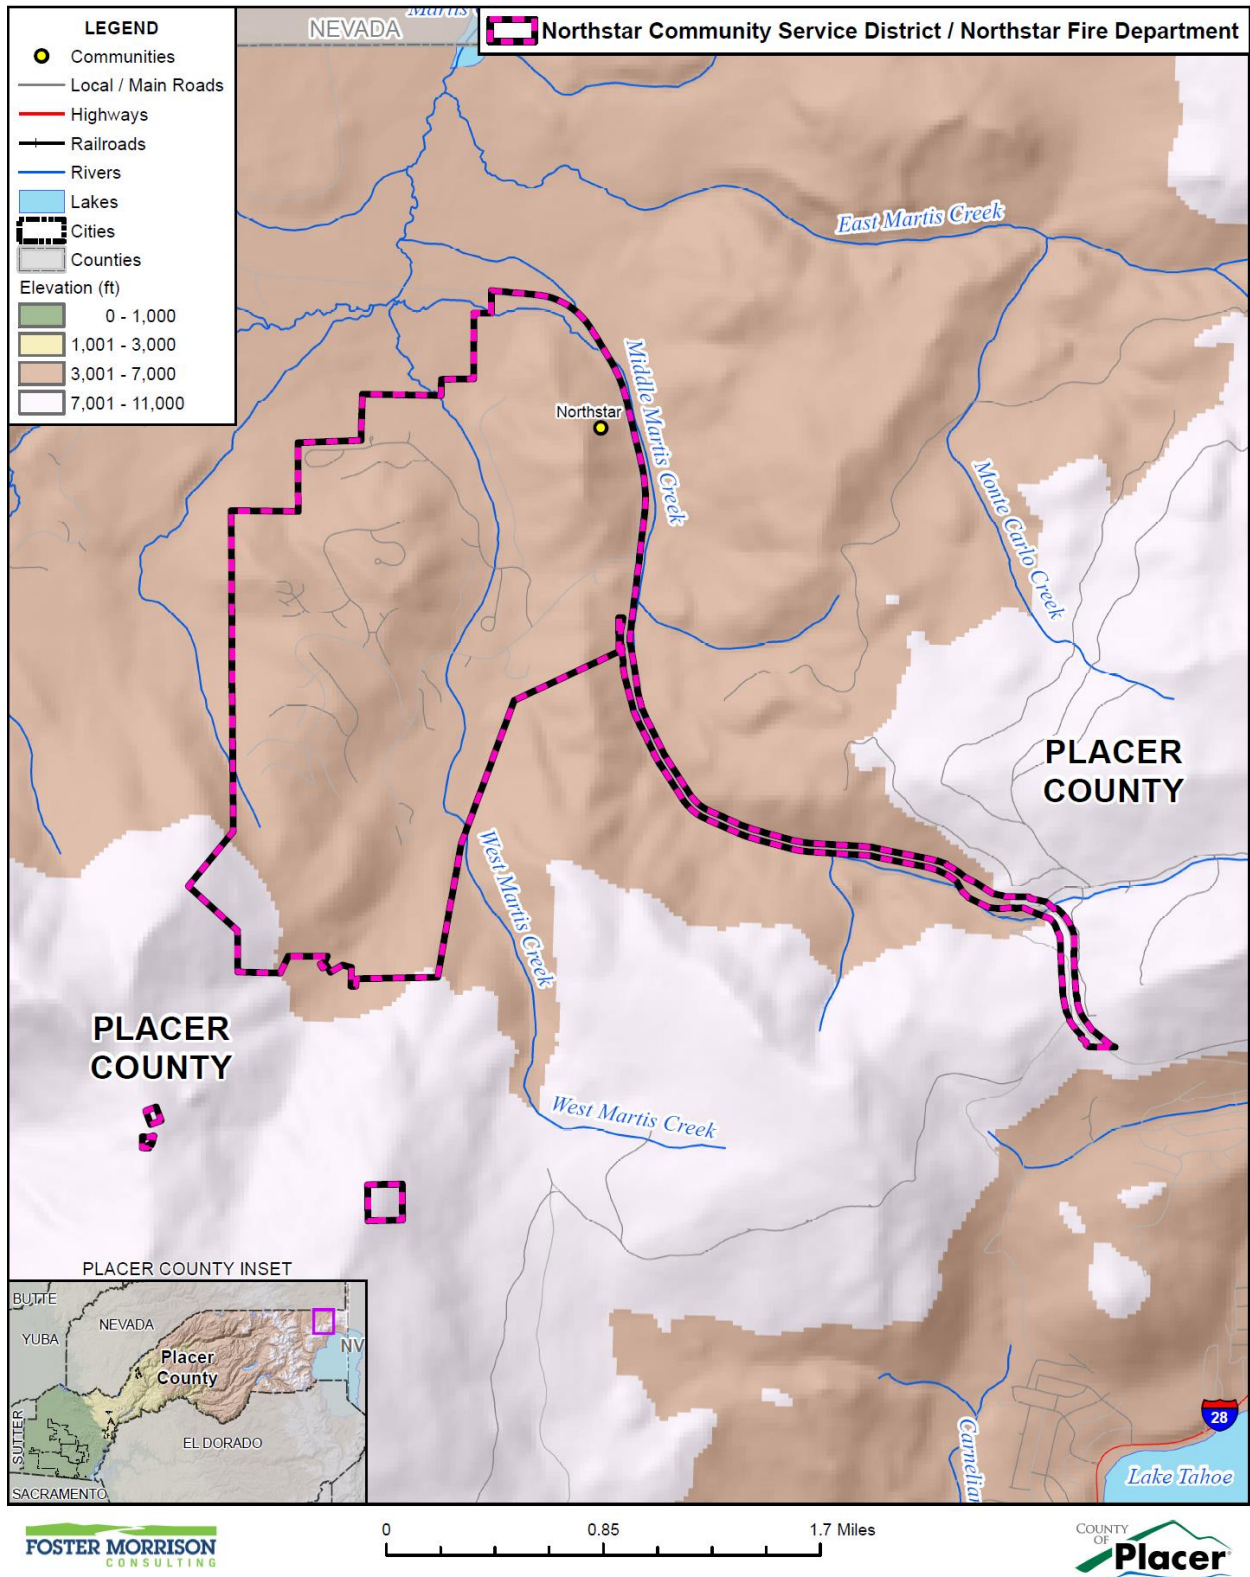

Table L-2 2016 LHMP Incorporation

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
N/A	No related planning was done by the District since 2016.

L.3 District Profile

The District profile for the NCSD & FD is detailed in the following sections. Figure L-1 displays a map and the location of the District within Placer County.

Figure L-1 NCSD & FD

L.3.1. Overview and Background

In 1972, the Northstar Fire Department was formed as a Placer County Services Area governed by the Placer County Board of Supervisors. The Northstar Community Services District (NCSD & FD) was founded in 1990 under Government Code 61600 as a local government entity to serve the Northstar region with governmental services. The District currently provides water, sewer collection, solid waste management, recycling services, fire protection, fuels management, snow removal, road surface maintenance, and trail construction and maintenance. These services are supported by property taxes, the Measure E Parcel Tax, and water, sewer and solid waste user fees.

In the fall of 2015, after six years of operating the adjacent water system through a contract with Placer County Water Agency, the District acquired full ownership and operations of the Martis Valley Water System serving Lahontan, Martis Camp, Schaffer's Mill, and Hopkins Village. The District looks forward to continuing the highest level of service as we experience continued growth in our service area.

The NCSD & FD is governed by a five-person, elected Board of Directors composed of registered voters from the communities served by the District. The role of the Board of Directors is to provide responsible leadership by determining District policy while day-to-day operations are overseen by a board-appointed General Manager.

L.4 Hazard Identification

NCSD & FD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table L-3).

Table L-3 NCSD & FD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Limited	Unlikely	Negligible	Low	Medium
Avalanche	Significant	Unlikely	Negligible	Low	Medium
Climate Change	–	–	–	–	–
Dam Failure	Limited	Unlikely	Limited	Medium	Medium
Drought & Water Shortage	Extensive	Occasional	Negligible	Low	High
Earthquake	Extensive	Occasional	Limited	Medium	Low
Floods: 1%/0.2% annual chance	Significant	Occasional	Negligible	Low	Medium
Floods: Localized Stormwater	Significant	Occasional	Negligible	Low	Medium
Landslides, Mudslides, and Debris Flows	Limited	Unlikely	Negligible	Low	Medium
Levee Failure					Medium
Pandemic	Extensive	Occasional	Critical	Medium	Medium
Seiche					Medium
Severe Weather: Extreme Heat	Extensive	Unlikely	Negligible	Low	High
Severe Weather: Freeze and Snow	Extensive	Highly-likely	Negligible	Medium	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Occasional	Negligible	Low	Medium
Severe Weather: High Winds and Tornadoes	–	–	–	–	Low
Tree Mortality	Significant	Highly Likely	Negligible	Medium	High
Wildfire	Extensive	Likely	Catastrophic	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

L.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District's hazards and assess the District's vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

L.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section L.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table L-3) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

L.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District's total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the NCS&D & FD's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table L-4 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. NCS&D & FD's physical assets, valued at over \$1.6 billion, consist of the buildings and infrastructure to support the District's operations.

Table L-4 NCS&D & FD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
267 Lift Station	Sewer Pump Facility	70 Hwy 267	\$1,750,000	Earthquake, Severe Weather: Freeze and Snow
Administrative/Engineering Office	Office Building	900 Northstar Dr	\$4,629,535	Earthquake, Severe Weather: Freeze and Snow, Wildfire, Pandemic
Former Administrative Office	Office Building	908 Northstar Dr	\$1,780,260	Earthquake, Severe Weather: Freeze and Snow, Wildfire, Pandemic
Tank #1/Res F	903 & 900 Road	903 & 900 Road	\$488,988	Earthquake, Severe Weather: Freeze and Snow, Wildfire
Corp Yard Shop Building	Maintenance/Storage	51 Trimont Ln	\$1,630,864,000	Earthquake, Severe Weather: Freeze and Snow, Wildfire
Fuel Enclosure	Fueling	51 Trimont Ln	\$157,830	Earthquake, Severe Weather: Freeze and Snow, Wildfire
Tank D Pump Station	Water Pump Facility	Big Springs	\$1,210,009	Earthquake, Severe Weather: Freeze and Snow, Wildfire
Tank #2/Res F	Water Storage	903 & 900 Road	\$670,779	Earthquake, Severe Weather: Freeze and Snow, Wildfire
Corp Yard Equipment Bays	Equipment Storage	51-C Trimont	\$494,517	Earthquake, Severe Weather: Freeze and Snow, Wildfire
Tank #2/Res C	Water Storage	Coyote Fork	\$1,735,561	Earthquake, Severe Weather: Freeze and Snow, Wildfire

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Northstar Drive Pump Station	Water Pump Facility	914 Northstar Dr	\$1,210,009	Earthquake, Severe Weather: Freeze and Snow, Wildfire

Total			\$1,667,398,507.00	

Source: NCSD & FD

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. NCSD & FD serves an estimated population of 3,053 residents. In addition to permanent residents, NCSD & FD serves a substantial number of seasonal and part-time residents, hotel guest, short-term rentals, and day visitors. Seasonal influxes in population can vary by up to 20,000 persons.

Natural Resources

NCSD & FD has a variety of natural resources of value to the District. These natural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Historic and Cultural Resources

NCSD & FD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan.

The District noted that Mountainside Builders, the main developer at Northstar is not taking on much at the moment. 5-10 new residences are expected in 2021. The District's Zone 4 Water System on the other hand is seeing increased activity in Martis Camp, Lahontan, and Schaffer's Mill.

Development since 2016

No District facilities have been constructed since 2016. The Administration Building was the last facility constructed and that was 2015. The District continues to have preventative maintenance on all facilities, but no major overhauls since 2016

Developers are currently building out the Highlands II Subdivision. 10G has an expected completion date of 2021. The developer has current entitlements that will continue development for the next 20 years and additional properties have been identified for future entitlements.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. More general information on growth and development in Placer County as a whole can be found in "Growth and Development Trends" in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

L.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table L-3 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Dam Failure

Likelihood of Future Occurrence—Unlikely

Vulnerability—Medium

Hazard Profile and Problem Description

Dams are manmade structures built for a variety of uses including flood protection, power generation, agriculture, water supply, and recreation. When dams are constructed for flood protection, they are usually engineered to withstand a flood with a computed risk of occurrence. For example, a dam may be designed to contain a flood at a location on a stream that has a certain probability of occurring in any one year. If prolonged periods of rainfall and flooding occur that exceed the design requirements, that structure may be overtopped or fail. Overtopping is the primary cause of earthen dam failure in the United States.

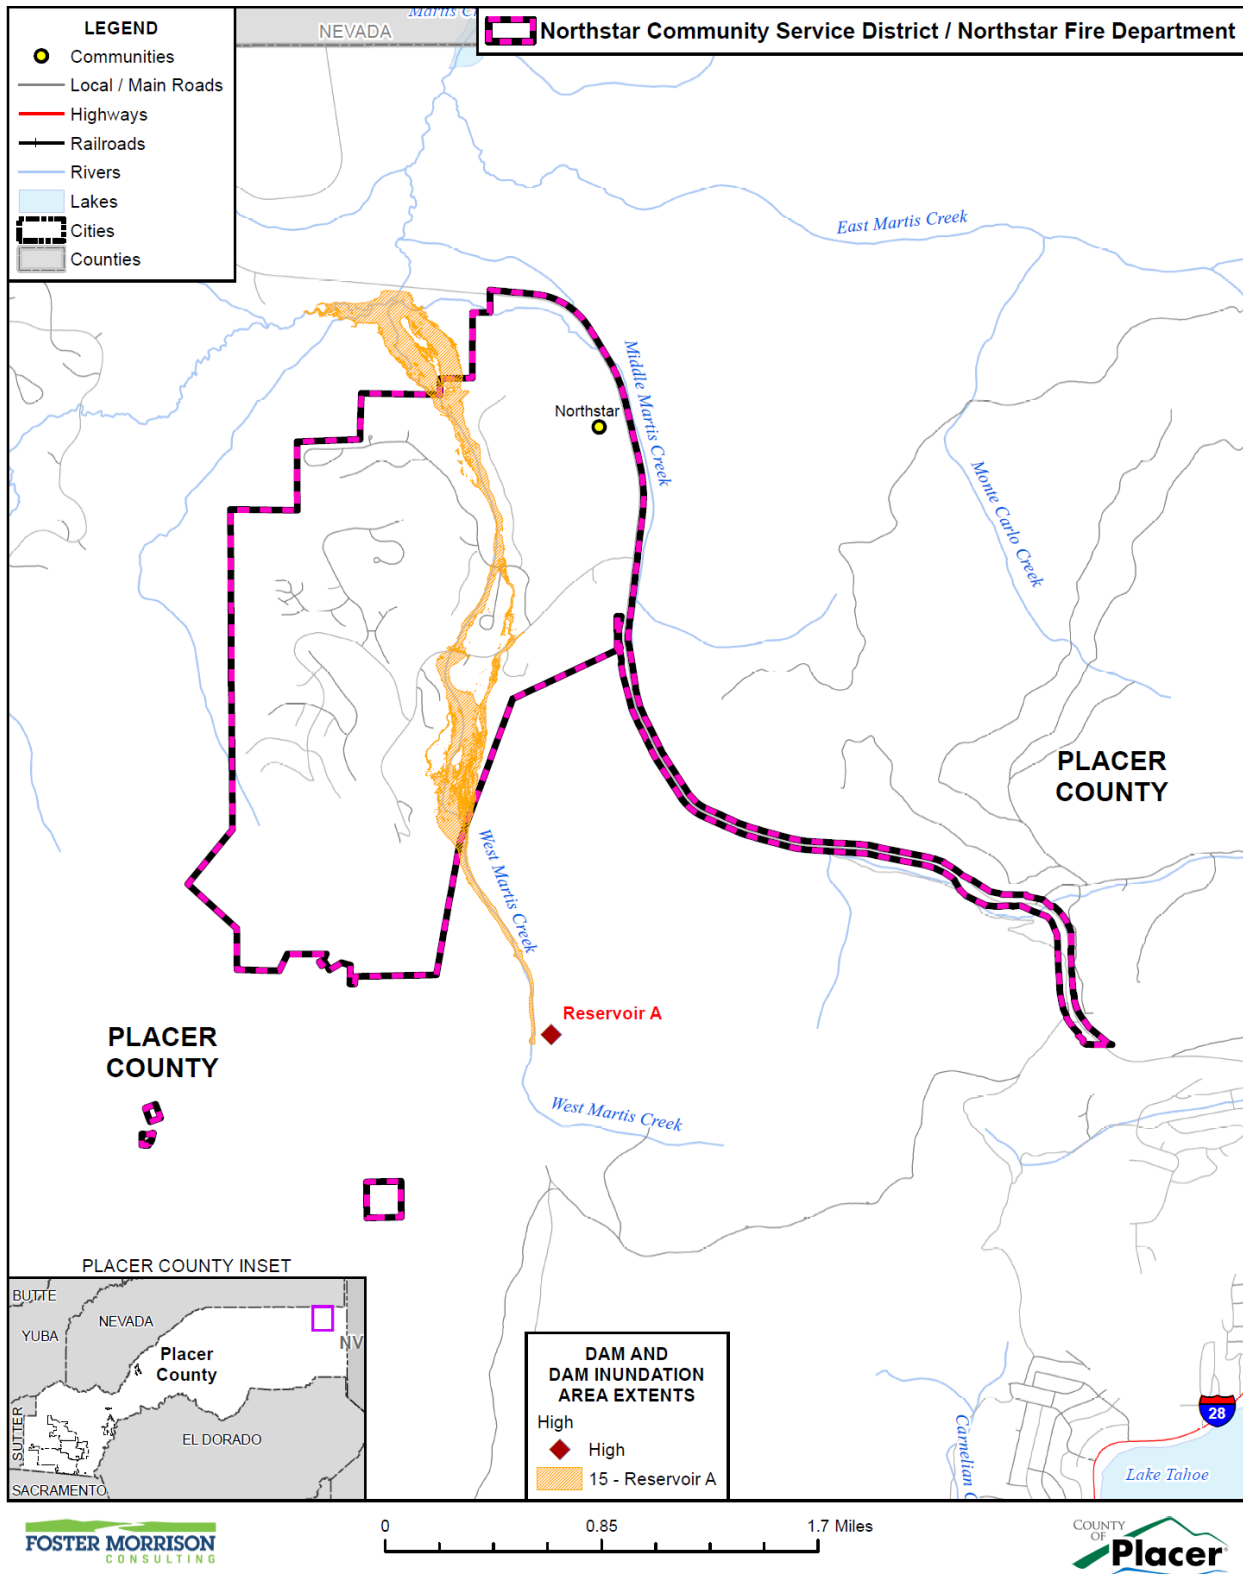

Location and Extent

Dam failure is a natural disaster from two perspectives. First, the inundation from released waters resulting from dam failure is related to naturally occurring floodwaters. Second, a total dam failure would most probably happen as a consequence of the natural disaster triggering the event, such as an earthquake. There is no scale with which to measure dam failure. However, Cal DWR Division of Safety of Dams (DOSD) assigns hazard ratings to dams within the State that provides information on the potential impact should a dam fail. The following two factors are considered when assigning hazard ratings: existing land use and land use controls (zoning) downstream of the dam. Dams are classified in four categories that identify the potential hazard to life and property: Low, Significant, High, and Extremely High. These were discussed in more detail in Section 4.3.9 of the Base Plan.

While a dam may fill slowly with runoff from winter storms, a dam break has a very quick speed of onset. The duration of dam failure is generally not long – only as long as it takes to empty the reservoir of water the dam held back. The District would be affected for as long as the flood waters from the dam failure took to drain downstream.

Dams inside the County that can affect the District can be seen on Figure L-2. The dam in question here is the Reservoir A dam that is owned by the NCSD & FD&FD.

Figure L-2 NCSD & FD – Dam Inundation Areas from Dams Inside the County

Data Source: DWR DSOD Data 2020, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

The Reservoir A Dam (National ID No. CA01112) is owned by the Northstar Community Services District and has a ‘high’ hazard classification. The dam is primarily used for water storage and has no critical appurtenant structures. It is located on the north side of Reservoir A. The dam and reservoir are about 6.2 miles southeast of the town of Truckee in Placer county. The height of the earthen dam is 93 ft., while the length is 516 ft. There is a spillway on the north west corner of the dam. The reservoir capacity is 180 acre-feet. There are no upstream or downstream dams within the study area. Jurisdictions affected include the local county road maintenance department, local water purveyor, local county telephone, and PG&E.

Past Occurrences

There has been no federal or state disaster declarations for dam failure in the County. The District noted no other dam failure occurrences that have affected the District.

Vulnerability to and Impacts from Dam Failure

Dam failure flooding would vary by community depending on which dam fails and the nature and extent of the dam failure and associated flooding. Impacts to the District from a dam failure flood could include loss of life and injury, flooding and damage to property and structures, damage to critical facilities and infrastructure, loss of natural resources, and all other flood related impacts. Additionally, mass evacuations and associated economic losses can also be significant.

During dam failure, flow will travel north through West Martis Creek and it will inundate Highlands View Road, the first infrastructure impacted, which has a maximum conveyance of approximately 1,800 CFS. Northstar Drive and Basque Drive are also inundated before reaching State Route 267 (SR 267). Basque Drive has a corrugated metal pipe culvert that can only handle a small portion of peak flow; flood flows will overtop Basque Drive. From Basque Drive, flood flows will travel north through the Northstar Golf Course and the enter the Martis Creek Trail and Wildlife Area. Because of the large storage capacity of the Martis Creek Wildlife Area, only a peak flow of 2,360 cfs will pass through Martis Creek Lake and SR267 will not be overtopped.

Assets at Risk

No District assets (from Table L-4) are at risk from this hazard.

Earthquake

Likelihood of Future Occurrence–Occasional

Vulnerability–Medium

Hazard Profile and Problem Description

An earthquake is caused by a sudden slip on a fault. Stresses in the earth’s outer layer push the sides of the fault together. Stress builds up, and the rocks slip suddenly, releasing energy in waves that travel through the earth’s crust and cause the shaking that is felt during an earthquake. Earthquakes can cause structural damage, injury, and loss of life, as well as damage to infrastructure networks, such as water, power, gas, communication, and transportation. Earthquakes may also cause collateral emergencies including dam and

levee failures, seiches, hazmat incidents, fires, avalanches, and landslides. The degree of damage depends on many interrelated factors. Among these are: the magnitude, focal depth, distance from the causative fault, source mechanism, duration of shaking, high rock accelerations, type of surface deposits or bedrock, degree of consolidation of surface deposits, presence of high groundwater, topography, and the design, type, and quality of building construction.

Location and Extent

The amount of energy released during an earthquake is usually expressed as a magnitude and is measured directly from the earthquake as recorded on seismographs. An earthquake's magnitude is expressed in whole numbers and decimals (e.g., 6.8). Seismologists have developed several magnitude scales, as discussed in Section 4.3.11 of the Base Plan. Placer County itself is traversed by a series of northwest-trending faults, called the Foothill Fault Zone, that are related to the Sierra Nevada uplift. This was the source of Oroville's 1975 earthquake (and an earlier event in the 1940s). Subsequent research of these events led to the identification and naming of the zone and questions about the siting and design of the proposed Auburn Dam. Earthquakes on nearby fault segments in the zone could be the source of ground shaking in the Placer County Planning Area.

Although portions of western and eastern Placer County are located in a seismically active region, no known faults actually go through any of the cities or towns. However, the Bear Mountain and the Melones faults are situated approximately three to four miles west and east of the City of Auburn respectively. Earthquakes on these two faults would have the greatest potential for damaging buildings in Auburn, especially the unreinforced masonry structures in the older part of the city and homes built before 1960 without adequate anchorage of framing and foundations. Similar lower magnitude but nearby earthquakes are capable of producing comparable damages in other Placer County communities.

Another measure of earthquake severity is intensity. Intensity is an expression of the amount of shaking at any given location on the ground surface. Seismic shaking is typically the greatest cause of losses to structures during earthquakes. Seismic shaking maps for the area show Placer County and the District fall within a moderate shake risk.

Past Occurrences

There have been no past federal or state disaster declarations from this hazard. The District noted no past occurrences of earthquakes or that affected the District in any meaningful way.

Vulnerability to and Impacts from Earthquake

The combination of plate tectonics and associated California coastal mountain range building geology generates earthquake as a result of the periodic release of tectonic stresses. Placer County lies in the center of the North American and Pacific tectonic plate activity. There have been earthquakes as a result of this activity in the historic past, and there will continue to be earthquakes in the future of the California north coastal mountain region.

Fault ruptures itself contributes very little to damage unless the structure or system element crosses the active fault; however, liquefaction can occur further from the source of the earthquake. In general, newer

construction is more earthquake resistant than older construction due to enforcement of improved building codes. Manufactured buildings can be very susceptible to damage because their foundation systems are rarely braced for earthquake motions. Locally generated earthquake motions and associated liquefaction, even from very moderate events, tend to be more damaging to smaller buildings, especially those constructed of unreinforced masonry (URM) and soft story buildings. The District noted that there are no URM or soft story buildings in the District.

The Uniform Building Code (UBC) identifies four seismic zones in the United States. The zones are numbered one through four, with Zone 4 representing the highest level of seismic hazard. The UBC establishes more stringent construction standards for areas within Zones 3 and 4. All of California lies within either Zone 3 or Zone 4. The NCS&D & FD is within the less hazardous Zone 3.

Impacts from earthquake in the District will vary depending on the fault that the earthquake occurs on, the depth of the earthquake strike, and the intensity of shaking. Large events could cause damages to infrastructure, critical facilities, residential and commercial properties, and possible injuries or loss of life.

The District has never suffered a severe earthquake. However, if an earthquake were severe enough, there is potential to cause widespread destruction. This destruction would be in the form of damage to businesses, private residences, and critical infrastructure including District owned facilities that provide essential services. Since the community of Northstar is a resort community, the shutdown to businesses for long periods due to an earthquake would cause negative impacts to the economy.

Assets at Risk

All of the District assets (from Table L-4) are at risk from this hazard.

Pandemic

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

According to the World Health Organization (WHO), a disease epidemic occurs when there are more cases of that disease than normal. A pandemic is a worldwide epidemic of a disease. A pandemic may occur when a new virus appears against which the human population has no immunity.

A pandemic occurs when a new virus emerges for which people have little or no immunity, and for which there is no vaccine. This disease spreads easily person-to-person, causes serious illness, and can sweep across the country and around the world in a very short time. The U.S. Centers for Disease Control (CDC) and Prevention has been working closely with other countries and the WHO to strengthen systems to detect outbreaks of that might cause a pandemic and to assist with pandemic planning and preparation. An especially severe pandemic could lead to high levels of illness, death, social disruption, and economic loss.

Location and Extent

During a pandemic, the whole of the District, County, and surrounding region is at risk, as pandemic is a regional, national, and international event. The speed of onset of pandemic is usually short, while the duration is variable, but can last for more than a year as shown in the 1918/1919 Spanish Flu. There is no scientific scale to measure the magnitude of pandemic. Pandemics are usually measured in numbers affected by the pandemic, and by number who die from complications from the pandemic.

Past Occurrences

There has been one state and federal disaster declaration due to pandemic, as shown in Table L-5.

Table L-5 Placer County – State and Federal Pandemic Disaster Declarations 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Pandemic	1	2020	1	2020

Source: Cal OES, FEMA

The 20th century saw three outbreaks of pandemic.

- The 1918-1919 Influenza Pandemic (H1N1)
- The February 1957-1958 Influenza Pandemic (H2N2)
- The 1968 Influenza Pandemic (H3N2)

To date, the 21st century has seen two acknowledged pandemics.

- 2009 Swine Flu (H1N1)
- 2019/2020 COVID 19

In response to the initial outbreak of COVID-19 and subsequent shelter in place orders, District management quickly developed protocols to avoid the spread of disease. Due to the essential nature of the work the District performs, Safety personnel were required to continue to report for duty in person.

Operations staff worked on an adapted, rotating schedule until guidelines were in place to prevent the spread of COVID-19 and protect the health and safety of employees. Administrative staff moved to work from home full time, when possible. Administrative staff with an in-office requirement worked in rotating shifts. All in office staff has continued to adhere to cleaning, physical distancing and hand-washing guidelines.

In order to accommodate the shift from in-office to work from home, new in-house policies and procedures were quickly developed and implemented to allow the work processes to continue in an efficient manner and without disruption.

District Board meetings were adapted to a virtual environment via Zoom and the office was and remains closed to the public.

The evolving nature of the pandemic demanded flexibility and adaptability of staff. Pandemic-related policies have been implemented and updated on a continual basis since the onset of COVID-19 and in accordance with federal, state and local laws. This required dedication and attention to several authorities for information to properly communicate, inform and educate staff.

The rate of infection within the District was negligible and there have been no staff to staff transmissions as of April 2021. The fiscal impacts on the District have been insignificant. The District did not reduce staff or pay throughout the pandemic.

Vulnerability to and Impacts from Pandemic

Pandemics have and will continue to have impacts on human health in the region. A pandemic occurs when a new virus emerges for which there is little or no immunity in the human population; the virus causes serious illness and spreads easily from person-to-person worldwide. There are several strategies that public health officials can use to combat a pandemic. Constant surveillance regarding the current pandemic, use of infection control techniques, and administration of vaccines once they become available. Citizens can help prevent the spread of a pandemic by staying home, or “self-quarantining,” if they suspect they are infected. Pandemic does not affect the buildings, critical facilities, and infrastructure in the District. Pandemic can have varying levels of impact to the citizens of the District and greater County, depending on the nature of the pandemic.

Impacts could range from school and business closings to the interruption of basic services such as public transportation, health care, and the delivery of food and essential medicines. Hospitalizations and deaths can occur, especially to the elderly or those with pre-existing underlying conditions. As seen with Covid-19, multiple businesses were forced to close temporarily (some permanently), and unemployment rose significantly. Supply chains for food and essentials can be interrupted.

Assets at Risk

Pandemics do not affect District facilities, but can affect District personnel who operate District facilities.

Severe Weather: Freeze and Snow

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to the NWS and the WRCC, winter snowstorms can include heavy snow, ice, and blizzard conditions. Heavy snow can immobilize a region, stranding commuters, stopping the flow of supplies, and disrupting emergency and medical services. Accumulations of snow can collapse roofs and knock down trees and power lines. In rural areas, homes and farms may be isolated for days, and unprotected livestock may be lost. The cost of snow removal, damage repair, and business losses can have a tremendous impact on cities and towns.

Heavy accumulations of ice can bring down trees, electrical wires, telephone poles and lines, and communication towers. Communications and power can be disrupted for days until the damage can be repaired. Power outages can have a significant impact on communities, especially critical facilities such as public utilities. Even small accumulations of ice may cause extreme hazards to motorists and pedestrians.

Some winter storms are accompanied by strong winds, creating blizzard conditions with blinding wind-driven snow, severe drifting, and dangerous wind chills. Strong winds accompanying these intense storms and cold fronts can knock down trees, utility poles, and power lines. Blowing snow can reduce visibility to only a few feet in areas where there are no trees or buildings. Serious vehicle accidents with injuries and deaths can result. Freezing temperatures can cause significant damage to the agricultural industry.

Location and Extent

Freeze and snow are regional issues, meaning the entire District is at risk to cold weather and freeze events. While there is no scale (i.e. Richter, Enhanced Fujita) to measure the effects of freeze, the WRCC reports that in a typical year, minimum temperatures fall below 32°F on 209.0 days with 0.4 days falling below 0°F in eastern Placer County. Snowfall is measured in depths, and the WRCC reports that average snowfall on the eastern side of the County is 190.7 inches. Freeze and snow have a slow onset and can generally be predicted in advance for the County. Freeze events can last for hours (in a cold overnight), or for days to weeks at a time. Snow event can last for hours or days, and the snow stays all winter in the eastern portion of the County, often with significant snow depths.

Past Occurrences

There has been no federal and one state disaster declarations in the County for freeze and snow, as shown on Table L-6.

Table L-6 Placer County – State and Federal Disaster Declarations from Freeze and Snow 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Freeze	1	1972	0	–

Source: Cal OES, FEMA

The District noted that cold and freeze is a regional phenomenon; events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.3.

Effects to the District from cold and freeze are limited as infrastructure and facilities were constructed with severe mountain environment in mind. Sustained winter power outages of several days have been experienced in the past due to storm activity. A Critical Power Interruption Emergency Response Plan was drafted in February 2020 to better identify and address backup power needs at facilities during extreme weather events.

Vulnerability to and Impacts from Severe Weather: Freeze and Snow

The District experiences temperatures below 32 degrees during the winter months. Freeze can cause injury or loss of life to residents of the District. While it is rare for buildings to be affected directly by freeze, damages to pipes that feed building can be damaged during periods of extreme cold. Freeze and snow can occasionally be accompanied by high winds, which can cause downed trees and power lines, power outages, accidents, and road closures. Transportation networks, communications, and utilities infrastructure are the most vulnerable physical assets to impacts of severe winter weather in the County.

Because the District is located within the Sierras freeze and snow is a normal occurrence. Over the years the District, its property owners and business owners have taken steps as part of normal everyday life to ease the potentially harmful effects of freeze and snow.

Freeze and Snow and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

Assets at Risk

All of the District assets (from Table L-4) are at risk from this hazard. The Critical Power Interruption Emergency Response Plan adequately addresses the hazard.

Tree Mortality

Likelihood of Future Occurrence—Highly Likely

Vulnerability—Medium

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, and contribute to future fuel loads in forests surrounding communities. During extended drought, tree mortality is driven by a build-up in endemic bark beetle populations and exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events.

Location and Extent

Onset of tree mortality events can be relatively fast; however conditions – such as high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas, and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 - 40 dead trees per acre
- Orange depicting 5 -15 dead trees per acre
- Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A number of Placer County areas were designated during this event and the majority of Placer County watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality, along with numerous Tier 1 High hazard “hot spots”. A map of these areas was shown in in Section 4.3.18 of the Base Plan.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015. The District noted that there has been no direct property damage, there still remains the potential from a falling tree on residential, commercial, or other infrastructure. There was also the loss of 1-12 trees per acre. These trees (Conifers) can be considered merchantable timber for residential and commercial properties. Loss of potential revenue and aesthetic values to the community. Funding has been obtained by the Northstar Fire Department through federal, State of California, Placer County and private funding to slow to tree mortality to a manageable level.

Vulnerability to and Impacts from Tree Mortality

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead trees within the wildland urban intermix or wildland urban interface or urban areas therefore pose a greater risk to due to their proximity to residents, businesses, and road, power, and communication infrastructure.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure.

The District noted that tree mortality beyond a manageable level will occur until the following is achieved: 1) Stand density levels are at a historic level; 2) Species ratio is brought back to its historical component; and 3) Occurrence increase is dependent on climactic conditions. For example, consecutive drought years increases mortality. Also, tree mortality is dependent on existing species present. By manipulating the forest back to a pine/fir mix will help rectify the issue.

Assets at Risk

None of the District assets (from Table L-4) are at direct risk from this hazard.

Wildfire

Likelihood of Future Occurrence–Likely
Vulnerability–High

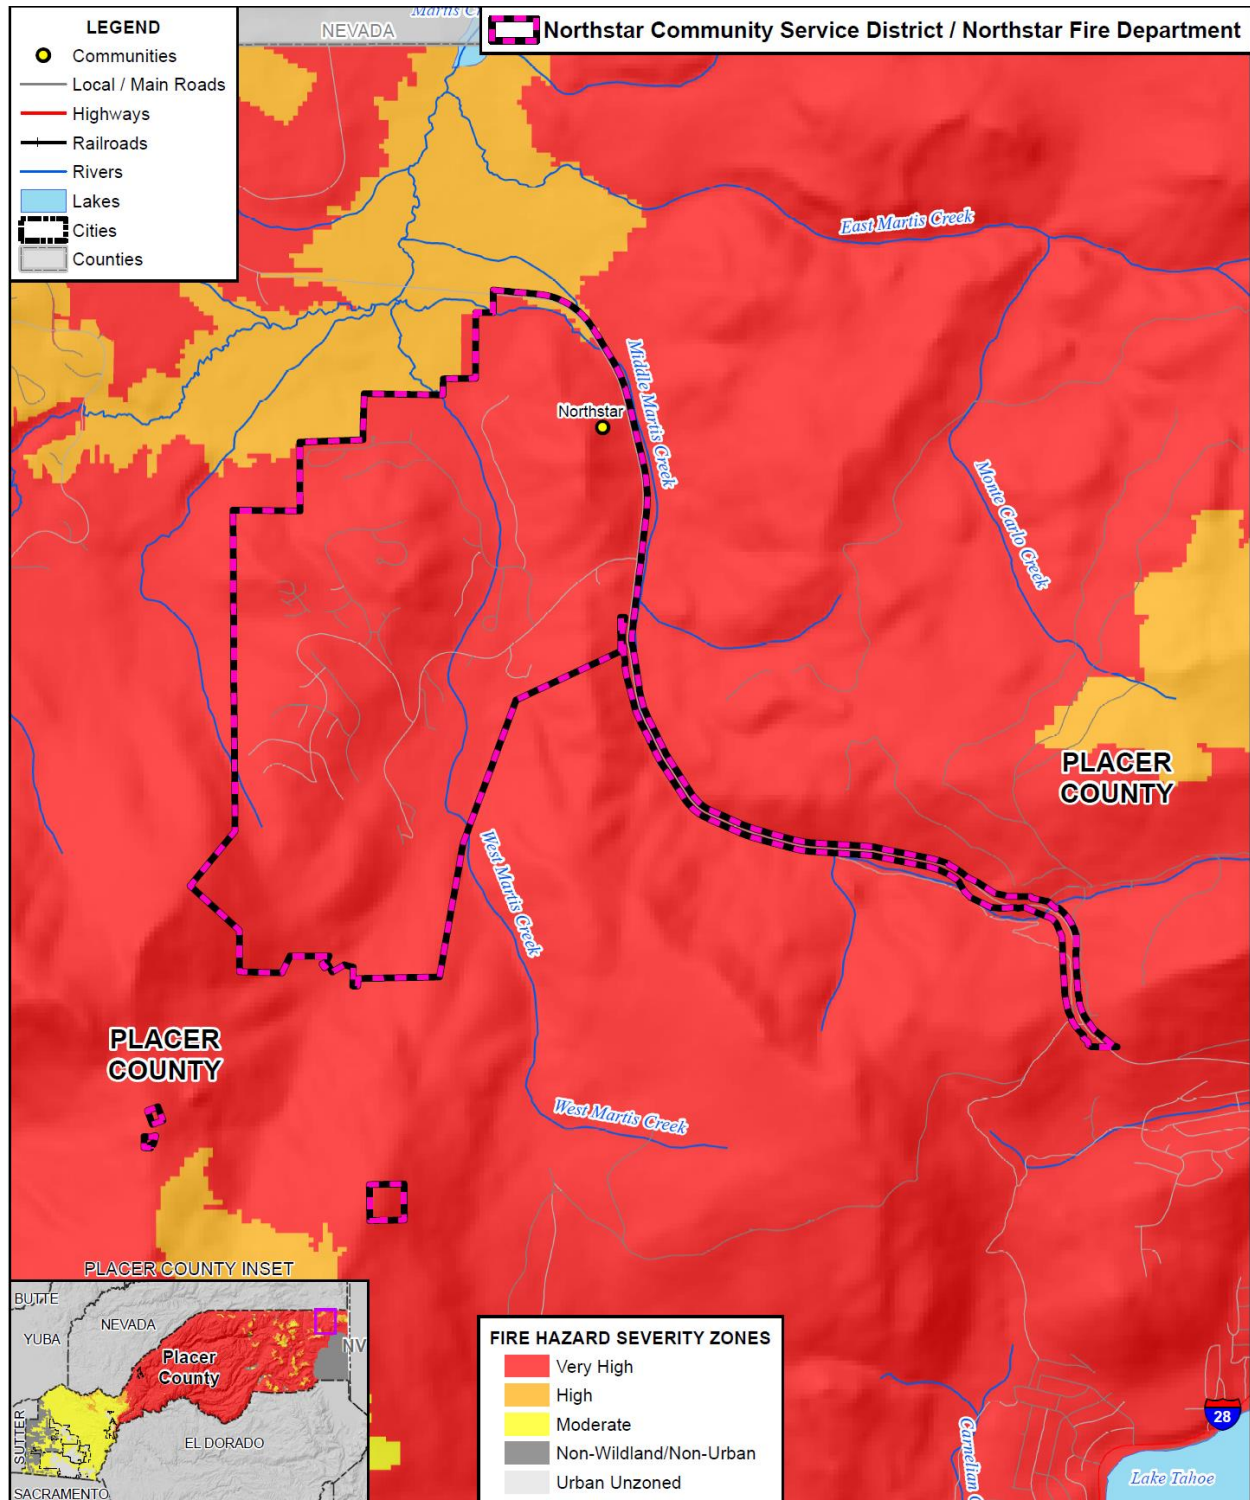

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the NCSD & FD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the NCSD & FD were created. Figure L-3 shows the CAL FIRE FHSZ in the District. As shown on the maps, FHSZs within the District range from High to Very High.

Figure L-3 NCSD & FD – Fire Hazard Severity Zones

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table L-7.

Table L-7 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

The District Forester’s records regarding wildland fire impacts date back to 1967. To his knowledge none of the fire’s listed above created a major impact nor damages to the District and neighboring communities.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat

of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

The District is located in the Sierra Nevada mountain range at the east end of Placer County. The community of Northstar is in a classic Wildland/Urban Interface area (WUI), which adds responsibility and demands to both structural and wildland firefighting. If the District were to experience a major wildland fire the limited emergency response resources would be severely taxed. Northstar is a popular year-round visitor destination, which causes the potential for traffic congestion and could prevent firefighting equipment or medical-emergency personnel from responding in a timely manner. Traffic congestion at peak times of summer could also impact the ability of residents to evacuate in the event of a large scale wildfire.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's energy companies (including PG&E and Liberty Utilities), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Assets at Risk

All facilities from Table L-4 except the TH-1 and TH-2 wells are at risk from this hazard.

L.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

L.6.1. Regulatory Mitigation Capabilities

Table L-8 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the NCSD & FD.

Table L-8 NCSD & FD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	NA	Placer County Authority
Capital Improvements Plan	N/N 2011	Does not address hazard projects identified within the mitigation strategy.
Economic Development Plan	NA	Placer County Authority
Local Emergency Operations Plan	NA	Placer County Authority
Continuity of Operations Plan	Y/N	Currently in process of being developed.
Transportation Plan	NA	Placer County Authority
Stormwater Management Plan/Program	NA	Placer County Authority
Engineering Studies for Streams	NA	Watershed Council Authority
Community Wildfire Protection Plan	Y/Y 2015	Plan addresses hazards and includes mitigation strategy and actions.
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)		
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Y	Version/Year: 2013
Building Code Effectiveness Grading Schedule (BCEGS) Score	NA	Score:
Fire department ISO rating:		Rating: 3
Site plan review requirements	Y	Yes
Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
Zoning ordinance	NA	Placer County Authority
Subdivision ordinance	NA	Placer County Authority
Floodplain ordinance	NA	Placer County Authority
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	Y	Only wildfire. Yes, it is an effective measure and adequately administered.
Flood insurance rate maps	NA	Placer County Authority
Elevation Certificates	NA	Placer County Authority
Acquisition of land for open space and public recreation uses	NA	Placer County Authority
Erosion or sediment control program	NA	Placer County Authority
Other		

How can these capabilities be expanded and improved to reduce risk?

Regulatory mitigation capabilities are effective in mitigation and loss prevention. Capability expansion and improvement is unnecessary at this time.

Source: NCS&D & FD

As indicated above, the District, in conjunction with the County, has several programs, plans, policies, and codes and ordinances that guide hazard mitigation. Some of these are described in more detail below.

Reservoir A Emergency Action Plan (2021)

The purpose of the Reservoir A Dam Emergency Action Plan (EAP) is to reduce the risk of loss of human life or injury and to minimize property damage in the event of a potential or actual emergency situation associated with Reservoir A Dam. These situations include, but are not limited to dam instability, sizable earthquakes, extreme storm events, major spillway releases, overtopping of the dam, outlet system failure, vandalism or sabotage, spillway gate failures, and failure of the dam. This EAP defines the responsibilities and provides procedures to identify and effectively address unusual and unlikely conditions that may endanger the Reservoir A Dam and nearby areas in time to take mitigating actions and notify the appropriate emergency management officials.

Capital Replacement Plan (2018)

With approximately \$191 million in assets, the District’s water, sewer, solid waste, fire, fuels, snow removal, road maintenance and trails services are very asset intensive businesses. The infrastructure, facilities and equipment comprising these assets are critical in ensuring the delivery of quality service. Comprehensive management of assets is a key goal of the District, and is core to the mission of sustainable, long term delivery of services. Part of the District’s asset management strategy is to develop a model forecasting the full lifecycle rehabilitation and replacement costs with a related funding program for its assets with the goal of ensuring consistent service in the most economical manner in balance with generational fairness.

The purpose of this Capital Replacement Plan (CRP), with supporting appendices, is to fully document the District’s facilities, equipment and infrastructure capital replacement needs over a modelled period of 100 years, and to provide a detailed financial analysis for each of the District’s service funds to assist in setting annual capital reserve account contribution goals.

The District has developed this CRP as a living document to set a foundation for fiscal stewardship. It is primarily derived from the District’s GIS based asset management system with a wide array of industry standard metrics and engineering solutions providing the guiding methodology for the model output. This data was used in conjunction with District policies to develop specific funding programs for each service.

Northstar Community Wildfire Protection Plan, 2015 (Being updated in 2021)

The objective of this Community Wildfire Protection Plan (CWPP) is to reduce or eliminate the loss of life, property and resources caused by a wildfire in the Northstar community. This will be accomplished through public input, planning and forest management practices. The first line of defense against a catastrophic wildfire in Northstar is to prevent as many fires as possible from starting or, in the event of a fire, to keep

it as small as possible. The second line of defense is to enforce defensible space requirements around structures and to manage fuels in common and boundary areas by creating firebreaks, safe escape routes and promoting a healthy forest ecosystem. The CWPP puts goals and actions together to reduce wildfire risk to residents in the Northstar community.

Ordinance 26-09 – Wildland Fire Prevention and Defensible Space

Fires pose a serious threat to the preservation of the public peace, health and safety, and are extremely costly. Since fires ignore civil boundaries, it is necessary that cities, counties, special districts, state agencies, and federal agencies work together to minimize the threat of fires and maximize the ability to extinguish them quickly. Preventive measures are therefore needed to insure the preservation of the public peace, health, and safety.

The purpose of this Ordinance is to:

- Classify lands within the District in accordance with whether a high fire hazard is present so that District officials and others with similar wildland fire prevention and suppression responsibility are able to identify measures that will retard the rate of spread and reduce the potential intensity of uncontrolled fires that threaten to destroy natural resources, life or property.
- Require that the measures be implemented in order to accomplish the following:
 - ✓ Set maintenance standards
 - ✓ Define penalties for violation of this Ordinance

The District hereby specifically and expressly finds that regulations contained herein are reasonably necessary because of local climatic, geological and topographical conditions unique to the Northstar area and are further required to reduce the possibility of a fire originating within the District from spreading to the adjacent Lake Tahoe Basin, an area of national importance and significance.

Future Construction in Wildfire Zones

Due to potential wildfire hazard, developers must follow an established ordinance that dictates that all new construction must have certain “buffer” zones. For example, the developer must construct a 300’ buffer zone (implementing fuels management operations) in and around development (both residential and commercial). Additionally, the developer must create a 5’ non-combustible buffer zone around developed property.

Ordinance 35-19 is an updated version of the ordinance above. It will be included in the annex packet.

Critical Power Interruption Emergency Response Plan

The District’s facilities and water and sewer systems are dependent on electrical power. Although all facilities have been designed to withstand the effects of short duration power losses, severe weather and Public Safety Power Shutoffs (PSPS) present a potential problem in that the power disruptions could last several days. This plan identifies all backup power systems for District facilities and provides considerations for keeping systems operational during extended outages.

L.6.2. Administrative/Technical Mitigation Capabilities

Table L-9 identifies the District department(s) responsible for activities related to mitigation and loss prevention in NCSD & FD.

Table L-9 NCSD & FD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	NA	Placer County
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	The maintenance of clearing drainage systems is the responsibility of Placer County. Northstar Community Services District works closely with Placer County to coordinate this effort.
Mutual aid agreements	Y	Northstar Fire Department is party to several mutual aid agreements.
Other		
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	NA	Placer County responsibility
Floodplain Administrator	NA	
Emergency Manager	NA	
Community Planner	NA	Placer County responsibility
Civil Engineer	Y FT	Staff is trained on regulation and mitigation. There is effective coordination between agencies and staff.
GIS Coordinator	Y FT	Staff is trained on regulation and mitigation. There is effective coordination between agencies and staff.
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	NIXLE, DOT Signage, Fire Danger Signs, Reverse 911, District Siren, Website with Emergency Updates/Postings
Hazard data and information	Y	Coordinated with Placer County Environmental Health
Grant writing	Y	Forester and one staff person are responsible for grant writing pertaining to Fuels Reduction Program, and fire operations.
Hazus analysis	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Administrative and technical mitigation capabilities are effective in mitigation and loss prevention. Capability expansion and improvement is unnecessary at this time. If in the future it becomes necessary, the District will work to expand its capabilities.		

Source: NCSD & FD

L.6.3. Fiscal Mitigation Capabilities

Table L-10 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table L-10 NCSD & FD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Capital improvement projects are typically projects that replace existing assets. Funding for mitigation projects is at the discretion of the Board of Directors.
Authority to levy taxes for specific purposes	Y	Yes. Measure "E" was used to fund fuels reduction and road improvements.
Fees for water, sewer, gas, or electric services	Y	District enterprise funds include water, sewer, and solid waste. The District is currently researching the potential to allocate a portion of these funds to fuels reduction.
Impact fees for new development	Y	The fire department assesses mitigation fees for new development.
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	Up to this point, the incurring of debt has only been used to help fund the new Admin Building. Depending on the type of mitigation project special tax bonds and general obligation bonds could be utilized.
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	Y	Federal grants have been awarded for past forestry projects that reduce forest fuels to prevent catastrophic wildfires.
State funding programs	Y	Forestry grants that reduce hazardous forest fuels and enhance water sheds.
Other		
How can these capabilities be expanded and improved to reduce risk?		
Forest fuels reduction is looking to potentially increase the parcel tax to help levy funds for additional "on the groundwork and fund a full time Forestry Assistant.		

Source: NCSD & FD

L.6.4. Mitigation Education, Outreach, and Partnerships

Table L-11 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table L-11 NCSD & FD’s Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	Homeowner's Newsletter - articles highlight fire safety, water conservation, and information important to the community. Annual Homeowner's Meetings presentations are given on fire safety, defensible space, and fuels reduction program. Fire Extinguisher training is offered by District employees multiple times throughout the year for local Annual Fire Prevention/Inspections of Commercial Properties – Inspections are provided within a focus on educating business owners of fire code requirements. District Water Conservation Program - A Conservation Ordinance has been adopted. There are educational efforts to all property owners on the benefits of water conservation, the District has installed smart meters so property owners can monitor water usage, the District has installed a conservation garden to encourage water wise landscape.
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	Y	Recognized FireWise community
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Firewise is a nationally recognized program which benefits members of a community through fire education and participation. Additionally, Firewise assists in obtaining wildfire insurance/discounts and is beneficial in the grant application process.		

Source: NCSD & FD

L.6.5. Other Mitigation Efforts

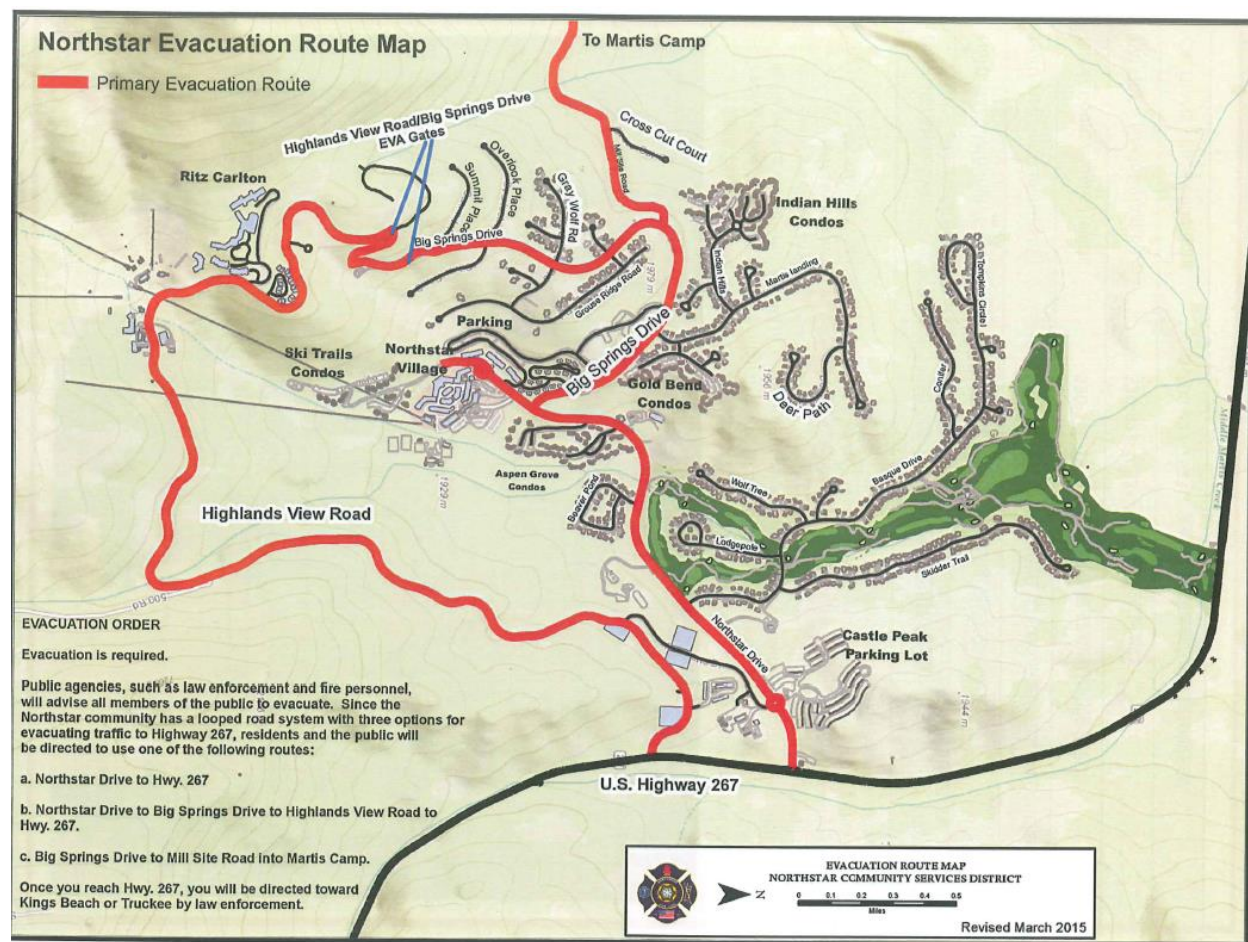

The Northstar Community Services District has many other mitigation efforts. Some of these were captured in the tables above, but are discussed in greater detail below.

- **Firewise Community:** The District became recognized as a Firewise Community in 2009. Since then, the NFD has continually worked with many of our community leaders towards maintaining such eligibility. The Firewise program is nationally-recognized. The NFD, in conjunction with Northstar Property Owners Association (NPOA), Condominium Association Management Company (CAMCO),

Vail Resorts, and Mountainside Partners are providing resources aimed at the reduction of fuels to create better defensible space within the Northstar area. There are many benefits to becoming a Firewise community; we gain an edge on securing grants and Federal funding for defensible space projects. The program is also recognized by certain insurance companies which offer a discount to property owners who reside within a Firewise community.

- Fuels Reduction Program: A program that is overseen by a full-time Forester that executes fuels management/forest health projects with the emphasis on reducing excess fuels, reduce the potential for insect and disease infestations and restore the forest back to healthy historical standards. The program offers the necessary resources and staffing for such projects. This program was created in order to meet the strategic initiatives found in our District's Community Wildfire Protection Plan (CWPP).
- Defensible Space Program: A program that is overseen by a full-time Fire Prevention Officer that requires all homeowners to maintain their property in compliance with Public Resources Code (PRC) 4291, California Code of Regulations (CCR) 1299 and Northstar Ordinance 35-19 guidelines.
- Fire Hydrant Maintenance Program: A program that seeks to keep all fire hydrants operable to the fullest measure. The program institutes annual inspections and maintenance involving flow/pressure testing, flushing, repairs and re-painting.
- Green Waste Recycling Program: A program created to help homeowners with defensible space compliance. This program is being revamped for 2021. The District has allocated \$25,000 annually to reimburse residents for 6-yd³ green waste dumpster rentals. In addition, 30-yd³ dumpsters will be provided on Memorial Day, July 4th and Labor Day for residents to dispose of green waste.
- With the ensuing development of the Highlands area, new roads were constructed (i.e. Highlands View Road and Shaffer Mill Road connector) – thus, allowing for additional means of ingress and egress in case of evacuation due to catastrophic events. This is shown in Figure L-4.

Figure L-4 Northstar CSD - Evacuation Routes

Source: Northstar CSD

- Deer Path Water Course Relocation Project. The original water course that day lighted above the Martis Landing homes was relocated to a new channel. The original drainage inlet was removed. A new inlet was installed further downstream, and all water tied into the larger storm water system.
- Wolf Tree Storm Water Extension. The original storm water system day lighted itself at the property line. This was problematic as it would wash out our sewer access road and find a water course through a lower residence on Basque. This storm water drainage was extended, and a culvert installed under the sewer access road. It now day lights above the golf course as a dissipater was installed to encourage sheet flow onto the golf course fairway.
- Easement Access Road Water Bar Maintenance and Replacement Program. Annually, the Utilities Department maintains the water bars on all of our access roads. An assessment of effectiveness is done at the same time. The purpose of the water bars is to encourage sheet flow and dissipate energy. Areas deemed to have unnecessary or ineffective water bars are terminated and areas deemed useful are added.
- Storm Water Drainage Inlet Maintenance. Technically, storm drainage inlets are Placer County's responsibility. Placer County is not always able to get all of our D.I.'s on an annual basis. And, in many areas, this is necessary. The Utilities Department ensures that all D.I.'s within the District boundaries are clean of debris and able to flow storm water in the case of a serious event. Such work is performed using the District-owned Vac-Con truck.
- Storm Events. During a storm event where the precipitation is in the form of rain (not snow), the Utilities Department uses part of its crew to clean D.I. grates to ensure water is flowing into its proper

channels. In some instances, water must be diverted to avoid it cutting its own course in a less desirable path. Equipment used for this task includes simple hand tools such as: shovels and rakes. However, the Vac-Con truck, backhoe, loaders or graders can be used when deemed necessary.

L.7 Mitigation Strategy

L.7.1. Mitigation Goals and Objectives

The NCS&D & FD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

L.7.2. Mitigation Actions

The planning team for the NCS&D & FD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Dam Failure
- Earthquake
- Pandemic
- Severe Weather: Freeze and Snow
- Tree Mortality
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Tree Mortality

Hazards Addressed: Tree Mortality

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The Northstar Fire Department’s Forest Fuels Management Department has been working towards reducing tree mortality within and outside the District boundary. Tree mortality has accelerated from drought cycles, climate change, insects, and disease. Tree mortality has increased forest fuels accumulations and created a public safety/infrastructure hazard. Tree mortality can be identified as dead, dying, diseased or pest infected. In the last 10-years tree mortality has increased to a level that must be mitigated before tree mortality becomes at an epidemic level.

Project Description: The Forest Fuels Management tracks and identifies tree mortality on a year-round schedule. Once a tree is identified for removal it is prioritized based on the severity of mortality and the hazard it possesses. Tree mortality used to address in the spring and fall months with a fixed budget. Now tree mortality must be addressed year-round.

Other Alternatives: There are no alternatives being that this is a priority public safety/forest health project.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Community Wildfire Protection Plan, Forest Fuels Modeling, Field Reconnaissance

Responsible Agency/ Department/Partners: Northstar Fire Department/Forest Fuels Management

Cost Estimate: Has increased from \$25,000 annually to an estimated \$100,000.

Benefits (Losses Avoided): Public safety, structure protection, and protection of infrastructure

Potential Funding: District and grant funding

Timeline: 7-years to be in a maintenance mode

Project Priority (H, M, L): High

Action 2. Wildfire Mitigation

Hazards Addressed: Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The Northstar Fire Department’s Forest Fuels Management Department has been reducing hazardous forest fuels within and outside the Northstar Community Services District (NCSD & FD) boundary since the inception of the program in 2008. To date the Forest Fuels Management program has treated a total of 1,458 acres within and outside the Northstar Community Services District Boundary. Project areas have received one or more treatments with the intention of having the entire NCSD & FD boundary in a “Maintenance Mode”. A total of 1.7 million dollars has been applied towards treatment through district, State of California, federal and Placer County funding.

The goal is to treat forested acres within and 300’ outside the district boundary to mitigate wildfire behavior to a level that firefighting can make a defensive stand, protect structures, safely evacuate a community and protect human lives.

Prioritization of project areas is guided by the Community Wildfire Protection Plan (CWPP), forest fuels modeling and field work. The main priority for forest fuels reduction is enhancing the main, secondary, and tertiary evacuation routes.

To reach the goal it is estimated that it will take another 7-years and adequate funding to accomplish this goal.

Project Description: This plan identifies prioritization of treatment areas for Forest Fuels Reduction based on guidance of the Community Wildfire Protection Plan.

Other Alternatives: There are no alternatives being that this is a priority public safety project.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Community Wildfire Protection Plan, Forest Fuels Modeling, Field Reconnaissance

Responsible Agency/ Department/Partners: Northstar Fire Department/Forest Fuels Management

Cost Estimate: \$2,100,000

Benefits (Losses Avoided): Public safety, structure protection, and protection of infrastructure

Potential Funding: District and grant funding

Timeline: 7-years to be in a maintenance mode

Project Priority (H, M, L): High

Action 3. Critical Power Interruption Emergency Response Plan

Hazards Addressed: Severe Weather: Freeze and Snow; Wildfire, Pandemic, Earthquake

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The District's facilities and water and sewer systems are dependent on electrical power. Although all facilities have been designed to withstand the effects of short duration power losses, Public Safety Power Shutoffs (PSPS) present a potential problem in that the power disruptions could last several days. Liberty Utilities began implementing PSPSs in summer 2019 to protect public safety by reducing the threat of catastrophic wildfire when gusty winds and dry conditions are forecasted.

Public Safety Power Shutoffs have the potential to occur with regularity during the fire season (May through November). An analysis of the District's resistance to these events is necessary to identify potential power backup deficiencies as well as to plan for specific operational considerations to implement during the events. Sustained winter power outages of several days have also been experienced in the past due to storm activity, and further preparation for these disturbances is desired.

Project Description: This plan identifies all backup power systems for District facilities and provides considerations for keeping systems operational during extended outages.

Other Alternatives: No alternatives identified.

Existing Planning Mechanism(s) through which Action Will Be Implemented: N/A

Responsible Agency/ Department/Partners: NCSD & FD

Cost Estimate: Work to prepare plan was performed in-house at no outside costs.

Benefits (Losses Avoided): By identifying critical operational considerations for facilities with backup power, NCSD & FD is better equipped to mitigate the risk of extended power outages incurred during severe weather.

Potential Funding: Internal labor funded via Engineering allocation for district funds.

Timeline: Completed February 2020

Project Priority (H, M, L): High

Action 4. Emergency Action Plan – Reservoir A Dam

Hazards Addressed: Dam Failure

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The purpose of the Reservoir A Dam Emergency Action Plan (EAP) is to reduce the risk of loss of human life or injury and to minimize property damage in the event of a potential or actual emergency situation associated with Reservoir A Dam.

These situations include, but are not limited to dam instability, sizable earthquakes, extreme storm events, major spillway releases, overtopping of the dam, outlet system failure, vandalism or sabotage, spillway gate failures, and failure of the dam.

Project Description: The EAP defines the responsibilities and provides procedures to identify and effectively address unusual and unlikely conditions that may endanger the Reservoir A Dam and nearby areas in time to take mitigating actions and notify the appropriate emergency management officials.

The Department of Water Resources (DWR), Division of Safety of Dams (DSOD) has rated the Reservoir A Dam as “High” based on hazard classification. Because of its hazard classification, Northstar Community Services District developed the EAP in accordance with the requirements listed in California Water Code Sections 6160 and 6161 and Government Code Section 8589.5, following FEMA’s Federal Guidelines for Dam Safety: Emergency Action Planning for Dams (FEMA 64/July 2013).

Other Alternatives: No alternatives identified.

Existing Planning Mechanism(s) through which Action Will Be Implemented: N/A

Responsible Agency/ Department/Partners: NCSD & FD

Cost Estimate: Work to prepare the EAP and corresponding Inundation Mapping was recently completed for \$26,528

Benefits (Losses Avoided): By identifying affected areas, NCSD & FD is better equipped to mitigate the risk of dam failure.

Potential Funding: Funded via the District's water fund and in partnership with Vail Resorts.

Timeline: Completed March 2021

Project Priority (H, M, L): High

Annex M North Tahoe Fire Protection District

M.1 Introduction

This Annex details the hazard mitigation planning elements specific to North Tahoe Fire Protection District (North Tahoe FPD), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to North Tahoe FPD, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

M.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table M-1. Additional details on plan participation and District representatives are included in Appendix A.

Table M-1 North Tahoe FPD – Planning Team

Name	Position/Title	How Participated
Steve Leighton	Acting Fire Chief	High level oversight, review and approval of NTFPD’s LHMP update
Steve McNamara	Division Chief/Fire Marshal	Oversight for the update: Provided edits, updates and information related to past occurrences, vulnerability, capabilities, district information. Verified hazard id table, Guided updates to and development of new action items.
Sarah Lagano	Battalion Chief	Provide edits, updates and new information related to past occurrences, and mitigation actions related to GIS and IT.
Scott Sedgwick	Battalion Chief	Provide edits, updates and new information related to past occurrences, and mitigation actions related to Pandemic
Nikki Wagner	Captain	Provide edits, updates and new information related to past occurrences, and mitigation actions related to water infrastructure(hydrant) improvements
Brent Armstrong	Captain	Provided NFIRS incident data for use in this plan, and insights relating to wildland fire response.
William Marshman	Firefighter	Provide edits, updates and new information related to past occurrences, and mitigation actions related to communications, and radio systems

Name	Position/Title	How Participated
Eric Horntvedt	Forest Fuels Coordinator	Coordinate and lead NTFPD's LHMP update: Attend meetings, provide general edits and updates to past annex, hazard id table, mitigation actions, vulnerability and capability info, and map. Solicit additional information from NTFPD planning team members.
Erin Holland	Public Information Officer	Co-lead NTFPD's LHMP Update: Attend meetings, general edits and updates to past annex, mitigation actions, manipulate NFIRS data, solicit additional information from NTFPD planning team members

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the District integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the District incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table M-2.

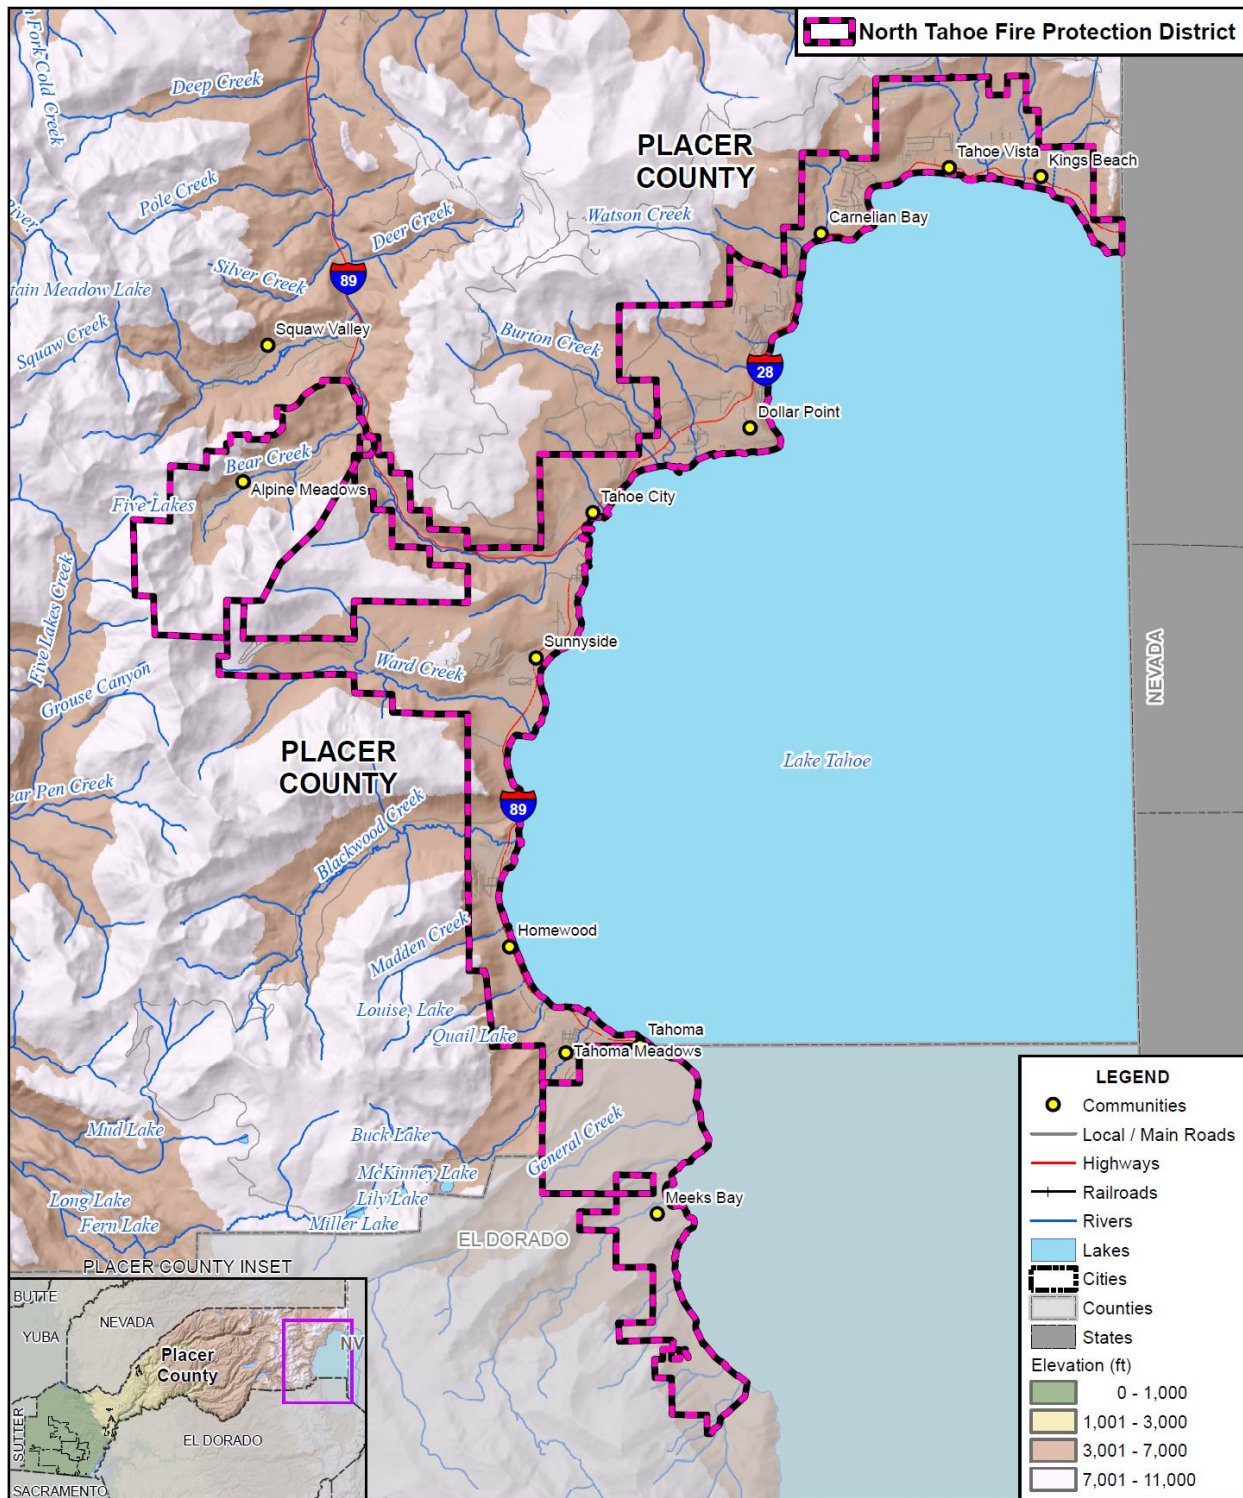

Table M-2 2016 LHMP Incorporation

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
2015 Lake Tahoe Basin CWPP	Section 5.3.5 of the 2015 CWPP recognizes the inclusion of Local Hazard Mitigation Plans that have identified wildfire as a hazard and provide for mitigation actions to reduce the risk of catastrophic fire
Placer Emergency Operations Plan (2017)	The EOP used the LHMP as a basis for hazards to plan for.
DRAFT Lake Tahoe Climate Adaptation Action Portfolio (CAAP)	LHMP is not specifically addressed in the “Integrated Vulnerability Assessment of Climate Change in the Lake Tahoe Basin” but it was recommended to be included (along with CWPP) in the developing Climate Adaptation Action Portfolio to show agency commitments to mitigating the risks associated with natural hazards.
Pre-Attack Plans	LHMP is informally incorporated as Pre-attack plans are in place to plan for response to hazards.

M.3 District Profile

The District profile for the North Tahoe FPD is detailed in the following sections. Figure M-1 displays a map and the location of the District within Placer County.

Figure M-1 North Tahoe FPD

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

M.3.1. Overview and Background

North Tahoe Fire Protection District (NTFPD) is an all-risk career fire district that protects various communities within two counties on the north and west shores of Lake Tahoe, North America's largest alpine lake. The district's service area covers over 40 square miles and over 20 miles of shoreline. The district is entirely within the unincorporated areas of Placer and El Dorado Counties. The district's mission is to provide the highest possible level of fire, rescue, and pre-hospital emergency medical services and ambulance transport, as well as prevention and education to the residents and visitors of the communities served.

NTFPD personnel are trained to respond to events such as structure and wildland fires, technical rescue operations, confined space operations, ice/swift water/back country rescues, and mitigation of hazardous materials incidents. NTFPD's service area consists of eight fire stations, five of which are staffed fulltime (24/7/365), and we are a career fire department with 51 uniformed Fire/EMS personnel and operate a daily minimum staffing of 12 firefighters. In addition to the District's formal service area, consisting of over 17,000 housing units and over 1,000 businesses spanning 27.5 square miles, the District provides service via long-term contract to the Alpine Meadows community, consisting of 750 housing units in Placer County, and the Meeks Bay community, consisting of 2,800 housing units spanning 14 square miles. The Meeks Bay community includes over 2,000 acres of state park and federal forest land. According to an audit-certified tax base valuation for 2020, District personnel protect an assessed valuation of \$9.3 billion dollars in our combined service area, \$8.1 billion of which is in Placer County.

The district's service area ranges from 6,000 feet – 9,000 feet in elevation, and at 80 miles from the county seat, is geographically isolated and vulnerable to natural disasters such as severe winter storms, avalanches, high mountain passes, flooding, landslides, and wildland fires, which leave the region dependent upon local agencies for emergency incident response on our two-lane roads that are frequently gridlocked with seasonal traffic.

Hotels, lodges, and vacation home rentals are located throughout our service area, resulting in our population increasing from 17,000 fulltime residents to over 75,000 people during peak seasons, nearly five times the resident population, which creates an additional 10-20% increase in calls for service daily. These numbers do not reflect the overall Lake Tahoe tourist population traveling through our community, whose safety is also impacted by these local hazards. An analysis performed by Stantec using cell phone data purchased from Air Sage for three months in 2014 — February, July, and August — arrived at a statistic of visitors entering the Tahoe Basin 24.4 million times. This number can range from 19.5–29 million visitors in any given year. The 2014 data also showed that winter and summer day use accounted for 42 to 43 percent of that figure, the balance of those entering staying at least one night.

The district is always available to supply personnel, equipment, and expertise to neighboring departments in California and Nevada. Through mutual and automatic aid agreements, the district assists other local, county, and federal agencies, indirectly covering more than 200 square miles and responding to an average of 200 out-of-district calls each year. As an example, in 2020 district staff responded to 14 major California wildfires that were declared federal disasters, including the North Complex/Zogg, the Red Salmon Complex, and the SCU Lightning Complex Fires.

M.4 Hazard Identification

North Tahoe FPD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table M-3).

Table M-3 North Tahoe FPD —Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Limited	Highly Likely	Critical	Low	Medium
Avalanche	Limited	Highly Likely	Limited	Medium	Medium
Climate Change	Extensive	Likely	Limited	Medium	–
Dam Failure	Significant	Unlikely	Critical	Low	Medium
Drought & Water Shortage	Extensive	Likely	Critical	Medium	High
Earthquake	Extensive	Occasional	Critical	High	Low
Floods: 1%/0.2% annual chance	Limited	Occasional	Critical	Low	Medium
Floods: Localized Stormwater	Limited	Highly Likely	Limited	Medium	Medium
Landslides, Mudslides, and Debris Flows	Limited	Occasional	Limited	Low	Medium
Levee Failure	Limited	Unlikely	Limited	Low	Medium
Pandemic	Extensive	Likely	Catastrophic	Medium	Medium
Seiche	Significant	Unlikely	Critical	Medium	Medium
Severe Weather: Extreme Heat	Extensive	Highly Likely	Limited	Low	High
Severe Weather: Freeze and Snow	Extensive	Highly Likely	Critical	High	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Highly Likely	Critical	High	Medium
Severe Weather: High Winds and Tornadoes	Extensive	High Likely	Critical	High	Low
Tree Mortality	Extensive	Likely	Critical	High	High
Wildfire	Extensive	Highly Likely	Catastrophic	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

M.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District’s hazards and assess the District’s vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

M.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section M.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table M-3) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

M.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District’s total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the North Tahoe FPD’s assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition was refined by separating out three classes of critical facilities as further described in Section 4.3.1 of the Base Plan.

Table M-4 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. North Tahoe FPD’s physical assets, valued at over \$93 million, consist of the buildings and infrastructure to support the District’s operations.

Table M-4 North Tahoe FPD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
Headquarters Station 51	Essential	\$15.6 million	All
Station 52 Kings Beach	Essential	\$13.5 million	All
Station 53 Homewood	Essential	\$10.5 million	All
Station 54 Dollar Point District shop	Essential	\$8.5 million	All
Station 55 Carnelian Bay	Essential	\$8.5 million	All
Station 56 Alpine Meadows	Essential	\$8.5 million	All
Station 67 Meeks Bay	Essential	\$10.5 million	All
Station 68 Tahoma	Essential	\$8.5 million	All
Type 1 Structure Engines X 6	Essential	\$800,000 each	All
Type 3 Brush Engines X 3	Essential	\$500,000 each	All
ALS Ambulances X 6	Essential	\$150,000 each	All
Water Tenders x2	Essential	\$225,000	All
Rescue Vehicles x2 (UTV with Trailer)	Essential	\$50,000	All
Snowmobiles x2 (with trailer)	Essential	\$40,000	All
Loaders x2 (snow removal)	Essential	\$120,000	All
Snowblowers x 9	Essential	\$4,000	All
Generators x7	Essential	\$25,000	All
SCBA Air Trailer x1	Essential	\$35,000	All
Technical Rescue Trailer	Essential	\$8,000	All
Command Vehiclesx5	Essential	\$60,000	All
Utilities x17	Essential	\$40,000	All
Public Info/CERT Trailers x2	Essential	\$8,000	All
Sign Trailers x4	Essential		All
Trailer Chippers x2	Essential		All
Track Chipper x1 (Chipper and flatbed Trailer)	Essential		All
Chipper tow/dump truck x1	Essential		All
Placer Co. Sheriff Dispatch & Office	Essential	-	All
Highways, Bridges, Arterial Roads	Transport/ Lifeline	-	All
Utilities Power, Water, Gas, Sewer, Cell Towers	Transport/ Lifeline	-	All

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
CalTrans & Placer Co. DPW Facilities and Equipment	Transport/ Lifeline	-	All
Lake Tahoe Outlet Dam	High Loss	-	All
Schools and Shelter locations	High Loss	-	All
Groceries stores		-	All
Total		\$93,380,000	

Source: North Tahoe FPD

It is important to note that there are no hospitals within the North Tahoe Fire District boundaries. This becomes a significant vulnerability when the highways become impassable due to flooding, rock/mudslides, avalanches, and interstate closures.

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. North Tahoe FPD provides services to a wide variety of populations with different vulnerabilities. Between the Census and the SHMP, we have statistics showing a high concentration of persons over the age of 65, making for as much as 30% of our population. Approximately 5% of our population is over the age of 75, and with no assisted living facilities, these communities are heavily reliant on neighbors and public safety providers, and as many as 20% of our community are living with a disability. In some communities, as high as 24% of our population are below the poverty level. We have some communities with as high as 30% Limited English Proficiency. As much as 12% of our population are without any type of computing device, and as high as 16% are without internet access. Approximately 5% of our population are without access to a vehicle. In the northern portion of our service area, the community is ranked moderate to high on the Social Vulnerability Index, meaning they are likely to experience the greatest risks and challenges in the event of a disaster.

While this area is home to only about 17,000 residents, during high season some 75,000 people, on any given day, may be enjoying the vast recreational and tourist opportunities. This spike in population creates a unique vulnerability to the area, especially in the event highways become impassable due to flooding, landslides, avalanches, wildfire or gridlocks due to high visitor volume and extreme weather conditions. Even during the off-season, the lack of multiple transportation routes, if closed or compromised, can leave the resident and visitor population cut off from necessary, and potentially life-saving services.

Natural Resources

North Tahoe FPD has a variety of natural resources of value to the District. These natural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan. Additionally, several state or federally listed species may be found within the District boundary. These are identified, along with other species of concern found in the District, in Table M-5.

Table M-5 NTFPD – Summary of Special Status Species

Type	Number
Animals – Amphibians	3
Animals – Birds	13
Animals – Fish	5
Animals – Mammals	8
Animals – Invertebrates	1
Botanical Species	29

Source: Final Tahoe Program Timberland Environmental Impact Report Appendix E, December 2020

Historic and Cultural Resources

North Tahoe FPD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan. Also see Section 3.7 - Archaeological, Historical, and Tribal Cultural Resources of the Tahoe Program Timberland EIR, available at <https://www.ntfire.net/tahoe-pteir>.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Population growth within the North Tahoe FPD continues but is not uniform throughout. The areas within and closest to the developed communities are growing fastest and have higher housing densities. The more rural, mountainous areas are experiencing limited growth, in part due to land ownership, lack of services, and overall rugged terrain. Unique to this part of Placer County is not the growth of full-time residents, but the influx of visitors and tourists to the area, especially during the peak summer and winter seasons. While this area is home to only about 17,000 full time residents, during high season some 75,000 people, on any given day, may be enjoying the vast recreational and tourist opportunities. Real estate volume did by increase 63% in 2020 during the pandemic and stay-at-home orders, and the change in remote work options may result in more growth in the longer term, however school enrollments are not increasing at the same level.

The District does not have a capital replacement plan, and 6 of 7 NTFPD Fire Stations are greater than 40 years old, and do not meet current seismic or building standards. Due to age of facilities and growth of community and organization, these are not meeting current needs.

Development since 2016

No District facilities have been constructed since 2016. As such, a change in vulnerability is unlikely. NTFPD Station 53 in Homewood did receive a complete interior remodel in 2020 to the expense of \$153,000 and there are ongoing capital expenditures for station.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. Most District facilities are old and in need of remodels or complete replacement. The District's shop is insufficient in size and height to work on some of the larger apparatus, and the Prevention and Forest Fuels Division is expected to increase in size and exceed office space at the current headquarter station. More general information on growth and development in Placer County as a whole can be found in "Growth and Development Trends" in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

M.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table M-3 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Avalanche

Likelihood of Future Occurrence—Highly Likely

Vulnerability—Medium

Hazard Profile and Problem Description

According to the Sierra Avalanche Center, avalanches occur when loading of new snow increases stress at a rate faster than strength develops, and the slope fails. Avalanches are a rapid down-slope movement of snow, ice and debris triggered by ground shaking, sound, or human or animal movement. Avalanches consist of a starting zone where the ice or snow breaks loose, a track which is the grade or channel the debris slides down and a run-out zone where the snow is deposited.

Critical stresses develop more quickly on steeper slopes and where deposition of wind-transported snow is common. The vast majority of avalanches occur during and shortly after storms. This hazard generally affects a small number of people, such as snowboarders, skiers, and hikers who venture into backcountry areas during or after winter storms. Roads and highway closures, damaged structures, and destruction of forests are also a direct result of avalanches.

Location and Extent

The two primary factors impacting avalanche activity are weather and terrain. Large, frequent storms deposit snow on steep slopes to create avalanche hazards. Additional factors that contribute to slope stability are the amount of snow, rate of accumulation, moisture content, wind speed and direction and type of snow crystals. Topography also plays a vital role in avalanche dynamics. Slope angles between 30 to 45 degrees are optimal for avalanches. The risk of avalanches decreases on slope angles below 30 degrees. At 50 or more degrees they tend to produce sluff or loose snow avalanches that account for only a small percentage of avalanche deaths and property damage annually.

Areas prone to avalanche hazards include hard to access areas deep in the backcountry and those in the more developed higher elevations of the County in the Tahoe basin. Avalanche hazards exist in eastern Placer County where combinations of the above criteria occur. The District is concerned about the Highway 89 corridor, Alpine Meadows, Ward Canyon, and Emerald Bay.

Past Occurrences

There have been no state or federal disasters in the County related to avalanche. The District noted the following avalanche past occurrences:

- In **1982** a large avalanche occurred in Alpine Meadows and a large avalanche in the 1200-1300 area of Sandy Way with major structural damage to several homes.
- In **1995**, an avalanche hit 2 homes in the 1300 area of Sandy Way, with no injuries and minimal damage to the two homes. We have had some mud slides in 1300 area of Sandy, as well as the 1700 block of Sandy over the years, blocking the road, no injuries or structural damage.
- Since 2015/2016, the District has not experienced any avalanches in Olympic Valley. The District did note an avalanche (thought to be in 2017) on Highway 89 south of Alpine Meadows road (North Tahoe District) that caught a few occupied cars.
- **March 2, 2018** – After heavy snowfall, an avalanche hit the Squaw Valley ski resort on Friday striking five people and sending two people to the hospital with injuries. Five guests were caught in the avalanche, two females and three males. One person had a serious lower body injury and was taken by firefighters to North Tahoe Forest Hospital. Another person was rescued and taken to a Truckee hospital and released a short time later. The other three were unharmed. A skier at the resort said at least three

of those people had to be dug out and that the slide started at the top of the Olympic Lady lift down to a run called Easy Street.

- **January 17, 2020** – A 34-year-old man was killed while skiing Friday morning and another was seriously injured when an avalanche unfurled a wave of snow on a run in the Alpine Meadows ski resort near Lake Tahoe.

Vulnerability to and Impacts from Avalanche

Avalanches occur when the weight of new snow increases stress faster than strength of the snowpack develops, causing the slope to fail. Avalanche conditions develop more quickly on steeper slopes (located in the eastern portions of the County) and where wind-blown snow is common. Avalanche impacts vary, but include risk to property, injury, or death. Avalanches generally affect a few snowboarders, skiers, and hikers who venture into backcountry areas during or after winter storms. Avalanches cause road closures, and can damage structures and forests.

Assets at Risk

The NFPD Station 56 is located in Alpine Meadows as well as roads and ASCWD utilities.

Climate Change

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Climate change adaptation is a key priority of the State of California. The 2018 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state’s infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Location and Extent

Climate change is a global phenomenon. It is expected to affect the whole of the District, Placer County, and State of California. There is no scale to measure the extent of climate change. Climate change exacerbates other hazards, such as drought, extreme heat, flooding, wildfire, and others. The speed of onset of climate change is very slow. The duration of climate change is not yet known, but is feared to be tens to hundreds of years.

Past Occurrences

Climate change has never been directly linked to any declared disasters. While the District noted that climate change is of concern, no specific impacts of climate change could be recalled. The District and

HMPC members did, however, note that in Placer County, the strength of storms does seem to be increasing and the temperatures seem to be getting hotter. Hotter temperatures, combined with recent drought conditions, exacerbates the potential for damaging wildfires.

Vulnerability to and Impacts from Climate Change

The California Adaptation Planning Guide (APG) prepared by California OES and CNRA was developed to provide guidance and support for local governments and regional collaboratives to address the unavoidable consequences of climate change. California's APG: Understanding Regional Characteristics has divided California into 11 different regions based on political boundaries, projected climate impacts, existing environmental setting, socioeconomic factors and regional designations. Placer County falls within the North Sierra Region characterized as a sparsely settled mountainous region where the region's economy is primarily tourism-based. The region is rich in natural resources, biodiversity, and is the source for the majority of water used by the state. This information can be used to guide climate adaptation planning in the District and Placer County Planning Area.

The California APG: Understanding Regional Characteristics identified the following impacts specific to the North Sierra region in which the Placer County Planning Area is part of:

- Temperature increases
- Decreased precipitation
- Reduced snowpack
- Reduced tourism
- Ecosystem change
- Sensitive species stress
- Increased wildfire

In addition to the above, the District noted it is anticipated that Tahoe could become a refuge for those looking to escape hotter conditions in the valleys

Assets at Risk

The District noted that its facilities will most likely not be at risk from climate change.

Drought & Water Shortage

Likelihood of Future Occurrence—Likely

Vulnerability—High

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area's usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate

water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table M-6.

Table M-6 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

The District is experienced a multi-year drought 2014-15 that was part of a much larger drought throughout the western United States. During the most recent drought, the most widespread impact to the District was reduced tree vigor, which lead to an increase in bark beetle populations, white pine blister rust proliferation and widespread tree mortality across primarily White fir, Sugar pine, and Jeffrey pine trees.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended.

Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

Drought prolongs the wildfire season, which increases overtime costs and wear and tear on District equipment, and exacerbates wildland fire risk, frequency and severity by contributing to rapid consumption of tinder dry fuels, leading to increased rate of spread and fire intensity which can exceed initial attack response capabilities and have negative impact to life, property, and the environment.

The HMPC noted that the 2014-2015 drought had impacts in the District. Crop damages were widespread, wildfire risk was increased, and businesses had felt impacts from the drought conditions.

Potential effects of the 2014 multi-year drought included:

- Reduced water for domestic consumption and fire suppression.
- Stress on natural vegetation leading to increased disease and mortality.
- Drought stressed/dead vegetation contributes to increased fire danger and fire behavior, leading to larger more catastrophic wildfire incidents.

Assets at Risk

Water utilities would be the primary asset at risk since NTFPD relies on primarily municipal water supply during fire suppression operations. NTFPD is situated within the WUI intermix and WUI defense zone, so forest health and vigor would be another asset at risk where drought stressed vegetation and the lack of moisture contributes to increased fire danger and behavior and could lead to catastrophic wildfire conditions.

Earthquake

Likelihood of Future Occurrence—Occasional

Vulnerability—High

Hazard Profile and Problem Description

An earthquake is caused by a sudden slip on a fault. Stresses in the earth's outer layer push the sides of the fault together. Stress builds up, and the rocks slip suddenly, releasing energy in waves that travel through the earth's crust and cause the shaking that is felt during an earthquake. Earthquakes can cause structural damage, injury, and loss of life, as well as damage to infrastructure networks, such as water, power, gas, communication, and transportation. Earthquakes may also cause collateral emergencies including dam and levee failures, seiches, hazmat incidents, fires, avalanches, and landslides. The degree of damage depends on many interrelated factors. Among these are: the magnitude, focal depth, distance from the causative fault, source mechanism, duration of shaking, high rock accelerations, type of surface deposits or bedrock, degree of consolidation of surface deposits, presence of high groundwater, topography, and the design, type, and quality of building construction.

Location and Extent

The amount of energy released during an earthquake is usually expressed as a magnitude and is measured directly from the earthquake as recorded on seismographs. An earthquake's magnitude is expressed in whole numbers and decimals (e.g., 6.8). Seismologists have developed several magnitude scales, as discussed in Section 4.3.11 of the Base Plan. Placer County itself is traversed by a series of northwest-trending faults, called the Foothill Fault Zone, that are related to the Sierra Nevada uplift. This was the source of Oroville's 1975 earthquake (and an earlier event in the 1940s). Subsequent research of these events led to the identification and naming of the zone and questions about the siting and design of the proposed Auburn Dam. Earthquakes on nearby fault segments in the zone could be the source of ground shaking in the Placer County Planning Area.

Although portions of western and eastern Placer County are located in a seismically active region, no known faults actually go through any of the cities or towns. However, the Bear Mountain and the Melones faults are situated approximately three to four miles west and east of the City of Auburn respectively. Earthquakes on these two faults would have the greatest potential for damaging buildings in Auburn, especially the unreinforced masonry structures in the older part of the city and homes built before 1960 without adequate anchorage of framing and foundations. Similar lower magnitude but nearby earthquakes are capable of producing comparable damages in other Placer County communities.

Another measure of earthquake severity is intensity. Intensity is an expression of the amount of shaking at any given location on the ground surface. Seismic shaking is typically the greatest cause of losses to structures during earthquakes. The District is located in an area where earthquakes of significant magnitude can occur, so both magnitude and intensity of earthquakes are expected to be moderate. Seismic shaking maps for the area show Placer County and the District fall within a moderate shake risk.

Past Occurrences

There have been no past federal or state disaster declarations from this hazard. The District noted no past occurrences of earthquakes or that affected the District in any meaningful way.

Vulnerability to and Impacts from Earthquake

The combination of plate tectonics and associated California coastal mountain range building geology generates earthquake as a result of the periodic release of tectonic stresses. Placer County lies in the center of the North American and Pacific tectonic plate activity. There have been earthquakes as a result of this activity in the historic past, and there will continue to be earthquakes in the future of the California north coastal mountain region.

Fault ruptures itself contributes very little to damage unless the structure or system element crosses the active fault; however, liquefaction can occur further from the source of the earthquake. In general, newer construction is more earthquake resistant than older construction due to enforcement of improved building codes. Manufactured buildings can be very susceptible to damage because their foundation systems are rarely braced for earthquake motions. Locally generated earthquake motions and associated liquefaction, even from very moderate events, tend to be more damaging to smaller buildings, especially those constructed of unreinforced masonry (URM) and soft story buildings. According to the CGS, North Tahoe Fire's service area is at the highest risk from earthquake in all of Placer County, and is at the highest point on the index for Earthquake Ground Shaking Potential. All District Stations are vulnerable to earthquake. If damage were caused by an earthquake, it would impact the District's ability to respond and serve the community during the disaster. NTFPD has only one of seven fire stations that was built to seismic standards.

The Uniform Building Code (UBC) identifies four seismic zones in the United States. The zones are numbered one through four, with Zone 4 representing the highest level of seismic hazard. The UBC establishes more stringent construction standards for areas within Zones 3 and 4. All of California lies within either Zone 3 or Zone 4. The North Tahoe FPD is within the less hazardous Zone 3.

Impacts from earthquake in the District will vary depending on the fault that the earthquake occurs on, the depth of the earthquake strike, and the intensity of shaking. Large events could cause damages to infrastructure, critical facilities, residential and commercial properties, and possible injuries or loss of life. No specific studies have been conducted in the local area in regard to the impacts of a large scale earthquake. In general, such an event would result in large scale widespread impacts on a regional level that could include:

- Structural collapse
- Transportation impacts
- Power and communications interruptions
- Structural and wildfire incidents
- Avalanches, mudslides, rock falls and landslides
- Dam failures and flooding
- Seiche Wave Events
- Loss of life and injuries on a large scale

- Economic impacts and business loss

Assets at Risk

All District Stations from Table M-4 are at risk from this hazard, as well as other critical infrastructure facilities.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence—Highly Likely

Vulnerability—Medium

Hazard Profile and Problem Description

Flooding occurs in areas other than the FEMA mapped 1% and 0.2% annual chance floodplains. Flooding may be from drainages not studied by FEMA, lack of or inadequate drainage infrastructure, or inadequate maintenance. Localized, stormwater flooding occurs throughout the County during the rainy season from November through April. Prolonged heavy rainfall contributes to a large volume of runoff resulting in high peak flows of moderate duration.

Location and Extent

The North Tahoe FPD is subject to localized flooding throughout the District. Flood extents are usually measured in areas affected, velocity of flooding, and depths of flooding. Expected flood depths in the District vary by location. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Localized flooding in the District tends to have a shorter speed of onset, especially when antecedent rainfall has soaked the ground and reduced its capacity to absorb additional moisture.

5 of 8 NTFPD facilities are at risk to flooding and stormwater flooding:

- Station 52 (Griff Creek Floodplain and FEMA Flood Hazard Area)
- Station 53 (immediately adjacent to FEMA Flood Hazard Area)
- Station 55 (Adjacent to Carnelian Creek Floodplain)
- Station 56 (directly adjacent to Bear Creek & Truckee River Floodplain)
- Station 67 (Meeks Creek Floodplain)

Other areas of concern:

- HWY 89/Truckee River corridor
- Alpine Meadows and Bear Creek
- Griff Creek
- Watson Creek
- Dollar Creek
- Burton Creek
- Snow Creek Pond (Moon Dunes)
- Ward Creek
- Blackwood Creek

- Madden Creek
- McKinney Creek
- General Creek
- Meeks Creek
- Eagle Creek/Eagle Falls

Past Occurrences

There have been no federal or state disaster declarations in the County due to localized flooding. The District noted the following past occurrences of localized flooding:

- In **1997** the District experienced areas of flooding and landslides related to El Nino resulting in hazardous conditions and road closures. Impacts were to the Highway 89 corridor between Tahoe City and Truckee and the Ward Canyon area on the west shore of Lake Tahoe. Future such events could impact many areas of the district and surrounding areas.
- **2016/17** Winter - The 2016/2017 was a heavy winter, beginning with atmospheric river snow events as early as October, followed by wind events and flash flooding, seemingly nonstop through spring. The statistics are not available for 2016, however the first two months of 2017 saw North Tahoe Fire responding to 135 downed powerlines as a result of the storm/wind/flood cycle, and after just one of these storms, crews responded to at least three buildings, weakened or collapsed. In addition to flooding roadways, powerlines downed due to flood and winds may also be downed in a manner that blocks the roadways. Placer County had a state and federal declaration due to flooding in 2017.
- **2017/2018** Winter - January 2018 saw similar storm activity causing downed powerlines.
- **2018/19** Winter - December 2018 saw similar storm activity causing downed powerlines.

Vulnerability to and Impacts from Localized Flooding

Historically, much of the growth in the District and County has occurred adjacent to streams, resulting in significant damages to property, and losses from disruption of community activities when the streams overflow. Additional development in the watersheds of these streams affects both the frequency and duration of damaging floods through an increase in stormwater runoff.

Primary concerns associated with stormwater flooding include life safety issues, and impacts to property and to infrastructure that provides a means of ingress and egress throughout the community. Ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Objects can also be buried or destroyed through sediment deposition. Floodwaters can break utility lines and interrupt services. Standing water can cause damage to crops, roads, and foundations. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

Assets at Risk

District Stations are at risk to Localized flooding.

Pandemic

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to the World Health Organization (WHO), a disease epidemic occurs when there are more cases of that disease than normal. A pandemic is a worldwide epidemic of a disease. A pandemic may occur when a new virus appears against which the human population has no immunity.

A pandemic occurs when a new virus emerges for which people have little or no immunity, and for which there is no vaccine. This disease spreads easily person-to-person, causes serious illness, and can sweep across the country and around the world in a very short time. The U.S. Centers for Disease Control (CDC) and Prevention has been working closely with other countries and the WHO to strengthen systems to detect outbreaks of that might cause a pandemic and to assist with pandemic planning and preparation. An especially severe pandemic could lead to high levels of illness, death, social disruption, and economic loss.

Location and Extent

During a pandemic, the whole of the District, County, and surrounding region is at risk, as pandemic is a regional, national, and international event. The speed of onset of pandemic is usually short, while the duration is variable, but can last for more than a year as shown in the 1918/1919 Spanish Flu. There is no scientific scale to measure the magnitude of pandemic. Pandemics are usually measured in numbers affected by the pandemic, and by number who die from complications from the pandemic.

Past Occurrences

There has been one state and federal disaster declaration due to pandemic, as shown in Table M-7.

Table M-7 Placer County – State and Federal Pandemic Disaster Declarations 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Pandemic	1	2020	1	2020

Source: Cal OES, FEMA

The 20th century saw three outbreaks of pandemic flu.

- The 1918-1919 Influenza Pandemic (H1N1)
- The February 1957-1958 Influenza Pandemic (H2N2)
- The 1968 Influenza Pandemic (H3N2)

To date, the 21st century has seen two acknowledged pandemics.

- 2009 Swine Flu (H1N1)
- 2019/2020 COVID 19

Vulnerability to and Impacts from Pandemic

Pandemics have and will continue to have impacts on human health in the region. A pandemic occurs when a new virus emerges for which there is little or no immunity in the human population; the virus causes serious illness and spreads easily from person-to-person worldwide. There are several strategies that public health officials can use to combat a pandemic. Constant surveillance regarding the current pandemic, use of infection control techniques, and administration of vaccines once they become available. Citizens can help prevent the spread of a pandemic by staying home, or “self-quarantining,” if they suspect they are infected. Pandemic does not affect the buildings, critical facilities, and infrastructure in the District. Pandemic can have varying levels of impact to the citizens of the District and greater County, depending on the nature of the pandemic.

Impacts could range from school and business closings to the interruption of basic services such as public transportation, health care, and the delivery of food and essential medicines. Hospitalizations and deaths can occur, especially to the elderly or those with pre-existing underlying conditions. As seen with Covid-19, multiple businesses were forced to close temporarily (some permanently), and unemployment rose significantly. Supply chains for food and essentials can be interrupted.

The Covid 19 pandemic has affected North Tahoe Fire Protection District, but has not kept the District from providing 24 hour, 7 days a week emergency response to our community. Early in the pandemic we instituted Incident and Station Life Directives that were geared to lower exposure risk for all personnel. None of our staff contracted Covid 19 from an exposure while in the offices, stations or by transporting Covid 19 patients to the hospital. We closed our offices to the public, but we continued to meet the needs of our constituents and taxpayers remotely. Some of our administrative staff were able to work from home, our prevention staff was able to stagger shifts, work with proper PPE, and still carry-on essential Fire Prevention duties following all safety guidelines. All District stations remained fully staffed by firefighters and paramedics for emergency response. Going forward we will continue to assess our community's health and monitor our personnel to ensure every effort is being made to reduce our exposure to Covid 19.

Assets at Risk

Pandemics do not affect District facilities, but can affect District personnel who operate District facilities. During a pandemic the District would typically be considered essential which puts staff on the front line and at high-risk for exposure as they work to carry on the mission of the District and serve the community.

Seiche

Likelihood of Future Occurrence–Unlikely

Vulnerability–Medium

Hazard Profile and Problem Description

U.S. Army Corps of Engineers defines seiche as:

- A standing wave oscillation of an enclosed water body that continues, pendulum fashion, after the cessation of the originating force, which may have been either seismic or atmospheric.

- An oscillation of a fluid body in response to a disturbing force having the same frequency as the natural frequency of the fluid system. Tides are now considered to be seiches induced primarily by the periodic forces caused by the sun and moon.
- In the Great Lakes area, any sudden rise in the water of a harbor or a lake whether or not it is oscillatory (although inaccurate in a strict sense, this usage is well established in the Great Lakes area).

Seiches can be generated when the water is subject to changes in wind or atmospheric pressure gradients or, in the case of semi-enclosed basins, by the oscillation of adjacent connected water bodies having a periodicity close to that of the seiche or of one of its harmonics. Other, less frequent causes of seiches include heavy precipitation over a portion of the lake, flood discharge from rivers, seismic disturbances, submarine mudslides or slumps, and tides. The most dramatic seiches have been observed after earthquakes and large landslide events.

Location and Extent

Within Placer County, locations with the highest probability of impact are shore areas of Lake Tahoe from 0 to 30 feet above mean lake water level. This falls in areas served by the District. Speed of onset of seiche is short. The duration of the event tends to be short as well, continuing until the waves naturally dissipate.

Past Occurrences

There have been no state or federal disasters in the County related to seiche. No events of past seiche have affected the District.

Vulnerability to and Impacts from Seiche

Research from the University of Nevada estimates that an earthquake must be at least a magnitude 6.5 to cause a damaging seiche at Lake Tahoe. The two faults directly underneath the lake are considered capable of generating magnitude 7.1 earthquakes. Computer models of seiche activity at Lake Tahoe prepared by the University of Nevada research team estimate that waves as high as 30 feet could strike the shore. These projections suggest largest waves might hit Sugar Pine Point, Rubicon Point and the casinos in South Lake Tahoe. The seiche risk is potentially devastating as hundreds of houses are built along the lake and more than 17,000 people enjoy the Lake Tahoe shoreline every day in the summer.

In the District, a seiche could cause issues with low lying areas of the District.

Assets at Risk

District facilities, apparatus and personnel that are within low lying lakeside areas: Station 52, 53, 55, 67.

Severe Weather: Freeze and Snow

Likelihood of Future Occurrence–Highly Likely

Vulnerability–High

Hazard Profile and Problem Description

According to the NWS and the WRCC, winter snowstorms can include heavy snow, ice, and blizzard conditions. Heavy snow can immobilize a region, trapping residents, stranding commuters, stopping the flow of supplies, and disrupting emergency and medical services. Accumulations of snow can collapse roofs and knock down trees and power lines. In rural areas, homes and farms may be isolated for days, and unprotected livestock may be lost. The cost of snow removal, damage repair, and business losses can have a tremendous impact on cities and towns.

Heavy accumulations of ice can bring down trees, electrical wires, telephone poles and lines, propane lines and communication towers. Communications and power can be disrupted for days until the damage can be repaired, leaving residents at risk of freezing. Power outages can have a significant impact on communities, especially critical facilities such as public utilities. Even small accumulations of ice may cause extreme hazards to motorists and pedestrians.

Some winter storms are accompanied by strong winds, creating blizzard conditions with blinding wind-driven snow, severe drifting, and dangerous wind chills. Strong winds accompanying these intense storms and cold fronts can knock down trees, utility poles, and power lines. Blowing snow can reduce visibility to only a few feet in areas where there are no trees or buildings. Serious vehicle accidents with injuries and deaths can result. Freezing temperatures can cause significant damage to the agricultural industry.

Location and Extent

Freeze and snow are regional issues, meaning the entire District is at risk to cold weather and freeze events. While there is no scale (i.e. Richter, Enhanced Fujita) to measure the effects of freeze, the WRCC reports that in a typical year, minimum temperatures fall below 32°F on 209.0 days with 0.4 days falling below 0°F in eastern Placer County. Snowfall is measured in depths, and the WRCC reports that average snowfall on the eastern side of the County is 190.7 inches. Freeze and snow has a slow onset and can generally be predicted in advance for the County. Freeze events can last for hours (in a cold overnight), or for days to weeks at a time. Snow event can last for hours or days, and the snow stays all winter in the eastern portion of the County, often with significant snow depths.

Past Occurrences

There has been no federal and one state disaster declarations in the County for freeze and snow, as shown on Table M-8.

Table M-8 Placer County – State and Federal Disaster Declarations from Freeze and Snow 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Freeze	1	1972	0	–

Source: Cal OES, FEMA

The District noted that freeze and snow is a regional phenomenon; events that affected the eastern side of the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.3.

Most notably, during the mid-80s, a gas main failure occurred in Carson City, Nevada, causing a major outage throughout the region. This also resulted in an overload of the power utilities in the District, causing failures lasting several days. The District estimates that such outages lasting several days during extreme weather events occur approximately every 2-3 winters.

According to the North Tahoe FPD planning team, major winter storms have routinely cut off transportation routes in the district for hours (as recent as March 2007) to over a week (back in the 1950s), stranding thousands and causing a major impact to services and supplies.

Freeze and snow events affect the District annually. Tahoe is known for major winter storms that cause adverse conditions, traffic delays, vehicle accidents, and temporary road closures annually. In 2017, North Tahoe Fire saw the snowiest January since 1952 in Tahoe City, with 135.5 inches in just one month, compared to the seasonal total from July 1, 2015 through June 30, 2016, which was 140 inches. That series of storms resulted in residents trapped in homes from such rapid snowfall, and 135 incidents of downed powerlines in January and February. On January 6, 2019, a snow event closed Interstate 80 from Colfax to the Nevada state line for the better part of a busy 3-day holiday weekend leaving roughly 70,000 motorists stranded in the greater Truckee-Tahoe area.

Vulnerability to and Impacts from Severe Weather: Freeze and Snow

The District experiences temperatures below 32 degrees during the winter months. Freeze can cause injury or loss of life to residents of the District. While it is rare for buildings to be affected directly by freeze, damages to pipes that feed building can be damaged during periods of extreme cold. Freeze and snow can occasionally be accompanied by high winds, which can cause downed trees and power lines, power outages, accidents, and road closures. Transportation networks, communications, and utilities infrastructure are the most vulnerable physical assets to impacts of severe winter weather in the County.

Freeze and snow events are a major concern to the District. Snow and winter weather conditions regularly result in utility outages and the closure of major transportation routes. During extreme winter events, response times to emergencies may also be extended. With altitudes ranging from 6,000 to 9,000 feet above msl, extreme cold/freezing temperatures can create significant problems. Of particular concern to the District is the vulnerability of the area to broken utilities and power failures during extreme weather events.

Assets at Risk

All District assets (from Table M-4) are at risk from this hazard.

Severe Weather: Heavy Rains and Storms (Hail, Lightning)

Likelihood of Future Occurrence–Highly Likely

Vulnerability–High

Hazard Profile and Problem Description

Storms in the District occur annually and are generally characterized by heavy rain often accompanied by strong winds and sometimes lightning and hail. Approximately 10 percent of the thunderstorms that occur each year in the United States are classified as severe. A thunderstorm is classified as severe when it contains one or more of the following phenomena: hail that is three-quarters of an inch or greater, winds in excess of 50 knots (57.5 mph), or a tornado. Heavy precipitation in the District falls mainly in the fall and spring months.

Location and Extent

Heavy rain events occur on a regional basis. Rains and storms can occur in any location of the District. All portions of the District are at risk to heavy rains. Most of the severe rains occur during the fall and spring months. There is no scale by which heavy rains and severe storms are measured. Magnitude of storms is measured often in rainfall and damages. The speed of onset of heavy rains can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of severe storms in California, Placer County, and the District can range from minutes to hours to days. Information on precipitation extremes can be found in Section 4.3.4 of the Base Plan.

Past Occurrences

There have been past disaster declarations from heavy rains and storms, which were discussed in Past Occurrences of the flood section above. According to historical hazard data, severe weather, including heavy rains and storms, is an annual occurrence in the District. This is the cause of many of the federal disaster declarations related to flooding.

The High Sierras receive severe weather annually. Heavy rains, hail and lightning are known to create adverse conditions in the backcountry, within the communities and roads of the District. These Heavy rain events can lead to flash flooding, hail damage, and lightning caused ignitions within the District and surrounding ridges and peaks. The District is known to respond to vehicle accidents during periods of severe and heavy rain as well. The District responded to incidents labeled as “Severe Weather & Natural Disaster” since 2016 as follows:

- **2017:** 5 incidents, including windstorm, tornado/hurricane assessment
- **2018:** 6 incidents, including assess severe weather or natural disaster damage, and two lightning strikes with no fire.
- **2019:** 3 incidents, including one lightning strike, no fire.
- **2020:** 1 incident for a flood assessment.

Three lightning fires were reported in the USFS area adjacent to our service area in 2018, but are not in our statistics because the fires were extinguished by USFS and NTFPD resources were canceled prior to arrival.

Vulnerability to and Impacts from Heavy Rain and Storms

Heavy rain and severe storms are the most frequent type of severe weather occurrences in the District. These events can cause localized flooding. Elongated events, or events that occur during times where the ground is already saturated can cause 1% and 0.2% annual chance flooding. Wind often accompanies these storms and has caused damage in the past. Hail and lightning occur infrequently in the District.

Actual damage associated with the effects of severe weather include impacts to property, critical facilities (such as utilities), and life safety. Heavy rains and storms often result in localized flooding creating significant issues. Roads can become impassable and ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Floodwaters and downed trees can break utilities and interrupt services.

During periods of heavy rains and storms, power outages can occur. These power outages can affect pumping stations and lift stations that help alleviate flooding. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Inside the District, severe weather often occurs. The greatest damages often occur from high winds.

Assets at Risk

No District facilities are likely at direct risk; however, the District does respond to emergencies during severe weather events.

Severe Weather: High Winds and Tornadoes

Likelihood of Future Occurrence—Highly Likely

Vulnerability—High

Hazard Profile and Problem Description

High winds, as defined by the NWS glossary, are sustained wind speeds of 40 mph or greater lasting for 1 hour or longer, or winds of 58 mph or greater for any duration. High winds can cause significant property and crop damage, threaten public safety, and have adverse economic impacts from business closures and power loss. High winds are a primary factor in PSPS events.

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes form when cool, dry air sits on top of warm, moist air. Tornadoes are the most powerful storms that exist. Tornadoes, though extremely rare in the higher elevations of Placer County, are another severe weather hazard that can affect areas of the Placer County Planning Area, primarily during the rainy season in the fall and spring.

Location and Extent

The entire District is subject to significant, non-tornadic (straight-line), winds. Each area of the County is at risk to high winds. Magnitude of winds is measured often in speed and damages. These events are often part of a heavy rain and storm event, but can occur outside of storms. The speed of onset of winds can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of winds in California is often short, ranging from minutes to hours. The Beaufort scale is an empirical 12 category scale that relates wind speed to observed conditions at sea or on land. Its full name is the Beaufort Wind Force Scale. The Beaufort Scale was shown in Section 4.3.5 of the Base Plan.

Portions of the County are also located in a special wind hazard region, which is a result of foehn winds. A foehn wind is a type of dry down-slope wind that occurs in the lee (downwind side) of a mountain range. Winds of this type are called "snow-eaters" for their ability to make snow melt or sublimate rapidly. This snow-removing ability is caused not only by warmer temperatures, but also the low relative humidity of the air mass coming over the mountain(s). They are also associated with the rapid spread of wildfires, making some regions which experience these winds particularly fire prone.

Tornadoes, while extremely rare in Eastern Placer, can occur at any location in the County and District. Prior to February 1, 2007, tornado intensity was measured by the Fujita (F) scale. This scale was revised and is now the Enhanced Fujita scale. Both scales are sets of wind estimates (not measurements) based on damage. The new scale (EF) provides more damage indicators (28) and associated degrees of damage, allowing for more detailed analysis and better correlation between damage and wind speed. It is also more precise because it considers the materials affected and the construction of structures damaged by a tornado. The F Scale and EF Scale are shown in Section 4.3.5 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for winds and tornadoes. The District noted that since high winds is a regional phenomenon, events that affected the higher elevations of the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.5.

The HMPC noted recent events in December of 2014 where winds caused damage to power lines. The HMPC provided the information in Figure M-2. During this event, a structure fire occurred that was the direct result of a wind event in which a tree fell onto an occupied residence. Fortunately all occupants escaped the building without injury. Winds in the District were recorded as high as 80 mph that date with gust on the surrounding mountains in excess 130mph. High winds can fan the flames of wildfire in the District as well, increasing the size of wildfires very quickly.

Source: North Tahoe FPD

Since 2016, the District was affected by the following:

- 2017: 1 windstorm, tornado/hurricane assessment
- 2017: 135 instances of downed powerlines referenced above

Vulnerability to and Impacts from Severe Weather: Wind and Tornado

High winds are common occurrences in the District throughout the entire year. Straight line winds are primarily a public safety and economic concern. Windstorm can cause damage to structures and power lines which in turn can create hazardous conditions for people. Debris flying from high wind events can shatter windows in structures and vehicles and can harm people that are not adequately sheltered. High winds can impact critical facilities and infrastructure and can lead to power outages. Wind can also drive wildfire flames, spreading wildfires quickly. During periods of high winds and dry vegetation, wildfire risk increases. High winds that occur during periods of extreme heat can cause PSPS events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Impacts from high winds in the District will vary. Future losses from straight line winds include:

- Downed trees
- Power line impacts and economic losses from power outages
- Increased PSPS events
- Occasional building damage, primarily to roofs

North Tahoe Fire received 42 Fire Weather Watch or Red Flag Warnings since the 2016 LHMP. There is a direct correlation between red flag/critical fire weather and catastrophic wildfire. Red flag warnings are now factored into triggering PSPS events because of the substantial increase in fire risk and risk of catastrophic wildfire when low humidity is combined with high winds.

The Emerald Fire occurred adjacent to the District's service area, burning 176 acres of forest in October 2016 during a red flag weather event. The District stood up our CERT team and our EOC to support the incident.

Assets at Risk

All District assets (from Table M-4) are at risk from this hazard.

Tree Mortality

Likelihood of Future Occurrence–Likely

Vulnerability–High

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, and contribute to future fuel loads in forests surrounding communities.

During extended drought, tree mortality is driven by a build-up in endemic bark beetle populations and exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events.

Location and Extent

Onset of tree mortality events can be relatively fast; however conditions – such as high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas, and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 - 40 dead trees per acre
- Orange depicting 5 -15 dead trees per acre
- Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A number of Placer County areas were designated during this event and the majority of Placer County watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality, along with numerous Tier 1 High hazard “hot spots”. A map of these areas is shown in in Section 4.3.18 of the Base Plan.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015.

Vulnerability to and Impacts from Tree Mortality

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. Soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead

trees within the wildland urban intermix or wildland urban interface or urban areas therefore pose a greater risk to due to their proximity to residents, businesses, and road, power, and communication infrastructure.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure.

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. Soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

Dead trees have become a concern for the District due to the exacerbation of fire risk, fuel loading and direct threat to life and property when hazard trees are located within falling distance of homes.

Assets at Risk

All District assets from Table M-4 are at indirect risk from this hazard.

Wildfire

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Extremely High

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the North Tahoe FPD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Wildfire and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of

outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power outages can be found in Section 4.3.2 of the Base Plan.

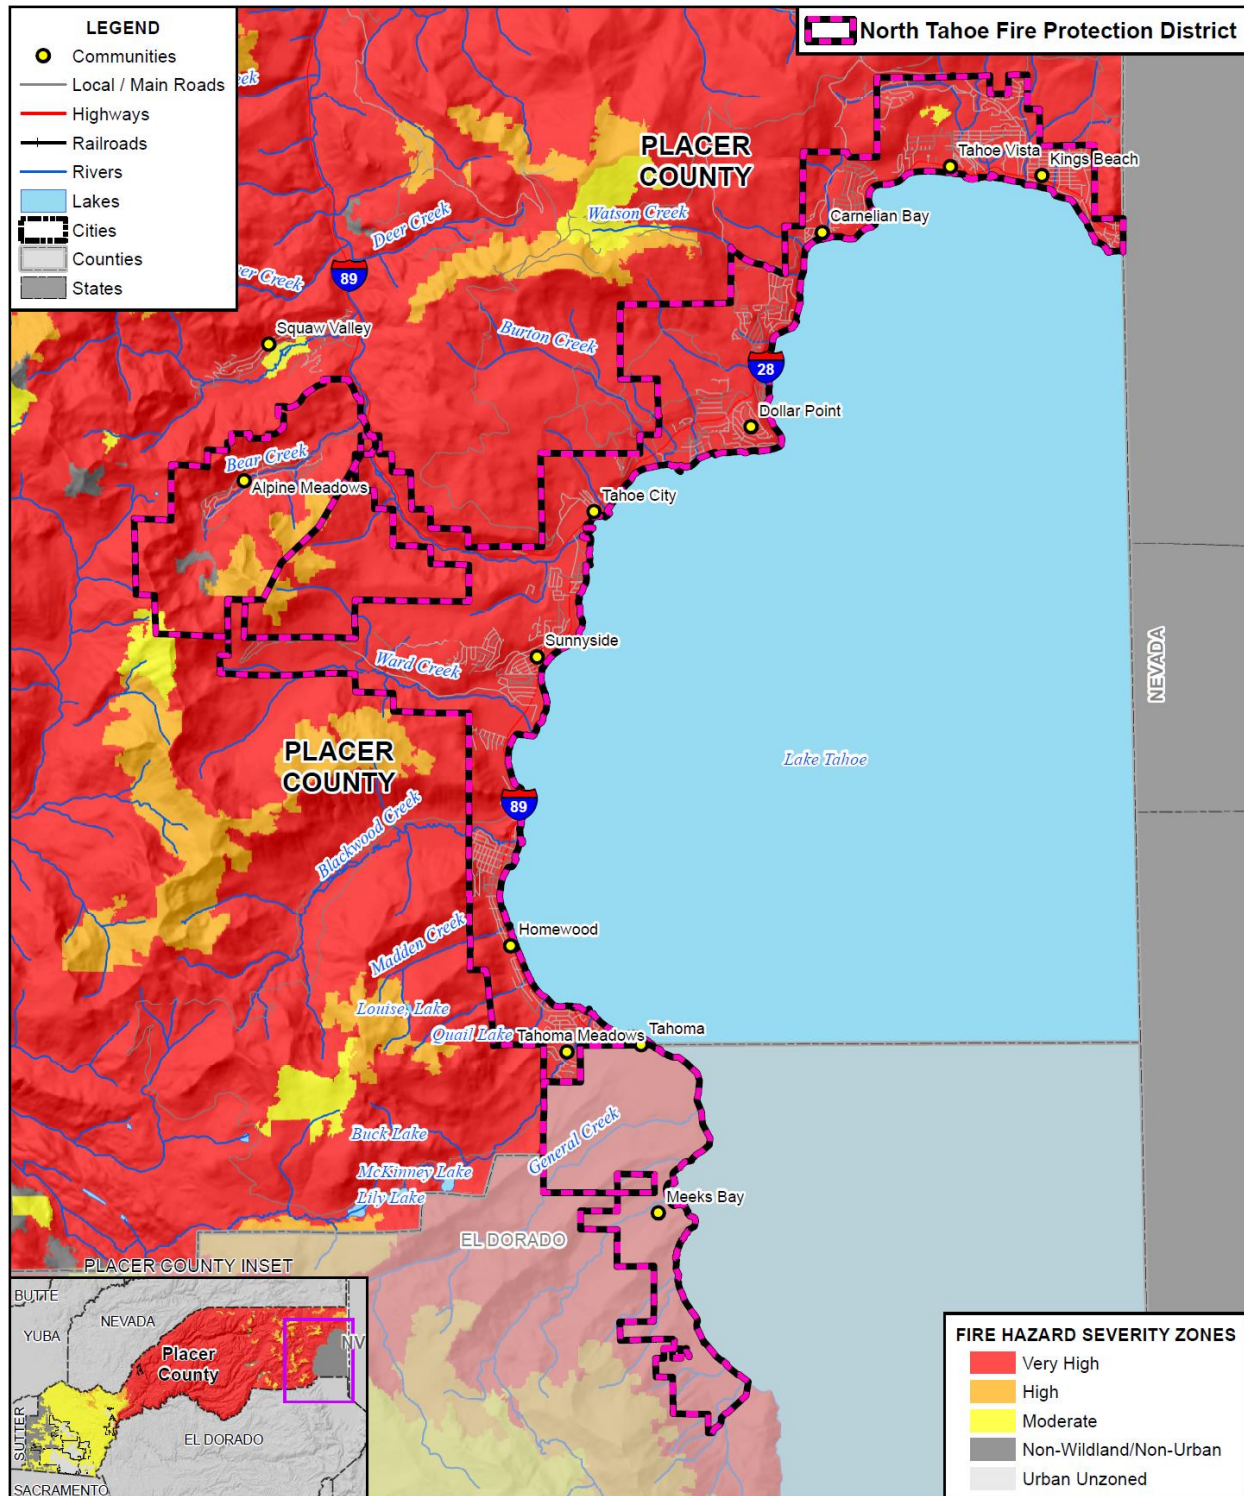

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, including periods of high winds, high temperatures, and low humidity, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. Though the area is not served by one of the three largest energy companies, Liberty Utilities can institute a PSPS if the CPUC calls for it. In partnership with fire weather experts, Liberty monitors real-time weather data and forecasts and regularly tests fuel moisture during the fire season. If it is determined that the forecasted conditions meet or exceed safety thresholds, Liberty will initiate a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the North Tahoe FPD were created. Figure M-3 shows the CAL FIRE FHSZ in the District. As shown on the maps, the fire hazard severity zones within the District are in the Very High range.

Figure M-3 North Tahoe FPD – Fire Hazard Severity Zones

COUNTY OF
Placer

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Fire Hazard Severity Zone (FHSZ) is a mapped area that designates zones (based on factors such as fuel, slope, and fire weather) with varying degrees of fire hazard (i.e., moderate, high, and very high). FHSZ maps evaluate wildfire hazards, which are physical conditions that create a likelihood that an area will burn over a 30- to 50-year period. They do not consider modifications such as fuel reduction efforts.

While FHSZs do not predict when or where a wildfire will occur, they do identify areas where wildfire hazards could be more severe and therefore are of greater concern. FHSZs are meant to help limit wildfire damage to structures through planning, prevention, and mitigation activities/requirements that reduce risk. The FHSZs serve several purposes: they are used to designate areas where California’s wildland urban interface building codes apply to new buildings; they can be a factor in real estate disclosure; and local governments consider fire hazard severity in the safety elements of their general plans.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table M-9.

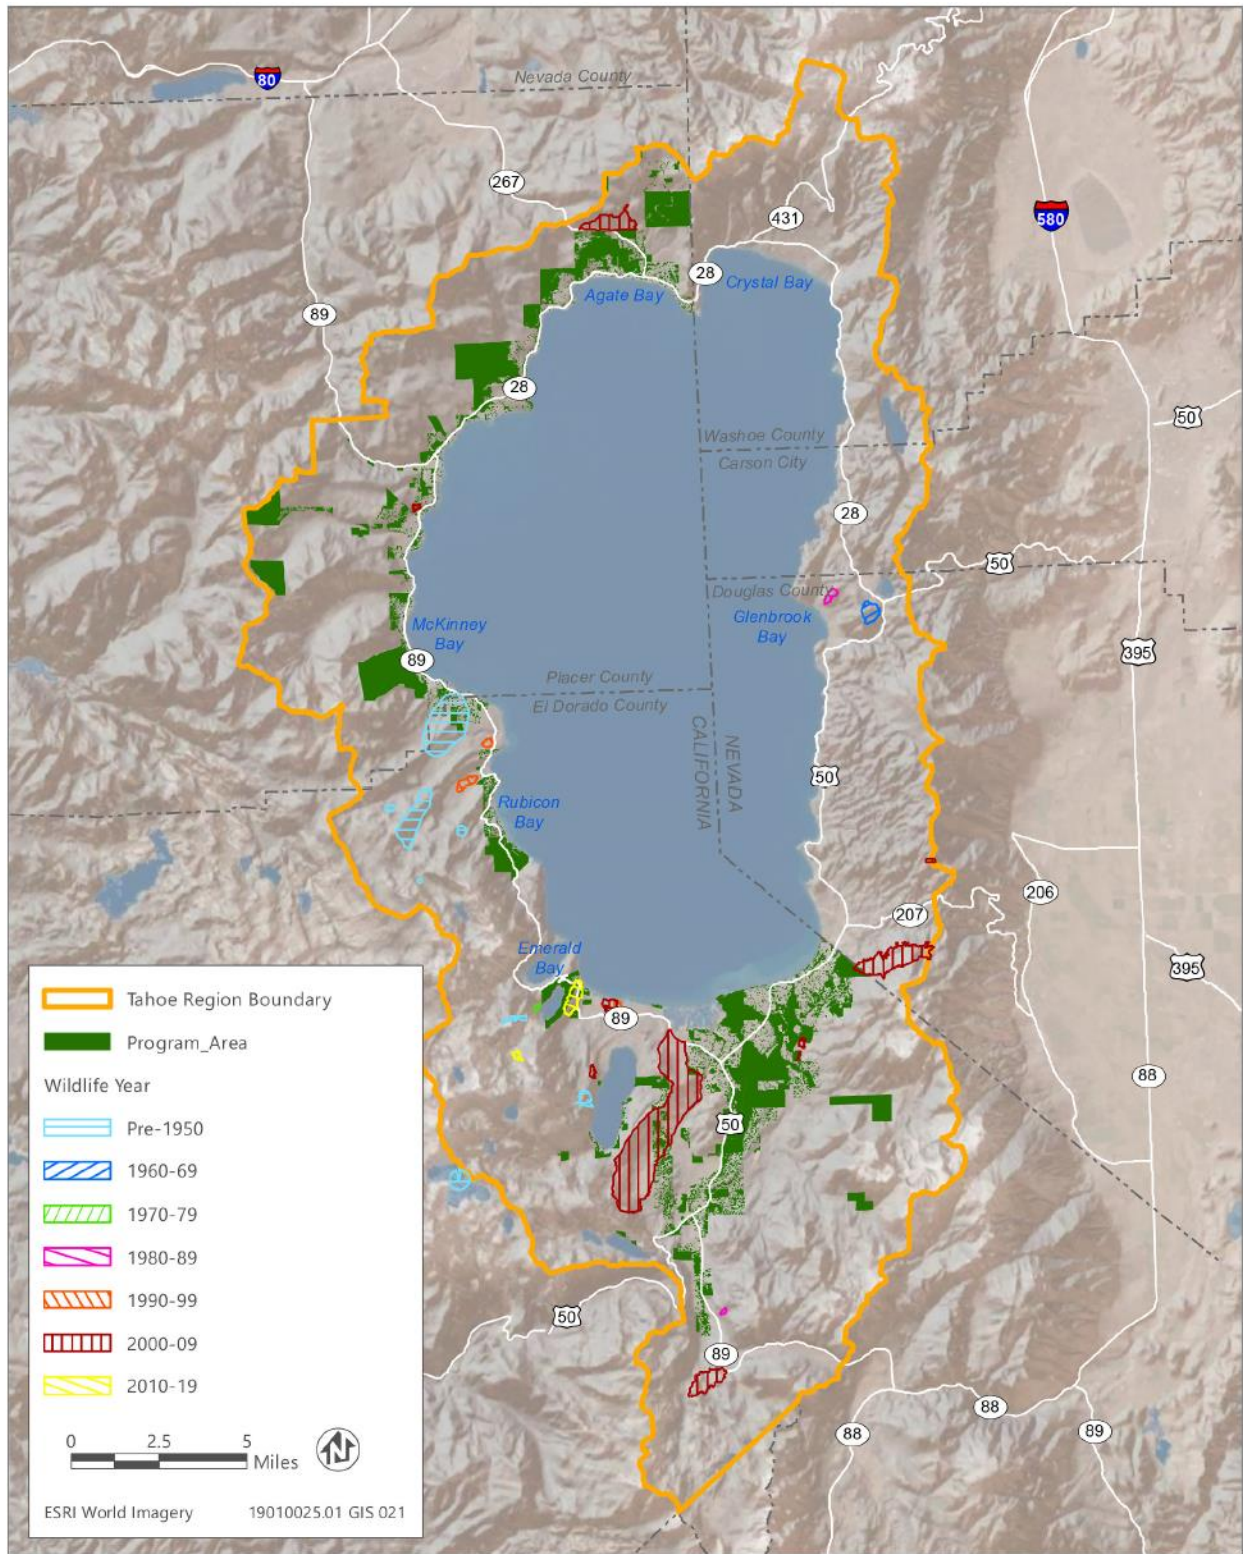

Table M-9 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Wildfire history in the North Tahoe area can be seen on Figure M-4.

Figure M-4 Tahoe Basin Wildfire History

Source: Draft Tahoe Program Timberland Environmental Impact Report 2020

A notable wildfire to impact the District was the Washoe Fire in August 2007. This fire occurred in the wildland urban interface area of Tahoe Park and Tahoe Woods subdivision, along the west shore of Lake Tahoe. Although no lives were lost, the fire destroyed 5 residential structures and encompassed 19 acres. Power and gas utilities incurred damages. There were also losses to timber assets, loss of watershed protection, and loss of the aesthetic value of a scenic corridor. This event caused major disruptions to west shore and Tahoe City traffic and business on a busy summer weekend. Highway 89 in West Lake was closed for a period of time.

Due to droughts in the North Tahoe FPD, widespread wildfires have occurred in or near District boundaries. In the first half of the 2010s, several large fires have impacted the Lake Tahoe Basin in various ways. The Angora fire burned over 300 structures and the King Fire burned almost 100,000 acres to the west of the basin and almost burned into the basin.

From 2016 - 11/17/2020 NTFPD responded to 115+ Wildland fire incidents. These include: Brush or brush and grass mixture fires, forest/woods/wildland fires, and natural vegetation fires. Almost all of these wildland fires required crews to establish fire lines, contain, and extinguish. Through mutual and automatic aid, NTFPD sent individual resources and strike teams out on the following large incidents in 2020.

Table M-10 NTFPD – Fires in 2020

Name of Fire	Dates	Personnel Assigned to Fire
Poeville	6/27-6/28	Chief STEN, B51 Captain, Engineer, 2 FF/P

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

All communities within the District are listed on the National Fire Plan's "Communities at Risk" list as set forth in Section 4.3.2 of the main plan.

Over one hundred years of aggressive fire suppression under the national fire suppression policy has rendered wildlands severely overgrown. Much of the private land in the District's area is in the wildland urban interface with increasing residential development.

According to the North Tahoe FPD, the following areas of the District were prioritized for projects because of their population, values at risk, and fuel availability:

- Tahoe City
- Lake Forest
- Highlands

- Dollar Point
- Cedar Flats
- Carnelian Bay
- Agate Bay
- Tahoe Vista
- Kings Beach
- Alpine Meadows
- Kingswood
- Talmont
- Tahoe Park
- Pineland
- Timberland
- Skyland
- Tahoe Pines
- Tahoe Swiss Village
- Homewood
- Chamberlands
- Tahoma
- Meeks Bay
- Rubicon
- McKinney Estates.

As more people move into the area and impacts from recreational demands increase, there will be more human-caused wildfire starts each year. And the increased number of widely scattered homes within the District adds greatly to the danger, complexity, and cost of fighting these fires.

Currently, many of the communities in the District are limited to one route access and egress in the event of a major wildfire. Historically, these routes are closed during major events, stranding many people, including visitors, away from their families and homes. So far there has been no loss of life attributed to the limited evacuation routes, but it is likely only a matter of time before people are cut off and trapped by a major fire event.

Forest overgrowth due to the efficiency of modern firefighting techniques, and to society's current election to limit forest thinning and harvesting, is a serious problem. If wildfire does not impact the forest first, native insects will eventually kill millions of trees. Explosions in insect populations usually start during a drought, when the lack of water combined with too many trees per acre render the trees too weak to fight off the insect attacks. Without a change in management practices on public lands, there is little hope of avoiding a kill off of trees similar to the kill off experienced by other national forests.

A notable recent wildfire to impact the District was the Washoe Fire in August 2007. This fire occurred in the wildland urban interface area of Tahoe Park and Tahoe Woods subdivision, along the west shore of Lake Tahoe. Although no lives were lost, the fire destroyed 5 residential structures and encompassed 19 acres. Power and gas utilities incurred damages. There were also losses to timber assets, loss of watershed protection, and loss of the aesthetic value of a scenic corridor. This event caused major disruptions to west shore and Tahoe City traffic and business on a busy summer weekend. Highway 89 in West Lake was closed for a period of time.

Due to recent droughts in the North Tahoe FPD, widespread wildfires have occurred in or near District boundaries. In the last few years several large fires have impacted the Lake Tahoe Basin in various ways. The Angora fire burned over 300 structures and the King Fire burned almost 100,000 acres to the west of the basin and almost burned into the basin. These are both described in the base plan in Section 4.2.17.

Wildland fires are a significant threat to regional power distribution systems. Power outages caused by wildland fires directly affect the safety of district residents, drastically restrict critical water system operations, and severely limit available water supplies for fire suppression.

Assets at Risk

All District assets from Table M-4 are at risk from this hazard. NTFPD is almost entirely classified as a Very High Fire Hazard Severity Zone in CAL FIRE FRAP maps

M.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

M.6.1. Regulatory Mitigation Capabilities

Table M-11 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the North Tahoe FPD.

Table M-11 North Tahoe FPD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	N	Placer County and TRPA Authority
Capital Improvements Plan	N	
Economic Development Plan	N	Placer County and TRPA Authority
Local Emergency Operations Plan	Y	2017 Placer County Emergency Operations Plan
Continuity of Operations Plan	N	
Transportation Plan	N	Placer County and Tahoe Transportation District Authority
Stormwater Management Plan/Program	N	Placer County, TRPA, Tahoe RCD, Lahontan RWQCB Authority

Engineering Studies for Streams	N	Placer County and Lahontan Regional Water Quality Control Board Authority
Community Wildfire Protection Plan	Y	2015 Lake Tahoe CWPP: Addresses hazards and includes mitigation strategies and actions
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation):	Y	
Tahoe Program Timberland Environmental Impact Report (Tahoe PTEIR)	Y	The Tahoe PTEIR is a Program Timberland EIR developed to address a long-term program of forest management and fuel reduction; Addresses hazards and includes mitigation strategies and actions
Community Risk Assessment/Community Risk Reduction Plan	N	NTPFD has identified the need for a formal CRA/CRRP and has applied to FEMA-AFG-FP&S to fund this risk assessment project
2018 Standards of Coverage and Deployment Plan (SOC)	Y	Addresses hazards and includes mitigation strategies and actions
Lake Tahoe Climate Change Adaptation Action Portfolio (CAAP)	Y	The CAAP is nearing completion, and addresses hazards and includes mitigation strategies and actions
Lake Tahoe Basin Multi-Jurisdictional Fuel Reduction and Wildfire Prevention Strategy		Addresses hazards and includes mitigation strategies and actions
Lake Tahoe Basin Forest Action Plan Lake Tahoe Basin Fuel Reduction and Wildfire Prevention Incident Action Plan		Addresses hazards and includes mitigation actions for that calendar year
Building Code, Fire Code, Local Ordinance, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	N/A	Placer County Authority
Building Code Effectiveness Grading Schedule (BCEGS) Score	N/A	
Fire department ISO rating:	Y	Rating: 3/3Y
Site plan review requirements	Y	Yes
Local Fire Prevention Ordinance	Y	Yes, Adoption and amendment of the CA Fire Code
Defensible Space Inspection Program	Y	Yes, Defensible space enforced through: Placer County Hazardous Vegetation and Combustible Material Ordinance (6015-B), El Dorado County Vegetation Management and Defensible Space Ordinance (5101), Assembly Bill 38, CALFIRE, and for building permit finalization.

Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts?
		Is the ordinance adequately administered and enforced?
Zoning ordinance	N	Placer County Authority
Subdivision ordinance	N	Placer County Authority
Floodplain ordinance	N	Placer County Authority
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	Y	Wildfire (local burning restrictions & noncombustible class a roof covering)
Flood insurance rate maps	N	Placer County Authority
Elevation Certificates	N	Placer County Authority
Acquisition of land for open space and public recreation uses	N	Placer County, USFS, California Tahoe Conservancy, TRPA Authority
Erosion or sediment control program	N	Placer County, TRPA, and Lahontan RWQCB Authority
Other		
How can these capabilities be expanded and improved to reduce risk?		
Expand capacity to implement these plans, codes and ordinances.		

Source: North Tahoe FPD

As indicated above, the District has several programs, plans, policies, and codes and ordinances that guide hazard mitigation. Some of these are described in more detail below.

Tahoe Community Wildfire Protection Plan, 2015

In 2015 the Tahoe Community Wildfire Protection Plan was created (2015 CWPP). This plan encompasses all areas of the Alpine Meadows and North Tahoe FPD that are at risk and directly outlines hazards and mitigations needed to preserve lives and property in these areas in the setting of a wildland fire incident. It is incorporated by reference here in support of the 2015 update to this document (Tahoe FFT.org). This website is hosted by the Tahoe Living with Fire Organization.

Integrated Vulnerability Assessment of Climate Change in the Lake Tahoe Basin (2020)

Climate change is amplifying the background stressors on natural resources, infrastructure, and communities in the Lake Tahoe Basin (Basin). Land managers and policy-makers are increasing the Basin’s resilience and ability to adapt. Doing this now protects people and nature, and saves money. This vulnerability assessment provides residents, visitors, businesses, and public agencies with state-of-the-art information on how patterns of temperature and precipitation will change (called “impacts”), and how these

patterns will affect the things people care about (called “implications”). The common scenarios and analyses provided will help public agencies and stakeholder organizations anticipate climate change implications, and better design and maintain their future projects that improve the quality of life, land, and waters in Tahoe. This assessment is written for a technical audience, and will feed directly into a Basinwide adaptation action plan written for all audiences.

North Tahoe Fire Protection District and Meeks Bay Fire Protection District Standards of Coverage and Deployment Plan (2018)

This report serves as the North Tahoe Fire Protection District and Meeks Bay Fire Protection District Standards of Coverage and Deployment Plan. It follows closely the Center for Fire Public Safety Excellence (CPSE) Standards of Coverage model that develops written procedures to determine the distribution and concentration of a fire and emergency service agency’s fixed and mobile resources. The purpose for completing such a document is to assist the agency in ensuring a safe and effective response force for fire suppression, emergency medical services, and specialty response situations.

This report focuses on the area within the boundaries of the two fire districts. Although the districts serve a larger area, those areas are served by contract with other entities.

It is important to understand that there are no mandatory federal or state regulations directing level of service, fire service response times, or outcomes. The body of regulations for the fire service provides that if fire services are provided, it must be done with the safety of the firefighters and citizens in mind.

Creating a Standards of Coverage and Deployment Plan document requires that a number of areas be researched, studied, and evaluated. This report will begin with an overview of both the community and the agency. Following this overview, the plan will discuss topics such as community risk assessment, critical task analysis, agency service level objectives, and distribution and concentration measures. The report will provide analysis of historical performance and will conclude with policy and operational recommendations.

Lake Tahoe Basin Fuel Reduction and Wildfire Prevention Incident Action Plan (2019)

To protect lives, property and the environment of the Lake Tahoe Basin from wildfire by implementing prioritized fuels reduction projects and engaging the public in becoming a Fire Adapted Community. Goals of this Plan are:

- Create fire adapted communities.
- Restore and maintain fire resilient landscapes.
- Support effective and efficient wildfire response.

Objectives of this include:

- Develop and implement prioritized fuel reduction treatments across jurisdictions to address risks to ecosystems and communities, and to facilitate safer and more successful suppression.
- Develop and implement fuels reduction projects that provide multiple resource benefits, including the enhancement of water quality, wildlife habitat, forest vegetation, recreation and scenic resources, and carbon sequestration.

- Implement mitigation strategies and community action plans to create communities where citizens are engaged and active in preparing for wildfire.
- Provide consistent and coordinated messaging and public involvement that reinforce fire adapted community concepts.
- Coordinate projects to streamline planning, leverage resources, and increase efficiency and effectiveness.
- Support increased funding and capacity for forest management, wildfire prevention, and community engagement.
- Increase restoration byproduct utilization, including biomass.
- Measure progress and monitor outcomes to inform future TFFT activities.

Lake Tahoe Basin Forest Action Plan (2019)

The Forest Action Plan (Plan) contains three overarching strategies that support completing and maintaining all wildland-urban interface treatments, and implementing large-landscape restoration:

1. Scale up to match the scale of the solution to the scale of the threat.

- Develop and Implement Landscape Scale Initiatives
- Streamline Planning and Permitting
- Create Powerline Resilience Corridors

2. Build capacity for all phases of the forest landscape management cycle.

- Expand the Restoration Workforce
- Adapt for Organizational Efficiency
- Strategically Use Prescribed Fire
- Increase Restoration Byproduct Utilization

3. Leverage technology for rapid, large-scale, more efficient implementation.

- Launch the Technology Innovation Sprint
- Improve Decision Making through Better
- Data Management
- Enable Rapid Response through a Wildfire
- Camera Network

The Plan aligns with state and federal plans and mandates that call for increasing the pace and scale of forest management including Nevada’s Cohesive Strategy Implementation Plan and Forest Action Plan, California Executive Orders B-52-18 and N-05-19, and USDA Forest Service Region 5’s Ecological Restoration Leadership Intent. The Plan implements the Forest Health focus area of the Basin’s Environmental Improvement Program, the signature partnership to restore and protect Tahoe’s natural resources.

Tahoe Program Timberland EIR (Draft 2020)

The PTEIR has been prepared to support an increase in pace and scale of forest management activities on the California side of the Tahoe Basin to reduce the risk of loss of lives and property, reduce fire suppression costs, protect natural resources from wildfire, and improve forest health in and adjacent to the WUI on the

California side of the Lake Tahoe Basin. The project-by-project approach that has typically been used to comply with California Environmental Quality Act (CEQA), California Forest Practice Act (FPA), California Forest Practice Rules (CFPR), and other regulatory requirements can lead to inefficiencies, delays, excess costs, and inconsistencies in project planning. In addition, a project-by-project approach to fuel reduction planning and environmental review provides limited opportunities to analyze and understand the long-term and cumulative effects of forest management programs. The Tahoe PTEIR more efficiently and comprehensively evaluates the environmental effects of the proposed program to facilitate an increase in the pace and scale of fuel reduction treatments.

The statement of objectives below describes the underlying purposes of the PTEIR and expresses the role of vegetation treatment in implementing state policies and plans for wildfire risk reduction, greenhouse gas (GHG) reduction, and management of natural and working lands. The objectives of the PTEIR are to:

- reduce the risk of catastrophic wildfires that could damage Lake Tahoe Basin forests, watersheds, habitats, and communities;
- increase Lake Tahoe Basin forest resilience to effects of climate change, including prolonged drought, pest and disease outbreaks and increased tree mortality;
- protect and restore meadow and riparian ecosystems, and forest habitat quality in the Lake Tahoe Basin;
- develop and implement all-lands fuel reduction, forest health improvement, and restoration projects that deliver multiple community and ecosystem service benefits; and
- increase the pace and scale of fuel reduction projects to assist in achieving the goals of Executive Order B-52-18

Homewood Evacuation and Life Safety Report (2016)

This report was commissioned by the North Tahoe Fire Protection District for the purposes of providing an evaluation and clarification of Homewood's commitments and mitigation and to provide further details as needed for construction standards, fire safety measures, evacuation procedures and shelter-in-place concepts to insure that the Project will not result in any significant adverse impacts on wildfire evacuation risks on the West Shore during construction or operation and will not exacerbate any existing wildfire evacuation risks in the Lake Tahoe region given the changed circumstances in the Project Area since the County's and TRPA's approvals in 2011.

Furthermore, to accomplish the goal of not exacerbating current evacuation systems for neighboring residents and visitors, this report evaluates Homewood's commitment to providing areas of refuge to increase life safety protection in the event of a fire requiring regional evacuation, in which residents outside of the Project boundary can find refuge in a wildland fire scenario.

Codes and Ordinances

Avalanche

Placer County's avalanche management program defines Potential Avalanche Hazard Areas (PAHAs) where the minimum probability of avalanche occurrence is 1 in 100 per year or where avalanche damage has already occurred. According to the Placer County Avalanche Ordinance the following information must be disclosed in PAHAs:

- Identification that a structure is within a PAHA;
- A warning that avalanche control work is conducted in the area and avalanche warnings will be provided as feasible; and
- Identification of sources that provide weather information and general information on avalanches.

In addition, the County limits construction as necessary in PAHAs and will not issue a building permit for construction in a PAHA without certifying that the structure will be safe under the anticipated snow loads and conditions of an avalanche.

M.6.2. Administrative/Technical Mitigation Capabilities

The board is comprised of 5 members representing 5 regions within the Lake Tahoe basin and is selected by registered voters within the District. The board serves as the governing body for the District’s more than 22,000 residents. Members of the board are elected by geographical Division for 4 years. The Board of Directors approves District Rules and Regulations and, through the Fire Chief, ensures adherence to District policies. District policy and actions may be adopted by motion, or more formally, by resolution.

The North Tahoe FPD provides services through Eight fire stations: Alpine Meadows, Tahoe City, Homewood, Meeks Bay, Tahoma, Dollar Hill, Carnelian Bay, and Kings Beach. These fire stations are staffed by 60 to 65 uniformed and support personnel. The Assistant Chief oversees the operations division which includes service delivery, communications, apparatus repair, replacement, and purchasing. The Assistant Chief is responsible for engine company staffing, alarm response guidelines, and standard operating procedures.

North Tahoe FPD’s dispatch services are provided by the Grass Valley Emergency Command Center in Grass Valley, CA. The dispatch center uses computer aided dispatching to ensure optimal resource monitoring and management utilizing the closest resource backed up by station cover assignments in a multi-tiered alarm structure.

For apparatus maintenance and repair the District employs 1 full-time Fire Mechanic and two part-time assistants. The District pursues an aggressive vehicle replacement policy which refurbishes engines after 10 years, places them in reserve after 20 years and replaces them after 25 years. District ambulances are designed to have the ambulance module remounted on a new chassis every 5 years until replacement. The North Tahoe Fire Protection District maintenance and repair facility personnel ensure the District purchases only items of a specified quality at the least expense to the taxpayers. The District maintenance and repair facility personnel are charged with all tasks associated with providing a safe and reliable apparatus fleet at the lowest possible expense to the taxpayers. Table M-12 identifies the personnel responsible for activities related to mitigation and loss prevention in the District.

Table M-12 North Tahoe FPD’s Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	Placer County
Mitigation Planning Committee	N	-

Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Forest Fuels Program
Mutual aid agreements	Y	Multiple in place and on-going with allied agencies
Other		
	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	N	-
Floodplain Administrator	N	-
Emergency Manager	N	1 Fire Chief, 3 Battalion Chiefs, 2 Division Chiefs and staff
Community Planner	N	-
Civil Engineer	N	-
GIS Coordinator	Y	GIS Program is developing
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Placer Count Sherriff 911, Caltrans message signs, NTFPD sign trailers, fire danger signs. Placer County Code RED, Emergency radio system 1630 AM, Website and social media. Alert Tahoe Cameras, CERT
Hazard data and information	Y	Occupancy pre-plan capabilities, MDT grant, Pre-attack plans, Tahoe PTEIR, Placer County Tree Mortality, FRAP FHSZ maps.
Grant writing	Y	Admin and Prevention staff
Hazus analysis	N	County GIS
Other		
How can these capabilities be expanded and improved to reduce risk?		
Additional grants and further program development.

M.6.3. Fiscal Mitigation Capabilities

Table M-13 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table M-13 North Tahoe FPD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	No. Yes.
Authority to levy taxes for specific purposes	Y	Yes, Special Tax and Tax Assessments have been used for operations and pre-hazard mitigation. Yes.

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Fees for water, sewer, gas, or electric services	N	-
Impact fees for new development	Y	Yes. Community Facilities District and AB1600 Mitigation Fees for capital purchases. Yes
Storm water utility fee	N	-
Incur debt through general obligation bonds and/or special tax bonds	Y	No. Yes.
Incur debt through private activities	Y	No. Yes
Community Development Block Grant	Y	No. Yes
Other federal funding programs	Y	Yes: FEMA AFG, SAFER, PDM, GEMT, IGT, and BLM-SNPLMA have all been awarded for mitigation projects. Yes
State funding programs	Y	Yes. JAC, CalOES, CALFIRE, OTS for operations, training, equipment and personnel program grants. Yes
Other		
How can these capabilities be expanded and improved to reduce risk?		
On-going program management and opportunities.

M.6.4. Mitigation Education, Outreach, and Partnerships

Table M-14 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table M-14 North Tahoe FPD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Yes	CERT, Fire Adapted Communities, Fire Safe Council, NFPA Firewise, Tahoe Fund, League to Save Lake Tahoe
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Yes	2015 Emergency Preparedness and Evacuation Guide, Tahoe Living with Fire, portable message signs
Natural disaster or safety related school programs	Yes	Fire safety week for the schools program
StormReady certification	No	
Firewise Communities certification	Yes	Forest Fuels serves as a Firewise Regional Coordinator to expand the number of Firewise communities

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Public-private partnership initiatives addressing disaster-related issues	Yes	Tahoe Fund
Other		
How can these capabilities be expanded and improved to reduce risk?		
Continued program management and development of mitigation related programs.		

Source: North Tahoe FPD

The North Tahoe FPD has automatic aid agreements with bordering Districts and mutual aid agreements with other fire agencies throughout the area. The District relies heavily upon this aid from their neighbors. Due to the high costs that are associated with a resort-based economy, three-quarters of the North Tahoe FPD personnel live outside of the area served. This requires additional personnel from neighbors to respond and assist with incidents that are within the operational area.

The District is also a participating member of the Sierra Front WildFire Cooperators, a bi-state, multi-agency organization. The cooperators address numerous issues pertaining to wildfire suppression, prevention and public education.

The District also works with other agencies on wildfire-related matters. Working with professional fire experts from the U.S. Forest Service and California Department of Forestry and Fire Protection helps ensure that the District’s work complements state and federal work and is up to standard for controlling wildfires.

In implementing many of the fuels management projects, the North Tahoe FPD works closely with the Tahoe Fire and Fuels Team which consists of representatives of Tahoe Basin fire agencies, CAL FIRE, Nevada Division of Forestry and related state agencies, the Nevada Fire Safe Council, the Tahoe Regional Planning Agency, the USDA Forest Service, conservation districts from both states, the California Tahoe Conservancy, and the Lahontan Regional Water Quality Control Board. Coordination of fuels reduction projects in the Tahoe Basin is overseen by a Multi-Agency Committee (MAC) comprised of the above agencies.

The District participates in the Lake Tahoe West Restoration Partnership. The Lake Tahoe West Restoration Partnership (Lake Tahoe West) is a collaborative effort to restore the resilience of forests, watersheds, and communities on 59,000 acres of Lake Tahoe's west shore. Wildfire, drought, and insects and disease epidemics—pressures that are amplified by climate change—threaten forests, watersheds, and communities across the Lake Tahoe West landscape. The goal of Lake Tahoe West is to restore the resilience of the west shore's forests, watersheds, recreational opportunities, and communities to such threats. The planning area includes approximately 59,000 acres of federal, state, local, and private lands, from Emerald Bay to Squaw Valley. Lake Tahoe West is a multi-stakeholder collaborative initiative convened by California Tahoe Conservancy, U.S. Forest Service Lake Tahoe Basin Management Unit, California State Parks, Tahoe Regional Planning Agency, Tahoe Fire and Fuels Team, and National Forest Foundation. The District’s primary mitigation strategies and actions will be through implementation of vegetation management treatments consistent with the Tahoe PTEIR program.

M.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

The District is involved in a variety of mitigation activities including, public education, fuels management projects, and other activities to reduce fuel loads and fire risk. These mitigation activities include:

- Public presentations and defensible space inspections
- Working with Homeowner's Association's through Fire Adapted Communities, Living with Fire and encouraging NFPA's Firewise recognition program
- Public outreach via website, social media, local paper and school education programs
- Fire & Life Safety structural plan review program
- Forest Fuel's management program
- Advise and assist with water system infrastructure improvements
- Details on some of the recent, ongoing mitigation projects are noted below.

Fuel Reduction Projects

The North Tahoe FPD is a member of the Tahoe Fire and Fuels Team and has partnered with the Meeks Bay Fire Protection District and the North Lake Tahoe Fire Protection Districts in Incline Village, Nevada to develop and implement a Coordinated Fuels Management and Defensible Space Program.

These organization's fuels management personnel and resources are shared and can be utilized in Meeks Bay, North Tahoe and the North Lake Tahoe Fire Districts as determined by project priority and funding availability. The combined fuels reduction dedicated staff includes a 20 person Type 2-IA hand crew, a 10 person fuels reduction module, a three person chipping crew, a registered Forester, and a NWCG qualified Type 2 Prescribed Fire Burn Boss. The Fuels program continuously applies for multiple grants through federal and state sources to aid in the continuation of a comprehensive fuels management program.

- 2019 WUI Fuels Reduction:
 - ✓ FEMA – North Tahoe Fire Hazardous Fuels Reduction and Defensible Space Project treated 154 lots/27 acres of CTC lots in Kings Beach.
 - ✓ SNPLMA – North Tahoe CWPP Project treated 80 acres of hand thin and pile within NTPUD ownership (Gentry property and Regional Park)
- 2020 WUI Fuels Reduction:
 - ✓ FEMA – North Tahoe Fire Hazardous Fuels Reduction and Defensible Space Project treated 106 lots/30 acres of CTC lots in Tahoe Vista, Agate Bay, Carnelian Bay, Cedar Flat, Dollar Point, Lake Forest and Tahoe City
 - ✓ SNPLMA – North Tahoe CWPP Project treated 57 acres of hand thin and pile within NTPUD's Regional Park.

Fuels Reduction: Chipper Program

The North Tahoe FPD provides residential curbside chipping to assist with removal of biomass from defensible space work to all properties within the District's geographic boundaries. This program is equivalent to about 100-300 acres of treatment in the district annually. Chipping statistics from 1999 to 2020 are provided in Table M-15. The District chipping statistics vary greatly in availability by year and

in numbers reported as the reporting methods and funding mechanisms have varied over the years. The reason for the large increase in these numbers in 2007 was due to the Angora Fire in 2006 that resulted in an increased need for defensible space in the region as over 300 homes were destroyed that year. It resulted in a large increase in wildfire awareness and the need for better defensible space around homes and businesses in the area. In subsequent years the numbers have stabilized and decreased at times. 2008 to 2013 and 2016 were unavailable.

Table M-15 Chipping Stats 1999-2020

Season	Parcels Treated	Pounds or Cubic Yards Biomass Removed
2020	886	19,031 cubic yards
2019	760	6,001 cubic yards
2018	897	9,612 cubic yards
2017	674	3,791 cubic yards
2016	-	-
2015	437	152,000 pounds
2014	325	104,000 pounds
2008-2013	N/A	N/A
2007	1,323	807,500 pounds
2006	567	379,278 pounds
2005	634	353,450 pounds
2004	543	286,285 pounds
2003	636	285,100 pounds
2002	517	248,000 pounds
2001	716	427,840 pounds
2000	407	223,087 pounds
1999	546	299,277 pounds
Totals		
5,889 Lots = 1472.25 at ¼ acre per lot average.		

Source: North Tahoe FPD

M.7 Mitigation Strategy

M.7.1. Mitigation Goals and Objectives

The North Tahoe FPD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

M.7.2. Mitigation Actions

The planning team for the North Tahoe FPD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Avalanche
- Climate Change
- Drought & Water Shortage
- Earthquake
- Floods: Localized Stormwater
- Pandemic
- Seiche
- Severe Weather: Freeze and Snow
- Severe Weather: Heavy Rains and Storms
- Severe Weather: High Winds and Tornadoes
- Tree Mortality
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Avalanche: Risk Reduction, Response Plan, and Pre-Incident Training

Hazards Addressed: Avalanche, Severe Weather: Freeze and Snow

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: According to the Sierra Avalanche Center, avalanches occur when loading of new snow increases stress at a rate faster than strength develops, and the slope fails. Avalanches are a rapid down-slope movement of snow, ice and debris triggered by ground shaking, sound, or human or animal movement. Avalanches consist of a starting zone where the ice or snow breaks loose, a track which is the grade or channel the debris slides down and a run-out zone where the snow is deposited.

Critical stresses develop more quickly on steeper slopes and where deposition of wind-transported snow is common. The vast majority of avalanches occur during and shortly after storms. This hazard generally affects a small number of people, such as snowboarders, skiers, and hikers who venture into backcountry areas during or after winter storms. However, avalanches can lead to loss of life, damage to road and highway closures, and destroy structures and forests in their path of travel.

NTFPD has multiple potential avalanche hazard areas, and a history of past occurrences that have caused significant damage or resulted in the loss of life, property and environment.

Project Description: NTFPD to work directly with Placer County and other partner agencies to assist in the development of an Avalanche Risk Reduction and Response Plan and conduct Pre-Incident Training (sand table or mock avalanche) to ensure all responding agencies can efficiently and cohesively respond to avalanche events. NTFPD to conduct a review and update to their Avalanche Response Policy and a study to determine what apparatus and equipment purchases are needed to be well-equipped for response to this hazard.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: Placer County Code 12.40 Avalanche Management Areas. NTFPD Lexipol Policy 319: Avalanche Response Policy.

Responsible Agency/ Department/Partners: Placer County / NTFPD/ Multi-Agency

Cost Estimate: Scalable, dependent on need to contract development of plan and purchase necessary equipment

Benefits (Losses Avoided): Life, Property, Environment

Potential Funding: Private, State, County, Local, Private

Timeline: 1 year to conduct Avalanche Risk Reduction and Response Plan. Ongoing pre-incident training exercises and purchase of necessary apparatus and equipment

Project Priority (H, M, L): H

Action 2. Communications: Upgrades, Development, Maintenance, and Enhancement of Interoperability Radio Systems

Hazards Addressed: Multi-Hazard (Emergency Response to Avalanche, Climate Change, Drought & Water Shortage, Earthquake, Floods: Localized Stormwater, Pandemic, Seiche, Severe Weather: Freeze and Snow, Severe Weather: Heavy Rains and Storms, Severe Weather: High Winds and Tornadoes, Tree Mortality, and Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Communications is a critical factor in the operations and daily functions of North Tahoe Fire Protection District. Radio communications is the primary source of dispatch for all fire

department operations. The current radio system is a complex network of fixed and mobile infrastructure that allows for fire resources to effectively communicate with dispatch and other public safety agencies to mitigate emergency and non-emergency incidents.

The need for effective communications, consolidated dispatch, technology updates, and multi-jurisdictional interoperability are critical to firefighter and public safety as well as property and environmental conservation. FCC P-25 is an unfunded mandate of significant expense that affects the local taxpayer and fire district budgets for many years. Radio Equipment has a limited-service life, requires consistent maintenance and upgrades, and is an expensive expenditure for the district. The District also has dead zones and has identified the need for repeaters, and repeater replacements for complete coverage.

Project Description: NTFPD will plan and implement communications related upgrades, developments, replacements, maintenance, and enhancement of current systems in order to meet cross-jurisdictional interoperability needs.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: NTFPD and the Lake Tahoe Regional Fire Chiefs Association solicited a Department of Homeland Security CISA Bi-state Communications Center assessment reports (Tahoe Regional Command Center Study & Communications Infrastructure) and the Federal Communication Commission (FCC) Standards and Specifications. State of California, Office of Emergency Services Standards and Specifications. State of California, CAL FIRE Standards and Specifications.

Responsible Agency/ Department/Partners: NTFPD and Emergency Service Partners

Cost Estimate: \$500,000+ for base, mobile, portable, and fix geographical repeater radios and systems. \$200,000 annually for Grass Valley Emergency Command Center contract and NTFPD Upgrades/Replacements/Repair/Maintenance needs. Pending results of DHS CISA studies it is anticipated that a multi-million dollar project will be needed to bring comms systems up to regional standards.

Benefits (Losses Avoided): Life, Property and Environment. Technology and equipment upgrades, Interoperability with multi -disciplinary emergency response agencies, use of a regional, multi-agency collaborated dispatch center, local regional partnerships between state & local public safety agencies with cost sharing of maintenance and development of critical infrastructure.

Potential Funding: Federal, State, County, Local, Private

Timeline: New projects are prioritized and completed as funding becomes available. Older equipment is replaced with new equipment that meets FCC guidelines, Department of Homeland Security, SAFECOM, 6 Levels of Interoperability as well as CAL FIRE and CalOES comms standards. Maintenance of current infrastructure is part of Fire District's annual budget and is supported by local taxpayers.

Project Priority (H, M, L): H

Action 3. *Community Wildfire Prevention Plan Implementation: Forest Management, Fuels Reduction, Defensible Space, Home Hardening, Curbside Chipping, Greenwaste Disposal, Tree Marking, Fire Adapted and Firewise Communities, Outreach & Education*

Hazards Addressed: Multi-Hazard: Wildfire, Tree Mortality, Climate Change, Severe Weather: High Winds

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Wildfire is inevitable in the Lake Tahoe Basin. In fact, many of the region’s plant and animal species are dependent on the natural disturbance caused by wildfires. The disturbance creates opportunities for new growth, cycles nutrients through soils, and maintains biological diversity. Such species are fire-adapted and have developed strategies to survive and thrive in the presence of wildfire. Wildfires become disasters when they threaten lives, burn homes, destroy infrastructure, and damage watersheds. Developing and implementing strategies to make human communities more fire-adapted can prevent or lessen the impact of such disasters. The Community Wildfire Protection Plan provides strategies that can be implemented by fire agencies, land managers, policy makers, community leaders, residents, visitors, and others that will make Lake Tahoe Basin communities better prepared for the next inevitable wildfire, as well as respond to tree mortality, and adapt to climate change.

Following widespread wildland fires in the summer of 2002, President George W. Bush proposed the Healthy Forests Initiative, which was enacted into law by the Healthy Forests Restoration Act of 2003 (Public Law 108-408). The Act encouraged thinning dense forests on federal, state, local, and private land to help protect communities from intense wildfires, improving fire suppression capabilities, and increasing forests’ resistance to destructive insects. Communities were also encouraged to create a Community Wildfire Protection Plan (CWPP) to collaboratively designate areas in the Wildland-Urban Interface that were the most in need of thinning.

Project Description: Implement the Lake Tahoe Multi-Jurisdictional Fuel Reduction & Wildfire Prevention Strategy, Lake Tahoe Basin Community Wildfire Protection Plan, and the Lake Tahoe Basin Forest Action Plan within communities that NTFPD serves.

Projects include but not limited to:

- Collaborate and plan projects and initiatives with all interested partners
- Prioritize Hazardous Fuel Reduction
- Restore & Maintain Fire-Resilient Landscapes
- Provide Effective & Efficient Wildfire Response
- Treat Structural Ignitability
- Defensible space inspections, education, assistance and enforcement
- Home Hardening and retrofit education and assistance
- Residential Chipping program, Greenwaste & Biomass utilization and disposal
- Tree Marking and Tree Removal Permits
- Create Fire Adapted Communities
- Coordinate Firewise USA recognition

- Encourage and provide effective and appropriate Forest Management and Fuels Reduction to act and adapt to a changing climate
- Implement the Tahoe PTEIR Program
- Provide robust public outreach and education
- Provide Community Assistance and Incentivization

Other Alternatives: Aggressive Fire Suppression which is not acceptable as a sole action to mitigate risk

Existing Planning Mechanism(s) through which Action Will Be Implemented:

- Lake Tahoe Multi-Jurisdictional Fuel Reduction & Wildfire Prevention Strategy
- Lake Tahoe Basin Community Wildfire Protection Plan
- Lake Tahoe Basin Forest Action Plan
- Tahoe Program Timberland Environmental Impact Report (Tahoe PTEIR)
- Lake Tahoe Climate Adaptation Action Portfolio
- Placer County Sustainability Plan
- California’s Climate Change Scoping Plan
- California’s Wildfire and Forest Resilience Action Plan
- CAL FIRE (NEU & AEU) Strategic Fire Plans

Responsible Agency/ Department/Partners: NTFPD/Partner Tahoe Fire and Fuels Team/Partners/Stakeholders/Community Members

Cost Estimate: \$1,000,000+ annually

Benefits (Losses Avoided): Life, Property and Environment

Potential Funding: Federal, State, County, Local, Private

Timeline: Ongoing

Project Priority (H, M, L): H

Action 4. GIS Technology, Equipment, Database and Mapping Improvements

Hazards Addressed: Multi-Hazard (Avalanche, Climate Change, Drought & Water Shortage, Earthquake, Floods: Localized Stormwater, Pandemic, Seiche, Severe Weather: Freeze and Snow, Severe Weather: Heavy Rains and Storms, Severe Weather: High Winds and Tornadoes, Tree Mortality, and Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Handle and manipulate information, statistical analysis, project planning and tracking, fire prevention, fuels management, parcel treatment, services provided:

- GIS/GPS interface for response routes, hydrant flow data and physical locations when covered by snow.
- Critical tool for many applications used in fuels management, prevention and emergency services.
- Sharing information with other agencies for project work; and
- Presentations for public education, evacuation routes, fuels management.

Project Description: Identify personnel to receive in-depth ArcGIS training and purchase all necessary GIS licensing and equipment to support the District’s GIS capabilities and needs. Retain an annual GIS budget to train current staff or consider contracting out in-depth GIS data analysis, map creation and geographic data entry needs.

Other Alternatives: None identified

Existing Planning Mechanism(s) through which Action Will Be Implemented: Tahoe Basin Fire Commission Report, Recommendation #6. Identified inherent need to increase GIS capabilities

Responsible Agency/ Department/Partners: NTFPD

Cost Estimate: \$100,000 to train dedicated staff and purchase additional equipment

Benefits (Losses Avoided): Improve response times and availability of information on emergencies as well as improved regional information sharing

Potential Funding: Federal, State, County, Local, Private

Timeline: Ongoing

Project Priority (H, M, L): H

Action 5. Pandemic Preparedness and Response Plan

Hazards Addressed: Pandemic

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: A pandemic occurs when a new virus emerges for which there is little or no immunity in the human population; the virus causes serious illness and spreads easily from person-to-person worldwide. Pandemics do not directly affect District facilities, but can affect District personnel who operate and manage District facilities and apparatus, including ambulances. During a pandemic the District would typically be considered essential, which puts staff on the front line and at immediate high-risk for exposure as they work to carry on the mission of the District and serve the community. Because there are no hospital facilities in the District, North Tahoe Fire must be adequately prepared not only to carry out their typical first responder duties, but also to transport patients who have become infected with the virus, while protecting other patients who have not been exposed or infected.

The 20th century saw three outbreaks of pandemic flu:

- The 1918-1919 Influenza Pandemic (H1N1)
- The February 1957-1958 Influenza Pandemic (H2N2)
- The 1968 Influenza Pandemic (H3N2)

To date, the 21st century has seen two acknowledged pandemics:

- 2009 Swine Flu (H1N1)
- 2019/2020/2021 COVID-19

As experienced during the COVID-19 pandemic and its multiple waves, closures and stay-at-home orders disrupted supply chains globally, and interrupted the delivery of basic services and essential supplies. A Pandemic Preparedness Response Plan is necessary for the District to be prepared for the next global pandemic, and its impacts to the services we provide. This includes priority access to PPE, Virus Testing and Vaccines, as well as a plan for reimbursement for the treatment and transport of viral patients, and a reimbursement of costs resulting from the response to the pandemic, including lost revenue.

Project Description: North Tahoe Fire has identified essential supplies, functions and services needed to sustain its mission and operations during a pandemic. In order to perform our mission, the District must have an adequate supply of PPE and disinfecting methodologies to protect staff, facilities and equipment in order to safely serve our community. The project reflects lessons learned from the response so far, and serves as a basis for continued preparedness and progress through and beyond the current pandemic.

A Pandemic Preparedness Response Plan includes an available cache of:

- Gloves
- Masks, Face Coverings, and N95s
- Face shields
- Booties
- Goggles
- Gowns
- PAPRs
- Disinfecting sprays/treatments
- Sterilizing equipment for ambulances, engines, equipment and facilities
- Material for vertical separations
- Virus Testing
- Vaccines

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: The District's "Response to Executive Order N-25-20" will serve as the planning mechanism for Pandemic Response, and to guide for Station and Personnel Directives, and Incident Directives.

Responsible Agency/ Department/Partners: North Tahoe Fire Protection District

Cost Estimate: \$200,000

Benefits (Losses Avoided): This project would specifically meet the tenets specified in the Public Assistance Program and Policy Guide - FP-104-009-2 / June 2020 by providing a plan for the District to fulfill its mission while preventing barriers to community lifelines that eliminate or lessen immediate threats to lives, public health, or safety in a cost-effective manner. The Plan helps foster better integration across the whole community since lifeline management transcends public and private sector boundaries.

Potential Funding: Federal, State, County, Local

Timeline: 5 years in conjunction with the LHMP

Project Priority (H, M, L): H

Action 6. Tahoe Emergency Notifications System (TENS)

Hazards Addressed: Multi-Hazard: Wildfire, Seiche, Avalanche, Earthquake, Severe Weather

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The region’s natural attributes are the biggest driver of its \$5billion annual economy, which is based on outdoor recreation and tourism. Cellular data shows that nearly ten million vehicles travel here annually which results, in part, because of Lake Tahoe’s central location in the Sierra Pacific Megapolitan Area, a corridor of growing metropolitan areas that extends from the San Francisco Bay Area to Reno. More than 14 million people live in this corridor, and many visitors drive to Lake Tahoe to enjoy its world-class recreation opportunities. Visitation can exceed 24 million annually with the peak visitation in summer when fire danger is high, and in winter when snow is at its heaviest. Peak visitor traffic causes significant congestion in community centers, at recreation areas, and at the six regional entry and exit points, which affects emergency response times.

With a large, centralized lake that crosses two states and five counties, a rugged mountainous landscape, and severe weather conditions, the area is susceptible to fire, avalanche, mudslide, and flooding, and climate change will only exacerbate these issues. High visitation rates in the area and an increase in vacation rentals result in a significant number of people present in the Basin who are unfamiliar with the regional evacuation protocols, limited egress routes, or where to access information.

The District has programmable mobile sign trailers, however public messaging is a challenge when visitors are not signed up to receive emergency alerts from any of the five counties they may visit during their stay.

Project Description: North Tahoe Fire Protection District, in partnership with the Tahoe Transportation District, will work with regional partners to build an interoperability situational awareness platform and associated public warning system that can support and integrate with regional dispatch systems, Nevada Dept. of Transportation (NDOT), Caltrans ITS systems, and the AlertTahoe System (<http://www.alertwildfire.org/tahoe/>). NDOT, Highway Patrol, and the Regional Transportation Commission (RTC) of Southern Nevada are implementing a “Software as a Service” platform that was integrated with the RTC’s ITS system, and Nevada is expanding the system statewide. Southern Nevada’s initial findings have shown an improvement of 10 to 15 minutes in incident response time in just a few months’ time. They are integrating fire incidents into the system and are expecting similar improved performance in fire response times. The system uses real-time data to provide automated incident identification through a multitude of sources, such as inductive loop traffic detectors, microwave vehicle detectors, on-board devices (OBD II), navigation apps, telematics, weather data, special events (Ticketmaster), dynamic warning signs, construction and road closure information, road camera feeds, traffic crashes and incidents (through crowd sourcing, such as Waze and the 911 systems), and public transit information. The demonstration system is now moving towards more predictive insights and early warnings for proactive crash prevention and dynamic traffic flow optimization.

The Utility and Infrastructure project, Tahoe Evacuation Notification System (TENS), will provide a cross-jurisdictional system that emergency managers will use to improve performance, while providing predictive insights and more connectivity between

first responders, traffic and transit operations, and the public. The system will integrate publicly available datasets to provide a better understanding of visitors in the Lake Tahoe Basin, including travel movements and duration of stay, emergency roadway issues

including closures or hazards caused by landslides, fires, toxic spills, avalanches, tree falls, downed power lines and power outages. These criteria will be considered for real-time detection and notification systems and reduction in secondary incidents.

As wildland fire is the biggest risk in the Tahoe Basin, further benefits will include early notification of wildland fire through the Alert Tahoe Camera system that will allow fires to be pinpointed and relayed back into the end warning system. Additionally, the application will provide location information to direct the public to defibrillators placed throughout public areas within the Basin. Smart streetlights will be utilized for housing a variety of warning systems and to provide input to public agencies for overall situational awareness that can influence disaster management and evacuations. Public notifications and overall public agency situational awareness input would include audio speakers, siren warning systems, dynamic message boards, outdoor acoustic sensors, weather sensors, camera systems, and lights to influence directional traffic flows in the event of evacuations. Although the intent of these devices is not to provide communications, they are built to communicate these disaster warnings and notifications back to the public, including a multi-lingual fashion if required by the demographic aspect of the communities.

Other Alternatives: No action alternative or business as usual

Existing Planning Mechanism(s) through which Action Will Be Implemented: Intelligent Transportation System (ITS) upgrades and traffic management are identified as priority projects in the Tahoe Regional Planning Agency 2020 Regional Transportation Plan. The Tahoe Transportation District utilizes Article IX of the Bistate Planning Compact and the adopted Regional Transportation Plan as its planning mechanism.

Responsible Agency/ Department/Partners:

- North Tahoe Fire Protection District
- Tahoe Transportation District
- Tahoe Regional Planning Agency

Cost Estimate: \$8,000,000.00

Benefits (Losses Avoided): This project would: 1) specifically meet the tenets specified in the Public Assistance Program and Policy Guide - FP-104-009-2 / June 2020 by providing community lifelines that; 2) eliminate or lessen immediate threats to lives, public health, or safety; and 3) eliminate or lessen immediate threats of significant additional damage to improved public or private property in a cost-effective manner that fosters better integration and communication across the whole community since lifeline management transcends public and private sector boundaries.

Potential Funding: Federal, State, County, Local, Private

Timeline: 3-5 years implementation, with ongoing support and maintenance.

Project Priority (H, M, L): H

Action 7. Water for Fire Suppression Collaborative

Hazards Addressed: Multi-Hazard: Wildfire, Severe Weather: Snow, Drought & Water Shortage

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: NTFPD has identified the need to advise and assist with water system infrastructure improvements in order to increase the availability of water to support fire suppression operations year-round. The District is at risk to wildland fire during fire season, and severe winter storms and snowpack creates a unique challenge to locate and access fire hydrants during winter months when needed for structure fires. Climate change has also led to decreased snowpack and multi-year droughts that exacerbate wildfire risk and can lead to water shortages. There are over 1055 fire hydrants in the District serviced by 16 different water purveyors, with only 4 of those being public. Many of these small water purveyors have little to no funds available for infrastructure testing, inspecting, repairs and upgrades. Several of these systems were installed 50-100 years ago and were designed to only provide domestic water for season customers. NTFPD is faced with inadequate water supply, delivery, storage, and locations of fire hydrants. These infrastructural inadequacies have always existed within the District and have remained a top concern during the last two fire code adoption cycles. Adequate fire suppression infrastructure is a key component of community fire suppression capabilities. Allowing these inadequacies to exist without taking proactive steps to test, inspect and notify our various water purveyors has led to loss of property, threat to surrounding properties, damage to fire equipment, transmission into the wildland, and water-related inadequacies per The Fire Code for residential and commercial projects. The lack of adequate fire flow has a direct relation to life safety, environmental protection, property loss prevention and economic stability.

Project Description: North Tahoe and Meeks Bay Fire Protection Districts (NTFPD) will facilitate development of a collaborative "Water for Fire Suppression" partnership to inspect, test, paint, document data in GIS layer, and provide notifications in order to mitigate varying concerns and inadequacies with water delivery and storage on the California side of the Lake Tahoe Basin within District boundaries. This collaborative will allow NTFPD to interface with 16 water purveyors across 1055 fire hydrants in order to best serve 17,000 structures during fire season and winter weather alike.

Other Alternatives: No action alternative, Educate Water Purveyors. Neither will reasonably mitigate these hazards in the near-term

Existing Planning Mechanism(s) through which Action Will Be Implemented: The District is currently developing a Community Risk Assessment and Community Risk Reduction plan that would include water-related inadequacies as a risk and directly link to risk reduction mitigation actions. Lake Tahoe Community Fire Prevention Partnership (bi-state collaboration to improve water distribution systems and regional interconnectivity to be prepared to respond to wildfire)

Responsible Agency/ Department/Partners: NTFPD and 16 Water Purveyors

Cost Estimate: \$750,000 for initial 3 to 5 year project to hire a District water supply officer, purchase equipment necessary for testing and winter snow removal, conduct inspections, painting and installation of snow markers of all hydrants. data entry, GIS updates, and noticing. Project is scalable into the multi-million dollars to include critical infrastructure vegetation management, hydrant risers, water infrastructure replacements, upgrades and enhancements, and purchase of a fire boat as a floating hydrant to enhance fire suppression capabilities.

Benefits (Losses Avoided): Loss of Life, Property and Environment. The number one threat to Lake Tahoe Basin is wildland fire. Lake Tahoe's Angora Fire in 2007 burned 3,071 acres, destroyed 254 homes, and incurred and estimated \$150,000,000 in property loss and \$12,000,000 in suppression costs. Couple the threat of catastrophic wildfire with an increasingly drier climate and forecasted climate change impacts, increasing the availability of water for fire suppression has a direct relation to life safety, environmental protection, property loss prevention and regional economic stability.

Potential Funding: Federal, State, County, Local, Private

Timeline: 3-5 years. This project will remain ongoing as annual hydrant testing, exercising and snow removal is priority and necessity

Project Priority (H, M, L): H

Annex N North Tahoe Public Utility District

N.1 Introduction

This Annex details the hazard mitigation planning elements specific to North Tahoe Public Utility District (NTPUD or District), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to NTPUD, with a focus on providing additional details on the risk assessment and mitigation strategy for this community.

N.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table N-1. Additional details on plan participation and District representatives are included in Appendix A.

Table N-1 NTPUD – Planning Team

Name	Position/Title	How Participated
Suzi Gibbons	Contracts and Planning Coordinator	Attended meetings. Provided input on past hazards. Filled out hazard ID table. Provided information on capabilities. Provided information on past and future mitigation actions. Reviewed and provided information and edits to Annex. Provided logo and base map.
Joe Pomroy, P.E.	Engineering and Operations Manager	Provided input on hazard ID table. Provided information on capabilities. Provided information on past and future mitigation actions. Reviewed and provided information and edits to Annex.
Vanetta Van Cleave	Chief Financial Officer	Provided financial information.

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the District integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the District incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table N-2.

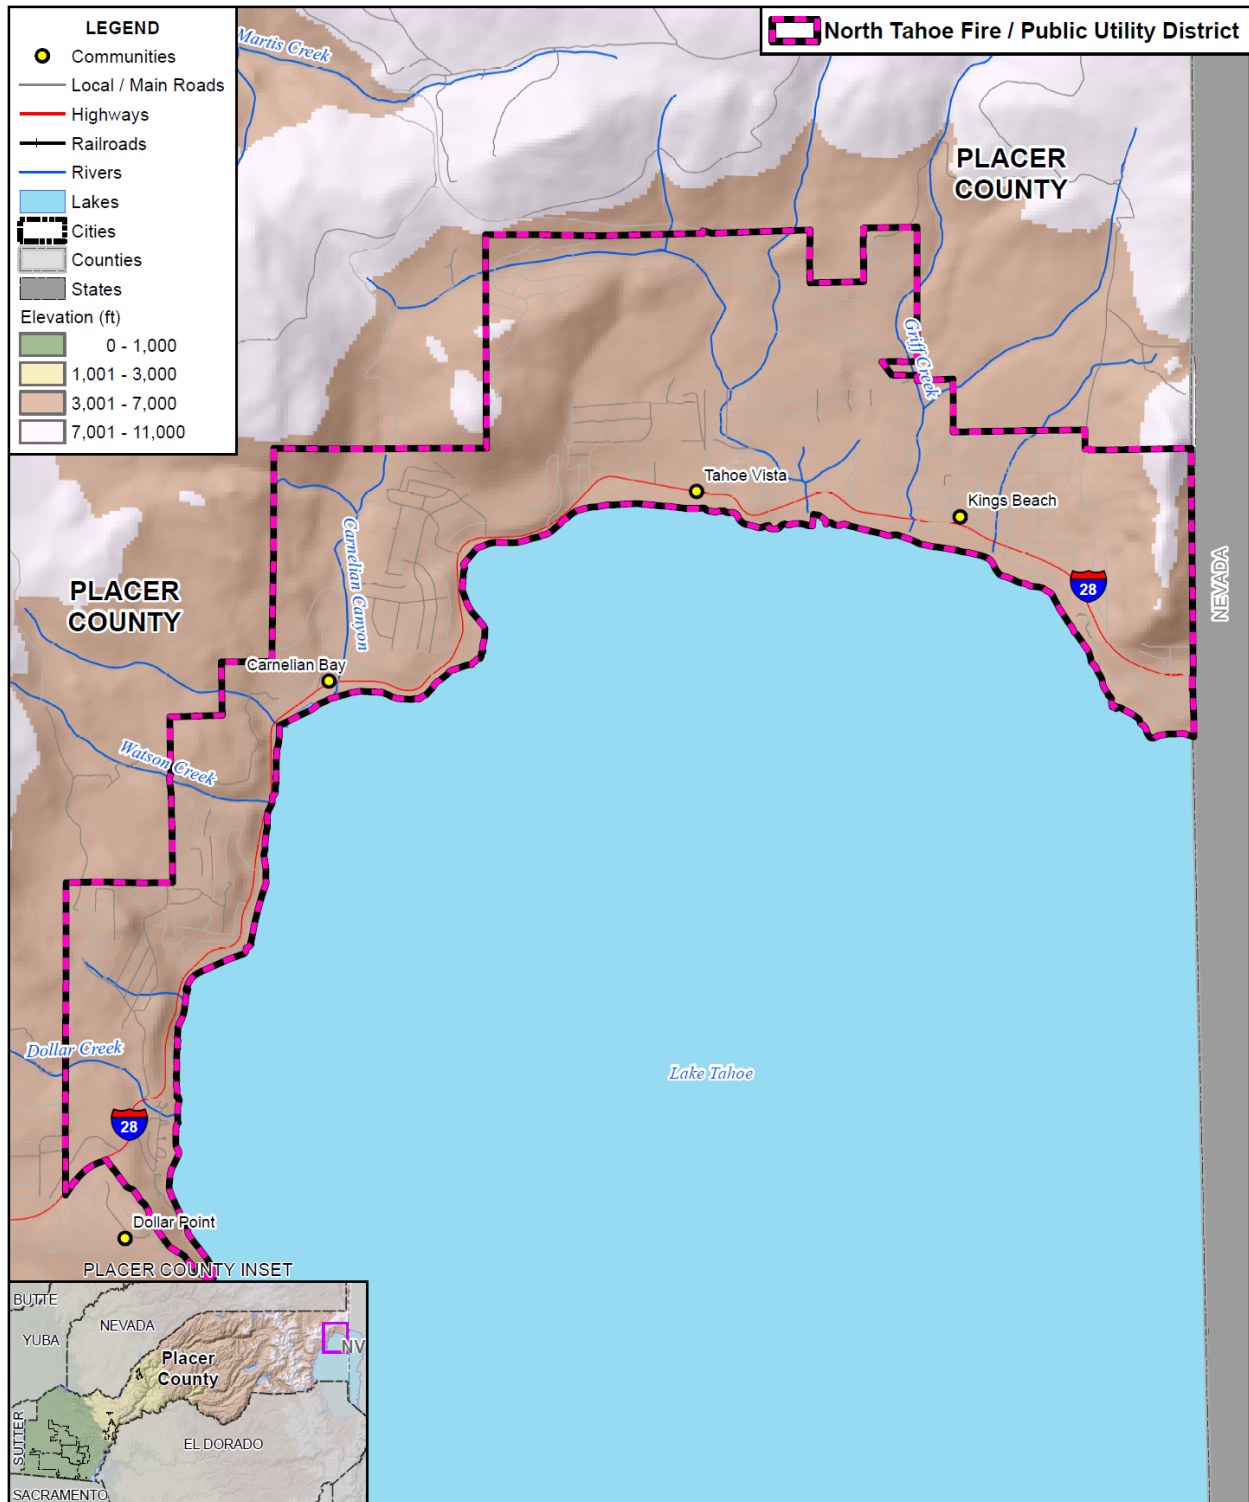

Table N-2 2016 LHMP Incorporation

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
N/A	No mitigation related planning mechanisms have been completed since 2016

N.3 District Profile

The District profile for the NTPUD is detailed in the following sections. Figure N-1 displays a map and the location of the District within Placer County.

Figure N-1 NTPUD

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

N.3.1. Overview and Background

The North Tahoe Public Utility District (NTPUD) was formed in 1948 under the State of California Public Utilities Code to provide sewer services to the residents of the north shore of Lake Tahoe. The District's boundaries range from the Nevada state line in Crystal Bay to Dollar Hill. Our service area includes the communities of Kings Beach, Tahoe Vista, Brockway Vista, Carnelian Bay, Cedar Flat and Agate Bay.

In November of 1967, water services were added to the District's responsibility with the Recreation and Parks Department being created in 1968. The District manages and maintains most of the public beaches in our service area as well as the North Tahoe Regional Park in Tahoe Vista.

The North Tahoe Event Center is also owned and managed by the District. The District currently serves 5,467 sewer connections and 3,948 metered water connections.

N.4 Hazard Identification

NTPUD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table N-3).

Table N-3 NTPUD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Limited	Unlikely	Negligible	Low	Medium
Avalanche	Limited	Unlikely	Negligible	Low	Medium
Climate Change	Extensive	Occasional	Negligible	Low	–
Dam Failure	Limited	Unlikely	Negligible	Low	Medium
Drought & Water Shortage	Significant	Likely	Critical	High	High
Earthquake	Extensive	Occasional	Critical	High	Low
Floods: 1%/0.2% annual chance	Significant	Unlikely	Limited	Medium	Medium
Floods: Localized Stormwater	Significant	Occasional	Limited	Medium	Medium
Landslides, Mudslides, and Debris Flows	Limited	Occasional	Negligible	Low	Medium
Levee Failure	Limited	Unlikely	Negligible	Low	Medium
Pandemic	Extensive	Occasional	Limited	Medium	Medium
Seiche	Limited	Unlikely	Limited	Medium	Medium
Severe Weather: Extreme Heat	Limited	Unlikely	Negligible	Medium	High
Severe Weather: Freeze and Snow	Extensive	Highly Likely	Negligible	Medium	Medium
Severe Weather: Heavy Rains and Storms	Significant	Likely	Negligible	Low	Medium
Severe Weather: High Winds and Tornadoes	Limited	Occasional	Negligible	Low	Low
Tree Mortality	Significant	Likely	Limited	Medium	High
Wildfire	Significant	Likely	Critical	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

N.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District’s hazards and assess the District’s vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

N.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section N.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table N-3) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

N.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District’s total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the NTPUD’s assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table N-4 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. NTPUD’s physical assets, valued at over \$17 million, consist of the buildings and infrastructure to support the District’s operations.

Table N-4 NTPUD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
Base Administration Facilities	District Operations Base	\$3,913,767	Severe Weather
National Avenue Water Treatment Plant	Potable Water Intake & Treatment Plant	\$1,617,000	Seiche Flood
Park Well	Potable Water Well and Emergency Generator	\$310,000	Wildfire Drought
Park Tank	Potable Water Tank	\$200,000	Wildfire
Carnelian Woods Well	Potable Water Well	\$206,000	Wildfire Drought
Carnelian Woods Tank I	Potable Water Tank	\$200,000	Wildfire
Carnelian Woods Tank II	Potable Water Tank & Booster Pump Station	\$400,000	Wildfire
Dollar Hill Tank	Potable Water Tank	\$225,000	Wildfire
Dollar Cove Water Intake (currently inactive)	Potable Water Intake & Pump House	\$100,000	Soil Bank Erosion Drought
Brockway Water Intake (currently inactive)	Potable Water Intake & Pump House	\$75,000	Soil Bank Erosion Drought Seiche
Kings Beach Tank	Potable Water Tank	\$200,000	Wildfire
Zone 1 Tank	Potable Water Tank & Booster Pump Station	\$450,000	Wildfire
Zone 2 Tank	Potable Water Tank	\$200,000	Wildfire
Kingswood West Water Tank	Potable Water Tank	\$400,000	Wildfire
Kingswood West Booster Pump Station	Potable Water Booster Pump Station	\$147,900	Wildfire
Secline Sewer Pump Station	Sewer Pump Station	\$385,000	Severe Weather Flood: Localized Stormwater Flooding Seiche

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
National Sewer Pump Station	Sewer Pump Station	\$675,000	Severe Weather Flood: Localized Stormwater Flooding Seiche
Carnelian Sewer Pump Station	Sewer Pump Station	\$505,900	Severe Weather Flood: Localized Stormwater Flooding
Dollar Sewer Pump Station	Sewer Pump Station	\$488,000	Severe Weather Flood: Localized Stormwater Flooding
S1, S2, N2, C1, D1, D2, D3, D4, D5, D6, D7 Satellite Sewer Pump Stations	Model 15 and Model 16 Satellite Sewer Pump Stations	Model 15: \$32,000/ea Model 16: \$101,350/ea	Severe Weather
N1 Satellite Pump Station	Model 16 Satellite Sewer Pump Station with Backup Generator	\$136,350	Severe Weather
N3 Satellite Pump Station	Model 16 Satellite Sewer Pump Station with Backup Generator	\$126,350	Severe Weather
C2 Satellite Pump Station	Model 16 Satellite Sewer Pump Station with Backup Generator	\$181,350	Severe Weather
North Tahoe Event Center	Community Conference Center & Emergency Evacuation Shelter	\$2,405,000	Severe Weather (wind) Seiche Flood
Tahoe Vista Recreation Area	Beach & Facilities, Boat Launch, & Parking Areas	\$289,000	Severe Weather Seiche Flood
Secline Beach Park	Park	\$10,000	Flood Seiche
North Tahoe Regional Park	Park with numerous amenities	\$1,913,559	Wildfire

Source: NTPUD

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. NTPUD provides services to residential, commercial, and visitors to North Lake Tahoe. Services provided includes sewer collection and pumping, domestic water, and fire suppression facilities.

Natural Resources

NTPUD has a variety of natural resources of value to the District. These natural resources parallel that of the Tahoe area of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan

Historic and Cultural Resources

NTPUD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan. There is no growth occurring, therefore no expansion of facilities. There is infill development and redevelopment that is served by the existing infrastructure.

Development since 2016

No District facilities have been constructed since 2016. The District continues to rehabilitate existing facilities and improve fire suppression capabilities.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. There is no growth occurring, therefore no expansion of facilities. There is infill development and redevelopment that is served by the existing infrastructure. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

N.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table N-3 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.

- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Drought & Water Shortage

Likelihood of Future Occurrence—Likely

Vulnerability—High

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area’s usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table N-5.

Table N-5 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

As a public water purveyor, droughts and water shortages may have an impact on the District's well water levels during prolonged drought conditions. It is doubtful it would have an impact on the District's lake intake due to the length of the intake and the District's pumps are submersible.

Assets at Risk

Assets at risk from droughts are the Park Well and Carnelian Woods Well due to low groundwater levels.

Earthquake

Likelihood of Future Occurrence—Occasional

Vulnerability—High

Hazard Profile and Problem Description

An earthquake is caused by a sudden slip on a fault. Stresses in the earth's outer layer push the sides of the fault together. Stress builds up, and the rocks slip suddenly, releasing energy in waves that travel through the earth's crust and cause the shaking that is felt during an earthquake. Earthquakes can cause structural damage, injury, and loss of life, as well as damage to infrastructure networks, such as water, power, gas, communication, and transportation. Earthquakes may also cause collateral emergencies including dam and levee failures, seiches, hazmat incidents, fires, avalanches, and landslides. The degree of damage depends on many interrelated factors. Among these are: the magnitude, focal depth, distance from the causative fault, source mechanism, duration of shaking, high rock accelerations, type of surface deposits or bedrock, degree of consolidation of surface deposits, presence of high groundwater, topography, and the design, type, and quality of building construction.

Location and Extent

The amount of energy released during an earthquake is usually expressed as a magnitude and is measured directly from the earthquake as recorded on seismographs. An earthquake's magnitude is expressed in whole numbers and decimals (e.g., 6.8). Seismologists have developed several magnitude scales, as discussed in Section 4.3.11 of the Base Plan. Placer County itself is traversed by a series of northwest-trending faults, called the Foothill Fault Zone, that are related to the Sierra Nevada uplift. This was the source of Oroville's 1975 earthquake (and an earlier event in the 1940s). Subsequent research of these events led to the identification and naming of the zone and questions about the siting and design of the proposed Auburn Dam. Earthquakes on nearby fault segments in the zone could be the source of ground shaking in the Placer County Planning Area.

Although portions of western and eastern Placer County are located in a seismically active region, no known faults actually go through any of the cities or towns. However, the Bear Mountain and the Melones faults are situated approximately three to four miles west and east of the City of Auburn respectively. Earthquakes on these two faults would have the greatest potential for damaging buildings in Auburn, especially the unreinforced masonry structures in the older part of the city and homes built before 1960 without adequate anchorage of framing and foundations. Similar lower magnitude but nearby earthquakes are capable of producing comparable damages in other Placer County communities.

Another measure of earthquake severity is intensity. Intensity is an expression of the amount of shaking at any given location on the ground surface. Seismic shaking is typically the greatest cause of losses to structures during earthquakes. Seismic shaking maps for the area show Placer County and the District fall within a moderate shake risk.

Past Occurrences

There have been no past federal or state disaster declarations from this hazard. The District noted no past occurrences of earthquakes or that affected the District in any meaningful way.

Vulnerability to and Impacts from Earthquake

The combination of plate tectonics and associated California coastal mountain range building geology generates earthquake as a result of the periodic release of tectonic stresses. Placer County lies in the center of the North American and Pacific tectonic plate activity. There have been earthquakes as a result of this activity in the historic past, and there will continue to be earthquakes in the future of the California north coastal mountain region.

Fault ruptures itself contributes very little to damage unless the structure or system element crosses the active fault; however, liquefaction can occur further from the source of the earthquake. In general, newer construction is more earthquake resistant than older construction due to enforcement of improved building codes. Manufactured buildings can be very susceptible to damage because their foundation systems are rarely braced for earthquake motions. Locally generated earthquake motions and associated liquefaction, even from very moderate events, tend to be more damaging to smaller buildings, especially those constructed of unreinforced masonry (URM) and soft story buildings. The District noted that there may be URM, but a seismic analysis would need to be completed to identify which structures. The only building identified so far is the Base Annex building which houses emergency response equipment.

The Uniform Building Code (UBC) identifies four seismic zones in the United States. The zones are numbered one through four, with Zone 4 representing the highest level of seismic hazard. The UBC establishes more stringent construction standards for areas within Zones 3 and 4. All of California lies within either Zone 3 or Zone 4. The NTPUD is within the less hazardous Zone 3.

Impacts from earthquake in the District will vary depending on the fault that the earthquake occurs on, the depth of the earthquake strike, and the intensity of shaking. Large events could cause damages to infrastructure, critical facilities, residential and commercial properties, and possible injuries or loss of life.

Assets at Risk

A seismic analysis would need to be completed to identify which structures may be at risk from Earthquakes. The only asset currently identified for retrofit is the Base Annex building which houses emergency response equipment; such as portable generators, portable pumps, and other emergency response equipment. The National Sewer Pump Station block building is being reinforced with a capital project in 2021. It is expected there could be substantial water pipeline and sewer pipeline breaks and failures as a result of ground movement which would have a high impact on service.

Flood: 1%/0.2% Annual Chance

Likelihood of Future Occurrence—Occasional/Unlikely

Vulnerability—Medium

Hazard Profile and Problem Description

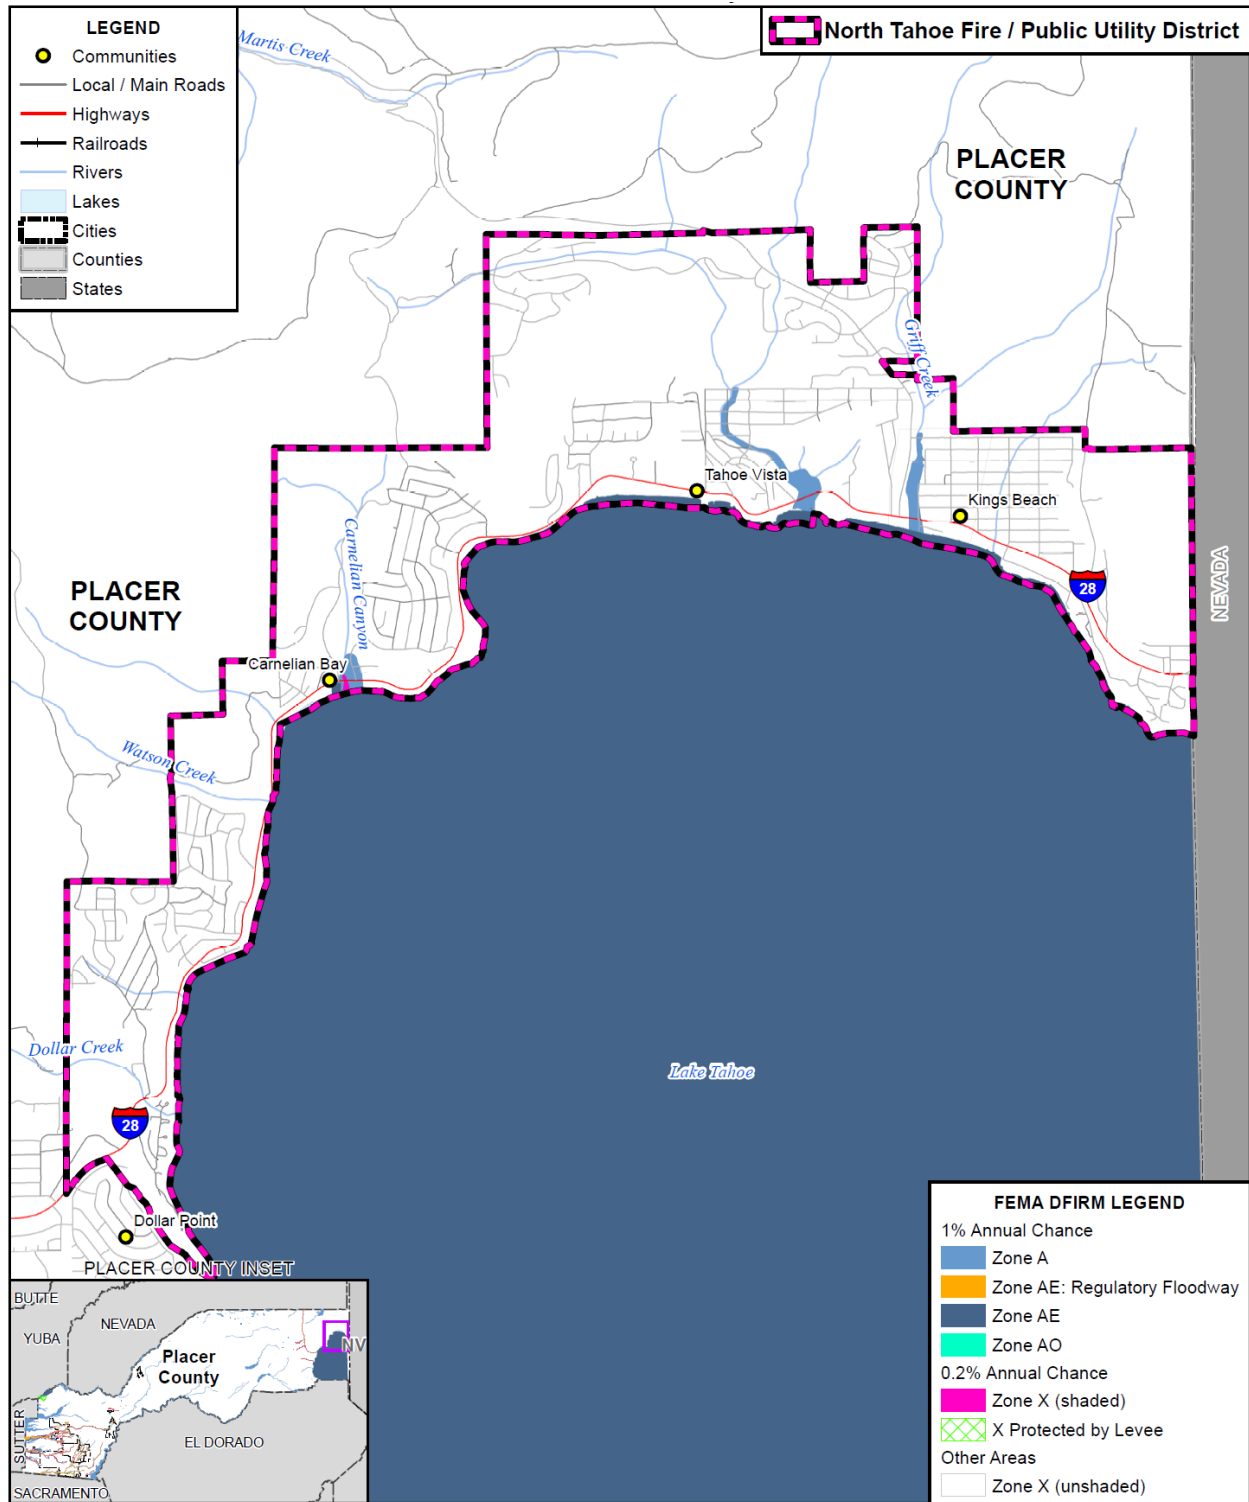

This hazard analyzes the FEMA DFIRM 1% and 0.2% annual chance floods. These tend to be the larger floods that can occur in the County or in the District, and have caused damages in the past. Flooding is a significant problem in Placer County and the District. Historically, the District has been at risk to flooding primarily during the winter and spring months when river systems in the County swell with heavy rainfall and snowmelt runoff. Normally, storm floodwaters are kept within defined limits by a variety of storm drainage and flood control measures. Occasionally, extended heavy rains result in floodwaters that exceed normal high-water boundaries and cause damage.

As previously described in Section 4.3.12 of the Base Plan, the Placer County Planning Area and the NTPUD have been subject to historical flooding.

Location and Extent

The NTPUD has areas located in the 1% annual chance floodplain. This is seen in Figure N-2.

Figure N-2 NTPUD – FEMA DFIRM Flood Zones

Data Source: FEMA DFIRM 11/2/2018, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Table N-6 details the DFIRM mapped flood zones within the 1% annual chance flood zone as well as other flood zones located within the District.

Table N-6 NTPUD– DFIRM Flood Hazard Zones

Flood Zone	Description	Flood Zone Present in the District
A	Areas subject to inundation by the 1% annual-chance flood event generally determined using approximate methodologies. Because detailed hydraulic analyses have not been performed, no Base Flood Elevations (BFEs) or flood depths are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	
AE – Regulatory Floodway	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply. Different from AE in that it adds the water course and adjacent lands that must be reserved in order to discharge the base flood without increasing the water surface elevation by more than one foot.	
AH	An area inundated by 1% annual chance flooding (usually an area of ponding), for which BFEs have been determined; flood depths range from 1 to 3 feet	
AO	Areas subject to inundation by 100-year shallow flooding (usually sheet flow on sloping terrain) where average depths are between one and three feet	
Shaded X	500-year flood the areas between the limits of the 1% annual chance flood and the 0.2-percent-annual-chance (or 500-year) flood	
X Protected by Levee	An area determined to be outside the 500-year flood and protected by levee from 100-year flood	
X	Areas outside of known floodplains.	X

Source: FEMA

Additionally, flood extents can generally be measured in volume, velocity, and depths of flooding. Expected flood depths in the District vary, depending on the nature and extent of a flood event; specific depths are unknown. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Flooding in the District tends to have a shorter speed of onset, due to the amount of water that flows through the District.

Past Occurrences

A list of state and federal disaster declarations for Placer County from flooding is shown on Table N-7. These events also likely affected the District to some degree.

Table N-7 Placer County – State and Federal Disaster Declarations from Flood 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Flood (including heavy rains and storms)	16	1950, 1955, 1958 (twice), 1962, 1963, 1969, 1973, 1980, 1983, 1986, 1995 (twice), 1997, 2008, 2017	13	1955, 1958, 1962, 1964, 1969, 1983, 1986, 1995 (twice), 1997, 2006 (twice), 2017

Source: Cal OES, FEMA

January 1997 – A USGS Report titled Flood of January 1997 in the Lake Tahoe Basin, California and Nevada (Fact Sheet FS-005-98) contained the following information on a January 1997 flood event: Northern California and western Nevada, including the Lake Tahoe Basin, were affected by floods during January 1-3, 1997. In the two California counties surrounding Lake Tahoe, El Dorado and Placer, about \$91 million in estimated damage was attributed to flood waters (Reno Gazette-Journal, May 30, 1997). Flooding in the Lake Tahoe Basin was mainly along the Upper Truckee River in the city of South Lake Tahoe (Tahoe Daily Tribune, January 7, 1997). In late December 1996, several storms produced a large snowpack (more than 180 percent of normal) in higher altitudes of the Sierra Nevada (Daniel Greenlee, Natural Resource Conservation Service, oral commun., 1997). Valleys along the eastern Sierra Nevada front were covered with a large snowpack as well. A subtropical storm system originating in the central Pacific Ocean near the Hawaiian Islands then brought heavy rain to the Sierra Nevada from December 30, 1996, through January 3, 1997. During this period, the Natural Resource Conservation Service recorded 27.7 in. (provisional data; Daniel Greenlee, oral commun., 1997) of precipitation at Squaw Valley, Calif. (8,200 ft above sea level), and the National Weather Service recorded 11.6 in. (Gary Barbate, oral commun., 1997) at Tahoe City, Calif. (6,230 ft). Rain falling below 10,000 ft depleted about 20 percent of the high-altitude snowpack between 7,000 and 10,000 feet and melted about 80 percent of the snowpack below 7,000 ft. The level of Lake Tahoe rose more than a foot during the storm, to 6,229.40 ft (Bureau of Reclamation datum), the highest elevation since 1917, and more than the maximum permissible by Federal Court decree (6,229.10 ft). The peak for the period of record (1900-97) for Lake Tahoe at Tahoe City, Calif, is 6,231.26 ft in July 1907.

December 2005/January 2006 – A very brief but productive storm period in early December and a much more prolonged wet and stormy period spanning Dec 17th through the 2nd of January 2006 brought copious rainfall to northern California, southwest Oregon, and western Nevada. Initially, the generally dry antecedent soil moisture conditions and the spacing between storms of mid to late December allowed rivers to rise and fall with only minor consequences. However, river flows ratcheted higher with each passing storm to the point where a larger storm occurring on the 28th of December and an even wetter New Year's Eve storm would drive several rivers to rise well above flood stages with high inflows into northern Sierra Nevada reservoirs. Advanced releases in anticipation of the heavy rains and weir flows into the bypass system allowed the major controlled river systems like the Sacramento, Feather, and American watersheds to weather the storm without major incidents. However, the smaller and quicker responding rivers such as the Russian and Napa Rivers were exposed to the direct impact of these storms and resulted in major flooding. Several rivers along California's north coast including the Klamath River and the Eel River rose several feet above flood stage and rivaled flows dating back to the December 1996 - January 1997 flood event. In addition, more localized flood damage occurred as many of the area's smaller creeks and streams overflowed into neighborhoods and streets, including the San Francisco Bay Area and greater Sacramento

area. The heavy rains also posed a major problem for area transportation with several road closures due to rock and mud slides. A mudslide on the 30th temporarily closed Interstate 5 north of the Oregon border and a large rockslide closed Interstate 80 near Floriston east of Truckee for about a day and a half. Westbound lanes of Interstate 80 in Fairfield, CA sat under four feet of water forcing the CHP to shut down the major thoroughfare between Sacramento and San Francisco on the 31st.

Vulnerability to and Impacts from Flood

Floods have been a part of the District's historical past and will continue to be so in the future. During winter months, long periods of precipitation and the timing of that precipitation are critical in determining the threat of flood, and these characteristics further dictate the potential for widespread structural and property damages. Predominantly, the effects of flooding are generally confined to areas near the waterways of the County. As waterways grow in size from local drainages, so grows the threat of flood and dimensions of the threat. This threatens structures in the floodplain. Structures can also be damaged from trees falling as a result of water-saturated soils. Electrical power outages happen, and the interruption of power causes major problems. Loss of power is usually a precursor to closure of governmental offices and community businesses. Roads can be damaged and closed, causing safety and evacuation issues. People may be swept away in floodwaters, causing injuries or deaths.

Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits. Direct impacts, such as drowning, can be limited with adequate warning and public education about what to do during floods. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, loss of environmental resources, and economic impacts.

Assets at Risk

The District has a number of critical sewer and water facilities near the shoreline of Lake Tahoe that may be subject to flooding during a 100/500 year storm. Floodwaters could inundate the sewer pump stations, making it difficult to keep up with pumping the sewage out of the Tahoe Basin. Likewise, the District's water treatment plant is on the shoreline underground, making it susceptible to flooding during a 100/500 year storm. Power outages would also affect the District's ability to keep sewer and water pump stations operational, which would have an impact on District customers.

For the most part, the larger sewer pumping and many of the small sewer pumping facilities are located adjacent to the shoreline of Lake Tahoe where flooding would be very minimal that could impact the facility, since it would all drain to the lake and the lake will not rise any measurable amount. The risk is from the inundation of flood waters into the sewer system that overwhelms the conveyance facilities. Water tanks are located along ridge lines and sited on prepared pads that keep them at low risk from floodwaters.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

Flooding occurs in areas other than the FEMA mapped 1% and 0.2% annual chance floodplains. Flooding may be from drainages not studied by FEMA, lack of or inadequate drainage infrastructure, or inadequate maintenance. Localized, stormwater flooding occurs throughout the County during the rainy season from November through April. Prolonged heavy rainfall contributes to a large volume of runoff resulting in high peak flows of moderate duration.

Location and Extent

The NTPUD is subject to localized flooding throughout the District. Flood extents are usually measured in areas affected, velocity of flooding, and depths of flooding. Expected flood depths in the District vary by location. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Localized flooding in the District tends to have a shorter speed of onset, especially when antecedent rainfall has soaked the ground and reduced its capacity to absorb additional moisture.

Past Occurrences

There have been no federal or state disaster declarations in the County due to localized flooding. The District noted the following past occurrences of localized flooding:

- From **December 31, 2005 to January 6, 2006**, severe flooding occurred in the North Tahoe PUD area. There was snow on the ground in the area at the time of a rain. The rain on snow event caused mild to moderate flood damage in the area. It was considered a 50-year flood event. State Highway 28 was closed due to flooding. Fortunately, schools were already closed for the Christmas holiday. The North Tahoe PUD received reimbursement of \$37,768 from State OES for staff time (regular and overtime) and equipment costs to keep sewer and water pump stations operational during power outages. The HMPC noted that there is a high likelihood of reoccurrence, depending on weather conditions. Additional/alternative fuel supplies should be considered for these types of catastrophic events. All local gas stations ran out of fuel (regular and diesel) and gas trucks were not able to get into the area due to week-long road closures on Interstate 80.

No events since 2016 were noted.

Vulnerability to and Impacts from Localized Flooding

Historically, much of the growth in the District and County has occurred adjacent to streams, resulting in significant damages to property, and losses from disruption of community activities when the streams overflow. Additional development in the watersheds of these streams affects both the frequency and duration of damaging floods through an increase in stormwater runoff.

Primary concerns associated with stormwater flooding include life safety issues, and impacts to property and to infrastructure that provides a means of ingress and egress throughout the community. Ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Objects can also be buried or destroyed through sediment deposition. Floodwaters can break utility lines and interrupt services. Standing water can cause damage to crops, roads, and foundations. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

Assets at Risk

The District has a number of critical sewer and water facilities near the shoreline of Lake Tahoe that may be subject to flooding during localized stormwater flooding. Floodwaters could inundate the sewer pump stations, making it difficult to keep up with pumping the sewage out of the Tahoe Basin. Likewise, the District's water treatment plant is on the shoreline underground, making it susceptible to flooding during localized stormwater flooding. Power outages would also affect the District's ability to keep sewer and water pump stations operational, which would have an impact on District customers.

For the most part the larger sewer pumping and many of the small sewer pumping facilities are located adjacent to the shoreline of Lake Tahoe where flooding would be very minimal that could impact the facility, since it would all drain to the lake and the lake will not rise any measurable amount. The risk is from the inundation of flood waters into the sewer system that overwhelms the conveyance facilities. Water tanks are located along ridge lines and sited on prepared pads that keep them at low risk from floodwaters.

Pandemic

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

According to the World Health Organization (WHO), a disease epidemic occurs when there are more cases of that disease than normal. A pandemic is a worldwide epidemic of a disease. A pandemic may occur when a new virus appears against which the human population has no immunity.

A pandemic occurs when a new virus emerges for which people have little or no immunity, and for which there is no vaccine. This disease spreads easily person-to-person, causes serious illness, and can sweep across the country and around the world in a very short time. The U.S. Centers for Disease Control (CDC) and Prevention has been working closely with other countries and the WHO to strengthen systems to detect outbreaks of that might cause a pandemic and to assist with pandemic planning and preparation. An especially severe pandemic could lead to high levels of illness, death, social disruption, and economic loss.

Location and Extent

During a pandemic, the whole of the District, County, and surrounding region is at risk, as pandemic is a regional, national, and international event. The speed of onset of pandemic is usually short, while the duration is variable, but can last for more than a year as shown in the 1918/1919 Spanish Flu. There is no

scientific scale to measure the magnitude of pandemic. Pandemics are usually measured in numbers affected by the pandemic, and by number who die from complications from the pandemic.

Past Occurrences

There has been one state and federal disaster declaration due to pandemic, as shown in Table N-8.

Table N-8 Placer County – State and Federal Pandemic Disaster Declarations 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Pandemic	1	2020	1	2020

Source: Cal OES, FEMA

The 20th century saw three outbreaks of pandemic flu.

- The 1918-1919 Influenza Pandemic (H1N1)
- The February 1957-1958 Influenza Pandemic (H2N2)
- The 1968 Influenza Pandemic (H3N2)

To date, the 21st century has seen two acknowledged pandemics.

- 2009 Swine Flu (H1N1)
- 2019/2020 COVID 19

The District was not affected by the 2009 Swine Flu. During the 2019/2020 COVID 19 pandemic, the District closed the Administration building and North Tahoe Event Center to the public except by appointment only, began sanitizing work-stations and facilities several times each day, established remote working for office staff, instituted mandatory mask wearing and social distancing for all staff, closed all playgrounds, and cancelled all sporting and social events. The District has a CalOSHA Covid-19 Prevention Program.

Vulnerability to and Impacts from Pandemic

Pandemics have and will continue to have impacts on human health in the region. A pandemic occurs when a new virus emerges for which there is little or no immunity in the human population; the virus causes serious illness and spreads easily from person-to-person worldwide. There are several strategies that public health officials can use to combat a pandemic. Constant surveillance regarding the current pandemic, use of infection control techniques, and administration of vaccines once they become available. Citizens can help prevent the spread of a pandemic by staying home, or “self-quarantining,” if they suspect they are infected. Pandemic does not affect the buildings, critical facilities, and infrastructure in the District. Pandemic can have varying levels of impact to the citizens of the District and greater County, depending on the nature of the pandemic.

Impacts could range from school and business closings to the interruption of basic services such as public transportation, health care, and the delivery of food and essential medicines. Hospitalizations and deaths can occur, especially to the elderly or those with pre-existing underlying conditions. As seen with Covid-

19, multiple businesses were forced to close temporarily (some permanently), and unemployment rose significantly. Supply chains for food and essentials can be interrupted. Prisons may need to release prisoners to prevent significant outbreaks.

Assets at Risk

Pandemics do not affect District facilities, but can affect District personnel who operate District facilities.

Seiche

Likelihood of Future Occurrence–Unlikely

Vulnerability–Medium

Hazard Profile and Problem Description

U.S. Army Corps of Engineers defines seiche as:

- A standing wave oscillation of an enclosed water body that continues, pendulum fashion, after the cessation of the originating force, which may have been either seismic or atmospheric.
- An oscillation of a fluid body in response to a disturbing force having the same frequency as the natural frequency of the fluid system. Tides are now considered to be seiches induced primarily by the periodic forces caused by the sun and moon.
- In the Great Lakes area, any sudden rise in the water of a harbor or a lake whether or not it is oscillatory (although inaccurate in a strict sense, this usage is well established in the Great Lakes area).

Seiches can be generated when the water is subject to changes in wind or atmospheric pressure gradients or, in the case of semi-enclosed basins, by the oscillation of adjacent connected water bodies having a periodicity close to that of the seiche or of one of its harmonics. Other, less frequent causes of seiches include heavy precipitation over a portion of the lake, flood discharge from rivers, seismic disturbances, submarine mudslides or slumps, and tides. The most dramatic seiches have been observed after earthquakes and large landslide events.

Location and Extent

Within Placer County, locations with the highest probability of impact are shore areas of Lake Tahoe from 0 to 30 feet above mean lake water level. Speed of onset of seiche is short. The duration of the event tends to be short as well, continuing until the waves naturally dissipate.

Past Occurrences

There have been no state or federal disasters in the County related to seiche. No events of past seiche have affected the District.

Vulnerability to and Impacts from Seiche

Research from the University of Nevada estimates that an earthquake must be at least a magnitude 6.5 to cause a damaging seiche at Lake Tahoe. The two faults directly underneath the lake are considered capable

of generating magnitude 7.1 earthquakes. Computer models of seiche activity at Lake Tahoe prepared by the University of Nevada research team estimate that waves as high as 30 feet could strike the shore. These projections suggest largest waves might hit Sugar Pine Point, Rubicon Point and the casinos in South Lake Tahoe. The seiche risk is potentially devastating as hundreds of houses are built along the lake and more than 17,000 people enjoy the Lake Tahoe shoreline every day in the summer.

Potential impacts of a seiche could affect sewer and water facilities in close proximity to the lake. A seiche may also impact the North Tahoe Event Center, which is the region's emergency shelter and evacuation center. The impacts could be severe if the wave compromises the control buildings and destroys electrical equipment, generators and communications equipment. The District does have an alternative groundwater supply that can provide for base water use. Emergency equipment can be set up for sewer bypass operations in case of failure of lakeside sewer pumping stations. There are significant Liberty Energy power lines along North Lake Blvd that could be impacted causing widespread power loss, which could impact District facilities.

Assets at Risk

District assets at risk due to a seiche are the National Avenue Water Treatment Plant, Secline Sewer Pump Station, National Avenue Sewer Pump Station, North Tahoe Event Center, Tahoe Vista Recreation Area, and Secline Beach Park. Loss of Liberty Energy power line along North Lake Blvd could cause widespread power loss and potentially affect every District facility.

Severe Weather: Extreme Heat

Likelihood of Future Occurrence—Unlikely

Vulnerability—Medium

Hazard Profile and Problem Description

According to FEMA, extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. Heat kills by taxing the human body beyond its abilities. In extreme heat and high humidity, evaporation is slowed, and the body must work extra hard to maintain a normal temperature.” Most heat disorders occur because the victim has been overexposed to heat or has over-exercised for his or her age and physical condition. Older adults, young children, and those who are sick or overweight are more likely to succumb to extreme heat.

In addition to the risks faced by citizens of the District, there are risk to the built environment from extreme heat. While extreme heat on its own does not usually affect structure, extreme heat during times of drought can cause wildfire risk to heighten. Extreme heat and high winds can cause power outages and PSPS events, causing issues to buildings in the District.

Extreme Heat and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least

50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Location and Extent

Heat is a regional phenomenon and affects the whole of the District. Heat emergencies are often slower to develop, taking several days of continuous, oppressive heat before a significant or quantifiable impact is seen. Heat waves do not strike victims immediately, but rather their cumulative effects slowly affect vulnerable populations and communities. Heat waves do not generally cause damage or elicit the immediate response of floods, fires, earthquakes, or other more "typical" disaster scenarios.

The NWS has in place a system to initiate alert procedures (advisories or warnings) when extreme heat is expected to have a significant impact on public safety. The expected severity of the heat determines whether advisories or warnings are issued. The NWS HeatRisk forecast provides a quick view of heat risk potential over the upcoming seven days. The heat risk is portrayed in a numeric (0-4) and color (green/yellow/orange/red/magenta) scale which is similar in approach to the Air Quality Index (AQI) or the UV Index. This can be seen in Section 4.3.2 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for heat. The District Planning Team noted that since extreme heat is a regional phenomenon, events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.2.

Vulnerability to and Impacts from Extreme Heat

The District experiences temperatures in excess of 90°F during the summer and fall months. During these times, drought conditions may worsen. Also, power outages and PSPS events may occur during these times as well. Health impacts, including loss of life, are the primary concern with this hazard, though economic impacts are also an issue.

Days of extreme heat have been known to result in medical emergencies, and unpredictable human behavior. Periods of extended heat and dryness (droughts) can have major economic, agricultural, and water resources impacts. Extreme heat can also dry out vegetations, making it more vulnerable to wildfire ignitions.

Assets at Risk

The District does not have any assets at risk from extreme heat. However, if during a PSPS event, the District has several assets at risk due to lack of permanent emergency generators. Those assets include the North Tahoe Event Center, water booster pump stations and satellite sewer pump stations. The District does have portable generators for the satellite sewer and water booster pump stations.

Severe Weather: Freeze and Snow

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to the NWS and the WRCC, winter snowstorms can include heavy snow, ice, and blizzard conditions. Heavy snow can immobilize a region, stranding commuters, stopping the flow of supplies, and disrupting emergency and medical services. Accumulations of snow can collapse roofs and knock down trees and power lines. In rural areas, homes and farms may be isolated for days, and unprotected livestock may be lost. The cost of snow removal, damage repair, and business losses can have a tremendous impact on cities and towns.

Heavy accumulations of ice can bring down trees, electrical wires, telephone poles and lines, and communication towers. Communications and power can be disrupted for days until the damage can be repaired. Power outages can have a significant impact on communities, especially critical facilities such as public utilities. Even small accumulations of ice may cause extreme hazards to motorists and pedestrians.

Some winter storms are accompanied by strong winds, creating blizzard conditions with blinding wind-driven snow, severe drifting, and dangerous wind chills. Strong winds accompanying these intense storms and cold fronts can knock down trees, utility poles, and power lines. Blowing snow can reduce visibility to only a few feet in areas where there are no trees or buildings. Serious vehicle accidents with injuries and deaths can result. Freezing temperatures can cause significant damage to the agricultural industry.

Location and Extent

Freeze and snow are regional issues, meaning the entire District is at risk to cold weather and freeze events. While there is no scale (i.e. Richter, Enhanced Fujita) to measure the effects of freeze, the WRCC reports that in a typical year, minimum temperatures fall below 32°F on 209.0 days with 0.4 days falling below 0°F in eastern Placer County. Snowfall is measured in depths, and the WRCC reports that average snowfall on the eastern side of the County is 190.7 inches. Freeze and snow have a slow onset and can generally be predicted in advance for the County. Freeze events can last for hours (in a cold overnight), or for days to

weeks at a time. Snow event can last for hours or days, and the snow stays all winter in the eastern portion of the County, often with significant snow depths.

Past Occurrences

There has been no federal and one state disaster declarations in the County for freeze and snow, as shown on Table N-9.

Table N-9 Placer County – State and Federal Disaster Declarations from Freeze and Snow 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Freeze	1	1972	0	–

Source: Cal OES, FEMA

The District noted that cold and freeze is a regional phenomenon; events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.3. A specific event was recalled by the District:

January 3 – 12, 2017 – Multiple days of heavy snow and power outages District-wide. Communities of Kings Beach, Tahoe Vista, and Carnelian Bay, CA. \$35,995 of damage was suffered by the District, as well as \$22,536 in economic impacts. Business/Economic Impacts cost is for Protective Measures (snow removal, generators, staff overtime, fuel, etc.) to keep critical infrastructure operational during the power outage. These costs were borne by FEMA. No deaths or injuries were recorded.

Vulnerability to and Impacts from Severe Weather: Freeze and Snow

The District experiences temperatures below 32 degrees during the winter months. Freeze can cause injury or loss of life to residents of the District. While it is rare for buildings to be affected directly by freeze, damages to pipes that feed building can be damaged during periods of extreme cold. Freeze and snow can occasionally be accompanied by high winds, which can cause downed trees and power lines, power outages, accidents, and road closures. Transportation networks, communications, and utilities infrastructure are the most vulnerable physical assets to impacts of severe winter weather in the County. Freeze and Snow can cause small water mains to break which affects water services in the surrounding neighborhood. Freeze and snow can also cause power outages which would affect the District’s ability to keep sewer and water pump stations operational, which would have an impact on District customers.

Assets at Risk

The District has several assets at risk due to lack of permanent emergency generators. Those assets include the North Tahoe Event Center, water booster pump stations and satellite sewer pump stations. The District does have portable generators for the satellite sewer and water booster pump stations.

Tree Mortality

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, and contribute to future fuel loads in forests surrounding communities. During extended drought, tree mortality is driven by a build-up in endemic bark beetle populations and exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events.

Location and Extent

Onset of tree mortality events can be relatively fast; however conditions – such as high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas, and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 - 40 dead trees per acre
- Orange depicting 5 -15 dead trees per acre
- Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A number of Placer County areas were designated during this event and the majority of Placer County watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality, along with numerous Tier 1 High hazard “hot spots”. A map of these areas was shown in in Section 4.3.18 of the Base Plan.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015. No events of past tree mortality have affected the District.

Vulnerability to and Impacts from Tree Mortality

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead trees within the wildland urban intermix or wildland urban interface or urban areas therefore pose a greater risk to due to their proximity to residents, businesses, and road, power, and communication infrastructure.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure. Falling trees could damage District facilities in forested areas. They could also block access roads to these facilities. Dead and dying trees could also impact various facilities due to increased risk for catastrophic wildfires.

Assets at Risk

All of the District’s wells, water storage tanks, and the Kingswood West water booster pump station are at risk from Tree Mortality, mainly due to the increased risk of Wildfires and the impacts from them. Also at risk is the North Tahoe Regional Park. Fallen dead wood is a temporary impact.

Wildfire

Likelihood of Future Occurrence–Likely

Vulnerability–High

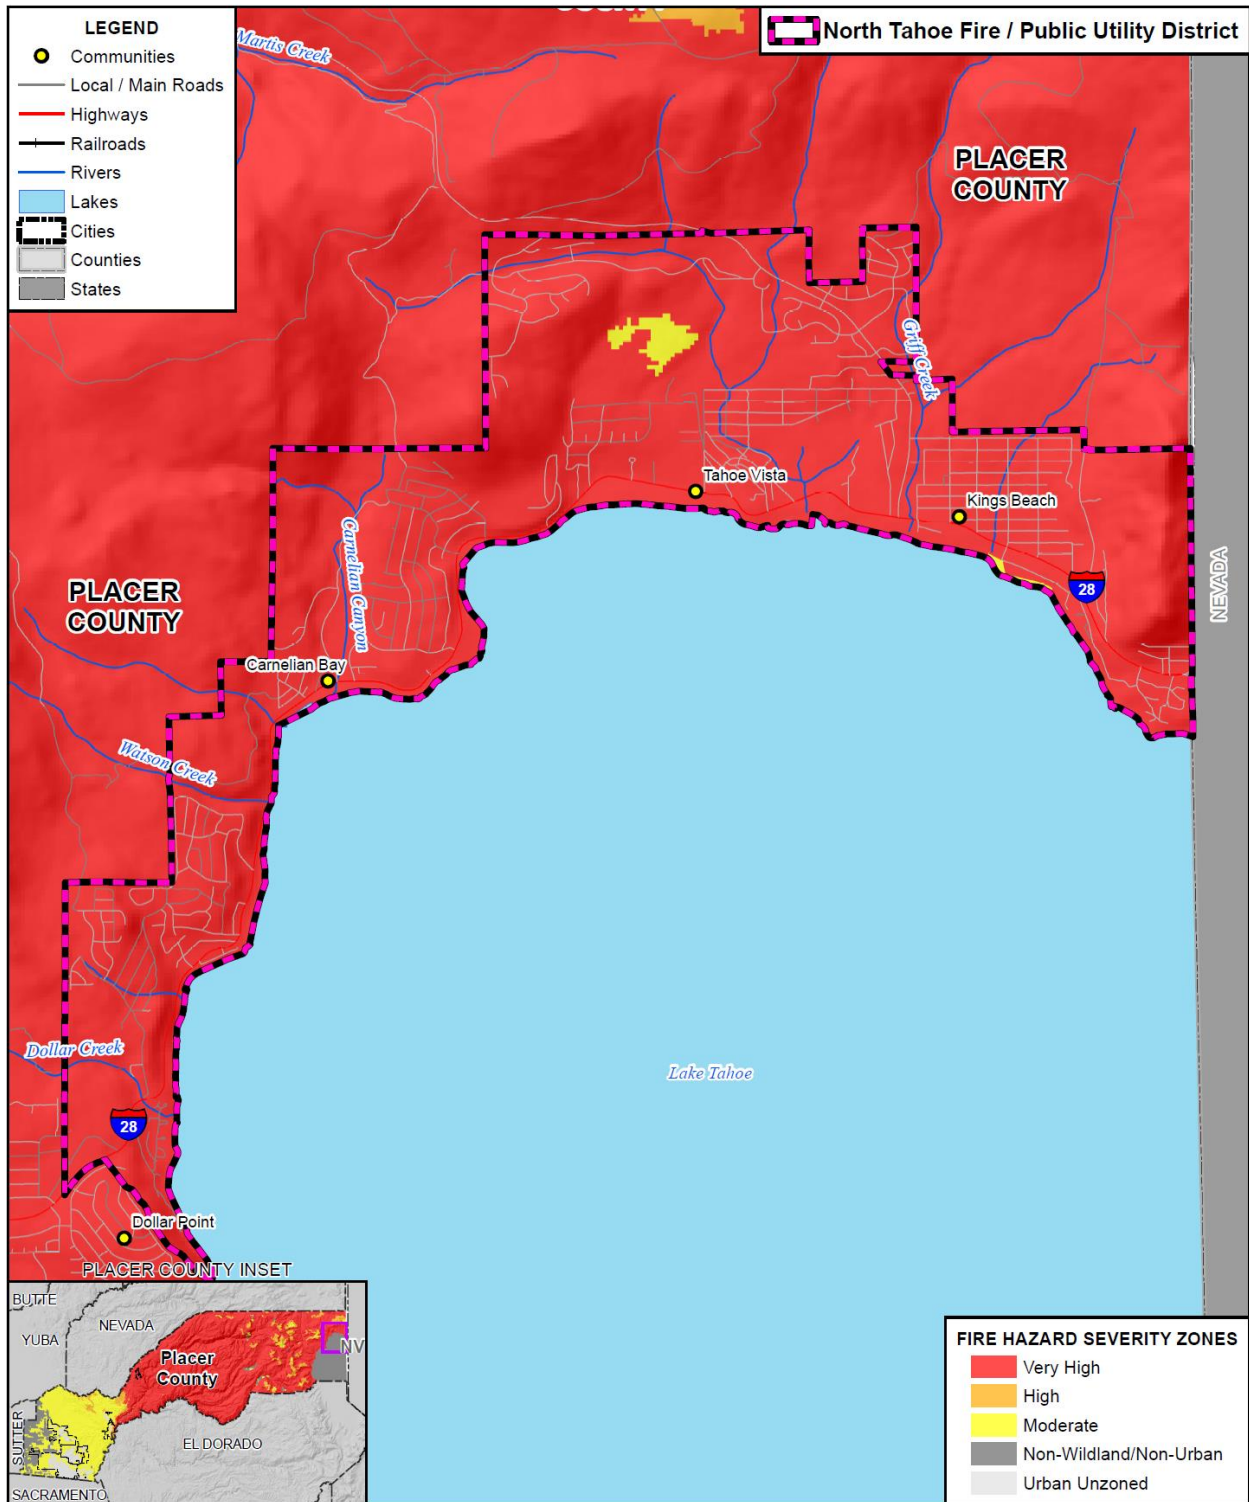

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the NTPUD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the NTPUD were created. Figure N-3 shows the CAL FIRE FHSZ in the District. As shown on the maps, FHSZs within the District range from High to Very High.

Figure N-3 NTPUD – Fire Hazard Severity Zones

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table N-10.

Table N-10 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage

and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

The District has several assets that would be at risk during a wildfire due to the location of existing wooden structures. These assets include the North Tahoe Regional Park, the Park Well building, Kingswood West Booster Pump Station building, and the Carnelian Well building. Wildfire would also cut off access to critical water infrastructure which could impact the District’s ability to provide safe drinking water and fire protection. Structure fires in other areas of the service area also put a large demand on water supplies that impact delivery of potable water to all customers.

Assets at Risk

All of the District’s wells, and Kingswood West water booster pump station and, to a lesser extent, water reservoirs are at a direct risk from Wildfires and the impacts from them. Also at risk is the North Tahoe Regional Park. The impacts that property damage can have on water and sewer assets is high. The destruction of the watershed has the potential of high impact to water quality and severely impacting the National Avenue Water Plant and the ability to provide potable drinking water.

N.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

N.6.1. Regulatory Mitigation Capabilities

Table N-11 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the NTPUD.

Table N-11 NTPUD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	Sewer – 1991 Water - 1999	Can be used to implement mitigation actions, but needs to be updated. These are more planning documents
Capital Improvements Plan	2020	Five-year plan updated each fiscal year.
Economic Development Plan	n/a	County
Local Emergency Operations Plan	2005	The ERP addresses hazards and risks. Never adopted; will be updated in 2021.

Continuity of Operations Plan	No	The District does not have a formal plan. The ERP serves as the guiding document for continuity of operations.
Transportation Plan	n/a	County
Stormwater Management Plan/Program	n/a	County
Engineering Studies for Streams	n/a	County
Community Wildfire Protection Plan	n/a	Fire District
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	Yes	Sanitary Sewer Management Plan Urban Water Management Plan
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	N/A	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N/A	Score:
Fire department ISO rating:	N/A	Rating:
Site plan review requirements	Yes	District Ordinances are adequately enforced for sewer & water
		Is the ordinance an effective measure for reducing hazard impacts?
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	N/A	
Subdivision ordinance	N/A	
Floodplain ordinance	N/A	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N/A	
Flood insurance rate maps	N/A	
Elevation Certificates	N/A	
Acquisition of land for open space and public recreation uses	N/A	
Erosion or sediment control program	N/A	
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District does not have Planning and Development responsibilities. The District will be updating its Emergency Response Plan in 2021 after completing the risk and resilience assessment.		

Source: NTPUD

As indicated above, the District has several programs, plans, policies, and codes and ordinances that guide hazard mitigation. Some of these are described in more detail below.

5-Year CIP: The District has a rolling 5-Year CIP plan for sewer and water capital projects that is updated annually. The District has a rate structure in place to be able to do \$1,485,000 in sewer capital replacement projects and \$1,430,000 in water capital replacement projects each year.

Sanitary Sewer Management Plan (SSMP): As a requirement of the District’s State Water Resources Control Board Waste Discharge Permit, the Board has adopted an SSMP. The plan sets the goals to maintain the District’s sewer collection system.

The goals are to:

- Properly manage, operate, and maintain all parts of the wastewater collection system
- Provide adequate capacity to convey peak flows
- Minimize the frequency of SSOs
- Mitigate impacts of SSOs
- Justify appropriate funding levels to support the program objectives
- Meet all applicable regulatory notification and reporting requirements

Urban Water Management Plan (UWMP): The State of California Urban Water Management Planning Act (Act) requires each urban water supplier with 3,000 or more connections, or which supplies at least 3,000 acre-feet per year (AFY) of water, to submit UWMPs to the California Department of Water Resources (DWR) every five years. The District has approximately 3,948 water connections.

The UWMP Act requires urban suppliers to report, describe, and evaluate water deliveries and uses, water supply sources, efficient water uses, and demand management measures (DMMs), including implementation schedule and strategy. The purpose of developing an UWMP is to evaluate whether a water supplier can meet the water demands of its water customers as projected over a 20- or 25-year period. The UWMP Act directs water agencies in carrying out their long-term resource planning responsibilities to ensure adequate water supplies are available to meet existing and future demands. This evaluation is accomplished through analysis of current and projected water supply and demand for normal or average conditions, as well as during water shortages.

N.6.2. Administrative/Technical Mitigation Capabilities

Table N-12 identifies the District department(s) responsible for activities related to mitigation and loss prevention in NTPUD.

Table N-12 NTPUD’s Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N/A	County
Mitigation Planning Committee	N/A	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	N/A	Operations Department
Mutual aid agreements	Yes	Mutual Aid agreement in place for Truckee-Tahoe area sewer and water agencies.
Other	N/A	

Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	N/A	
Floodplain Administrator	N/A	
Emergency Manager	N/A	
Community Planner	N/A	
Civil Engineer	Yes	Staffing is adequate; trained on sewer/water emergencies; coordination is effective.
GIS Coordinator	Yes	n/a
Other	N/A	
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	No	
Hazard data and information	No	
Grant writing	Yes	We have limited staff and time to write grants; but take advantage of grant opportunities as they arise.
Hazus analysis	No	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Increase staffing will give us the ability to improve in areas that pertain to NTPUD but are lacking.		

Source: NTPUD

N.6.3. Fiscal Mitigation Capabilities

Table N-13 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table N-13 NTPUD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Yes	Limited funding; adopted new rate structure in 2020 to increase Capital project funding; grants help with being able to do more Capital projects.
Authority to levy taxes for specific purposes	Yes	Limited capability; mostly for sewer and recreation.
Fees for water, sewer, gas, or electric services	Yes	Water and sewer fees are currently used for Capital improvements as funding allows.
Impact fees for new development	N/A	
Storm water utility fee	N/A	

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Incur debt through general obligation bonds and/or special tax bonds	Yes	We have incurred debt in the past with bonds and loans for Capital projects.
Incur debt through private activities	N/A	
Community Development Block Grant	N/A	
Other federal funding programs	Yes	Have received funds through the Lake Tahoe Restoration Act for fire protection. Funds have been limited in recent years.
State funding programs	Yes	Have received funds for various recreation projects. Funds are limited for mitigation actions.
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District's rate setting process is designed to fully fund the utility over a multi-year planning horizon.		

Source: NTPUD

N.6.4. Mitigation Education, Outreach, and Partnerships

Table N-14 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table N-14 NTPUD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N/A	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Yes	We have on-going public education and outreach programs in place for water conservation.
Natural disaster or safety related school programs	N/A	
StormReady certification	N/A	
Firewise Communities certification	N/A	
Public-private partnership initiatives addressing disaster-related issues	N/A	
Other		
How can these capabilities be expanded and improved to reduce risk?		
NTPUD does not provide hazard communications as a special District function.		

Source: NTPUD

N.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

- Fuels reduction in the North Tahoe Regional Park
- Constructed a 500,000 gallon water storage tank
- Constructed a 1.3 million gallon water storage tank
- Upsized the Carnelian Bay West water system from 2” water mains to 8” water mains and installed numerous hydrants for fire protection
- Rehabilitated 4 of the 4 main sewer pump stations
- Rehabilitated the 22” Dollar sewer force main for redundancy and to allow for maintenance of the 16” Dollar sewer force main
- Rehabilitated 3 water storage tanks
- Rehabilitated the Carnelian Sewer Pump Station and installed a new natural gas generator.
- Ongoing upsizing of small diameter water mains (2” or less) to 8” water mains and installation of numerous hydrants for fire protection in the Kings Beach grid neighborhood
- Rehabilitated approximately 7,000 linear feet of sewer main using trenchless methods (Cured in Place Pipe lining)
- Installed an emergency stand-by generator at the NTPUD Base Facilities, connecting the Administration, Shop, servers and communication, Annex buildings and fuel pumps to the generator through automatic transfer switches.
- Installed a new natural gas generator for the National Avenue Water Treatment Facility.
- Upgraded the District’s SCADA and telemetry systems.

N.7 Mitigation Strategy

N.7.1. Mitigation Goals and Objectives

The NTPUD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

N.7.2. Mitigation Actions

The planning team for the NTPUD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Drought & Water Shortage
- Earthquake
- Floods: 1%/0.2% annual chance
- Floods: Localized Stormwater
- Pandemic
- Seiche
- Severe Weather: Extreme Heat
- Severe Weather: Freeze and Snow
- Tree Mortality

➤ Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Backup Generator Installation at Critical Facilities

Hazards Addressed: Multi-hazard (Drought & Water Shortage, Earthquake, Floods: 1%/0.2% annual chance, Floods: Localized Stormwater, Pandemic, Seiche, Severe Weather: Extreme Heat, Severe Weather: Freeze and Snow, Tree Mortality, Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: During power outages for various hazards, the NTPUD does not have backup generators for all critical water, sewer and evacuation center facilities. The critical facilities include:

- North Tahoe Event Center – This facility is a designated Emergency Shelter and Evacuation Center. There is no generator for this facility.
- Various Satellite Sewer and Water Booster Pump Stations

Project Description: Project includes electrical and civil design, permitting, and construction of backup generators and transfers switches.

Other Alternatives: No Project – There will be an impact to water and sewer service and facilities during power outages. The emergency evacuation center will not be fully functional during a power outage.

Existing Planning Mechanism(s) through which Action Will Be Implemented: NTPUD either has or will soon have the generators sized. Implementation would be within 6 months of grant approval.

Responsible Agency/ Department/Partners: NTPUD Engineering

Cost Estimate: \$200,000 per generator

Benefits (Losses Avoided):

- Emergency power to serve the community

- Avoid sanitary sewer overflow into Lake Tahoe
- Ensure potable water service

Potential Funding: Rate Revenue, ARB funds

Timeline: 1-3 Years

Project Priority (H, M, L): Medium/High

Action 2. Fuels Reduction around Critical Infrastructure and Access Roads, and within the North Tahoe Regional Park

Hazards Addressed: Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: NTPUD's water tanks, booster pump stations, and access roads are in heavily forested areas. Several of the water booster pump stations are in wooden structures. Hardened structures would reduce threat from wildfire and reduce impacts to the equipment.

The North Tahoe Regional Park (NTRP) is heavily wooded and NTPUD has a water well and tank within the NTRP.

Project Description: Identify hazards, design, permitting, and construction (vegetation and tree removal).

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Agency/ Department/Partners: NTPUD; North Tahoe Fire Protection District

Cost Estimate: \$75,000 per year

Benefits (Losses Avoided): Minimize damage due to catastrophic wildfire

Potential Funding: None identified

Timeline: 5-10 Years

Project Priority (H, M, L): Medium

Action 3. Increased Fireflow Capacity and Reliability for Dollar Cove and Carnelian Water Systems

Hazards Addressed: Wildfire; Drought; Water Supply

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The Dollar Cove and Carnelian water systems are located at the wildland urban interface and each system has approximately 300 residential and commercial customers. The two water systems are comprised of watermains ranging from 2 inches to 8 inches in diameter. The system is deficient in fire flows and in the number and spacing of fire hydrants and does not meet current fire codes

Project Description: This project proposes to rebuild approximately 10,000 lineal feet of water mains and install 20 fire hydrants in the two water systems..

Other Alternatives: No Project Continue to operate a water system that is deficient in supplying adequate fire flows.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Water system hydraulic modeling of watermains and hydrants has been completed for proposed project alternatives

Responsible Agency/ Department/Partners: NTPUD Engineering

Cost Estimate: \$4,000,000

Benefits (Losses Avoided):

- Ensure sufficient water supply for fire suppression. Adds additional protection at the wildland urban interface to reduce the probability of structure fires entering the wildland and wildland fires from entering the developed areas.

Potential Funding: Rate Revenue, State Revolving Fund, Placer County Water Agency

Timeline: 5-10 Years

Project Priority (H, M, L): High

Action 4. Cybersecurity Assessment and Improvements

Hazards Addressed: Multi-hazard (Drought & Water Shortage, Earthquake, Floods: 1%/0.2% annual chance, Floods: Localized Stormwater, Pandemic, Seiche, Severe Weather: Extreme Heat, Severe Weather: Freeze and Snow, Tree Mortality, Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: NTPUD’s existing Information Technology (IT) and Operational Technology (OT) need continuous improvements to stay abreast of increasing sophisticated cybersecurity threats and attacks from bad actors. Ransomware and computer viruses can cause widespread disruption in utility control systems.

Project Description: Analysis of IT and OT through master planning and assessments through the Department of Homeland Security and the American Water Works association Cybersecurity Guidance Tool.

Other Alternatives: None.

Existing Planning Mechanism(s) through which Action Will Be Implemented: American Water Works Association supports water agencies to assess cybersecurity risk.

Responsible Agency/ Department/Partners: NTPUD IT and Public Information Officer in coordination with other agencies in the Tahoe-Truckee region.

Cost Estimate: \$250,000

Benefits (Losses Avoided):

- Insure timely and appropriate response to emergencies
- Ensure water and sewer system controls are hardened for reliability
- Insure IT and OT are resilient to malevolent attacks

Potential Funding: Rate Revenue

Timeline: 3-5 Years and on-going

Project Priority (H, M, L): Medium

Action 5. Seismic Analysis and Retrofit of Critical Infrastructure

Hazards Addressed: Earthquake

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Conduct a seismic evaluation of NTPUD's critical infrastructure and recommend improvements. Existing structures have been constructed and renovated to improve structural soundness during improvements project. This project would do a site specific analysis to improve reliability of facilities.

Project Description: Project includes seismic analysis of critical facilities, design, permitting, and construction.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None identified

Responsible Agency/ Department/Partners: NTPUD Engineering

Cost Estimate:

- \$100,000 for the study
- \$100,000 for each water tank retrofit
- \$100,000 for each main sewer pump station
- Unknown cost estimate for other unidentified facilities

Benefits (Losses Avoided):

- Prevent essential water service loss to community
- Prevent sanitary sewer overflows to Lake Tahoe due to infrastructure failure

Potential Funding: Rate Revenue

Timeline: 5-10 Years

Project Priority (H, M, L): Medium

Action 6. Sewer Main Replacements in Shorezone of Lake Tahoe

Hazards Addressed: Earthquake; Flood, Localized Flood, Heavy Rains and Storms, Seiche

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The NTPUD has approximately 5 miles of sewer mains that are within or immediately adjacent to the shore zone of Lake Tahoe. The NTPUD also has two main sewer pump stations and a number of small, satellite pump stations adjacent to the shore zone of Lake Tahoe. The long-term goal of the Lake Tahoe Basin Framework Study would be to relocate these facilities to the further in-shore where the risk of sanitary sewer overflows reaching Lake Tahoe would be better controlled. Other measures include providing underground passive storage to increase time for emergency response and installation of redundant critical pipelines.

Project Description: Project includes property acquisition, design, permitting, and construction of new sewer mains and underground storage structures in the public right of way, relocation and reconnection of existing services, and abandonment of facilities.

Other Alternatives: No Project.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Lake Tahoe Basin Framework Study completed by the US Army Corps of Engineers

Responsible Agency/ Department/Partners: NTPUD Engineering

Cost Estimate: \$20,000,000

Benefits (Losses Avoided): Minimize sanitary sewer overflows to Lake Tahoe due to infrastructure failure that also impacts Lake Tahoe water quality which is the drinking water source for multiple public water systems located at Lake Tahoe

Potential Funding: None identified

Timeline: 20 Years

Project Priority (H, M, L): Low

Action 7. Water Booster Pump Station Rehabilitation/Replacement

Hazards Addressed: Wildfire, Tree Mortality, Drought and Water Shortage, High Winds and Tornadoes

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: NTPUD's water tanks, booster pump stations, and access roads are in heavily forested areas. Several of the water booster pump stations are in wooden structures. Hardened structures would reduce threat from wildfire and reduce impacts to the equipment.

Project Description: This project would include design, permitting, and construction to rehabilitate the existing wooden structures using fire resistant materials or replacing the wooden structures with either underground booster stations or concrete buildings.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Agency/ Department/Partners: NTPUD Engineering

Cost Estimate: \$250,000 per station

Benefits (Losses Avoided): Improve potable water service resiliency by improving fire protection of the existing facility.

Potential Funding: None identified

Timeline: 5-10 Years

Project Priority (H, M, L): Medium

Action 8. Water System Interties

Hazards Addressed: Drought; Water Supply

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The existing water system interties between the public and private water systems is insufficient to provide adequate, reliable potable water supplies in the event of impacts to water sources and water reservoirs.

Project Description: This project would either install intertie connections between water systems, or install larger diameter water mains (12-14 inches) in the State highway, or a combination of the two. Scope includes analysis, design, permitting, and construction of the selected approach.

Other Alternatives: No Project Continue to operate multiple water systems that are deficient in supplying adequate fire flows.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Placer County Water Agency Northwest Lake Tahoe Area Water System Master Plan Project. .

Responsible Agency/ Department/Partners: NTPUD, TCPUD, North Tahoe Fire District, PCWA, various private water companies.

Cost Estimate: \$5 - \$40 million, depending on approach

Benefits (Losses Avoided):

- Insure sufficient potable water supply during severe droughts .
- Insure sufficient water supply and flow for fire suppression.

Potential Funding: Rate Revenue; Placer County Water Agency

Timeline: 5-20 Years

Project Priority (H, M, L): High

Action 9. Joint Grant Application with North Tahoe Public Utilities District (NTPUD) for an Emergency Back-up Generator System at the North Tahoe Event Center (NTEC) located at 8318 North Lake Blvd, Kings Beach, CA 96143.

Hazards Addressed: Multi-hazard (Drought & Water Shortage, Earthquake, Floods: 1%/0.2% annual chance, Floods: Localized Stormwater, Pandemic, Seiche, Severe Weather: Extreme Heat, Severe Weather: Freeze and Snow, Tree Mortality, Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: During power outages, the NTPUD does not have back-up emergency power at the North Tahoe Event Center. This facility is designated by Placer County Office of Emergency Services as an Emergency Shelter and Evacuation Center for the residents and visitors of the North Shore of Lake Tahoe, as well as during Mutual Aid shelter and evacuation operations for the Truckee and Lake Tahoe basin. There is currently no back-up generator or provisions for emergency power at this facility. The addition of a generator would allow for expanded shelter operations including 24-hour operations, heating, air conditioning, and providing hot meals for evacuees. No other building in the region provides the flexibility for reconfiguration to accommodate shelter, food preparation, and services to local residents during a planned power outage or declared emergency.

Project Description: The integration of power disruption mitigation measures into this planned infrastructure project will provide tangible benefits to the community and its public works staff. This generator project will reduce Emergency Shelter and Evacuation Shelter downtime resulting from power failure by reducing the risks associated with planned and unplanned events. Without an Emergency Generator and appurtenances, the North Tahoe Event Center cannot operate as an Emergency Shelter or Evacuation Center during power outages, leaving the North Tahoe community at risk of traveling longer distances to an alternative shelter that has power, potentially causing over-crowded road and shelter

conditions and loss of life. Mitigation is most effective when it is part of the local community planning process and resilience by adapting to changing conditions and prepare for, withstand, and rapidly recover from disruption. This plan will allow for local jurisdictions to adapt, cooperate, and recover from multiple hazards. This project includes the installation of a complete UL 2200 listed, prototype tested, series produced 130kW Natural Gas generator set in a Level 2 acoustic locking weather enclosure, on site, as installed (no altitude derating) with engineered seismically-adequate reinforced concrete support pad and all conduit and wiring, with on-site load bank testing and startup services by vendor. It will provide all standard accessories including battery charger, Automatic Transfer Switch, block heater, battery charger, battery warming pads, protective traffic bollards. Approximate dimensions for generator is 12' L x 3' 6" W x 6' 6" H. There is adequate, paved areas that will be used for construction staging and parking. Water use will not be necessary as part of this project.

Other Alternatives: Trailer Mount Portable Generator System, Battery Back-up System

Existing Planning Mechanism(s) through which Action Will Be Implemented: North Tahoe PUD is preparing a joint agency grant application for submittal to the California Office of Emergency Services ("CalOES") for funding through the Hazard Mitigation Grant Program ("HMGP") for the acquisition and installation of a permanent Generator at the North Tahoe Event Center.

Responsible Agency/ Department/Partners: North Tahoe Public Utility District and Placer County

Cost Estimate: \$300,000

Benefits (Losses Avoided): Expanded shelter operations including 24-hour operations, heating, air conditioning, and providing hot meals for evacuees.

Potential Funding: Hazard Mitigation Grant Program

Timeline: Fiscal year FY2021/22

Project Priority (H, M, L): High

Action 10. Kings Beach Grid Watermain Replacement and Fire Hydrant Installation Project

Hazards Addressed: Wildfire; Drought; Water Supply

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The Kings Beach grid water system was constructed in the early 1930's and the existing water distribution pipelines range in size from one (1) to twelve (12) inches in diameter and are routed in inaccessible backyards and in public rights of ways. The system is deficient in fire flows and in the number and spacing of fire hydrants and does not meet current fire codes.

Project Description: This project proposes to rebuild approximately 15,000 lineal feet of water mains and install 30 fire hydrants and all new water services and meters to the properties served.

Other Alternatives: No Project - Continue to operate a water system that is deficient in supplying adequate fire flows.

Existing Planning Mechanism(s) through which Action Will Be Implemented: The Kings beach Grid Waterline Replacement Project Preliminary Design Report is complete.

Responsible Agency/ Department/Partners: NTPUD

Cost Estimate: \$7,500,000

Benefits (Losses Avoided): Ensure sufficient water supply for fire suppression. Adds additional protection at the wildland urban interface to reduce the probability of structure fires entering the wildland and wildland fires from entering the developed areas.

Potential Funding: Rate Revenue, State Revolving Fund, Placer County Water Agency

Timeline: 5 years

Project Priority (H, M, L): H

Action 11. NTPUD Water System Infill and Fire Suppression Improvements Project

Hazards Addressed: Wildfire; Drought; Water Supply

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: In the NTPUD service area there are numerous areas that were constructed as early as the 1930's and the existing water distribution pipelines range in size from one (1) to twelve (12) inches in diameter and are routed in inaccessible backyards and in public rights of ways. The system is deficient in fire flows and in the number and spacing of fire hydrants and does not meet current fire codes. Portions of these pipelines have been replaced but there are still non-contiguous segments of one (1) to four (4) inch diameter pipelines in various locations.

Project Description: This project proposes to rebuild approximately 5,000 lineal feet of water mains and install 12 fire hydrants and all new water services and meters to the properties served.

Other Alternatives: No Project - Continue to operate a water system that is deficient in supplying adequate fire flows.

Existing Planning Mechanism(s) through which Action Will Be Implemented: NTPUD Water System Infill and Fire Suppression Improvements Project assets are identified in the District's GIS and asset management system

Responsible Agency/ Department/Partners: NTPUD

Cost Estimate: \$2,500,000

Benefits (Losses Avoided): Ensure sufficient water supply for fire suppression. Adds additional protection at the wildland urban interface to reduce the probability of structure fires entering the wildland and wildland fires from entering the developed areas.

Potential Funding: Rate Revenue, State Revolving Fund, Placer County Water Agency

Timeline: 10 years

Project Priority (H, M, L): H

Annex O Olympic Valley Fire Department/Olympic Valley Public Service District

O.1 Introduction

This Annex details the hazard mitigation planning elements specific to Olympic Valley Fire Department/Olympic Valley Public Service District (OVFD/OVPSD or District), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to OVFD/OVPSD, with a focus on providing additional details on the risk assessment and mitigation strategy for the District.

O.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table O-1. Additional details on plan participation and District representatives are included in Appendix A.

Table O-1 OVFD/OVPSD – Planning Team

Name	Position/Title	How Participated
Brandon Burks	Operations Manager	Planning, participant
Allen Riley	Fire Chief	Planning, participant

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the District integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the District incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table O-2.

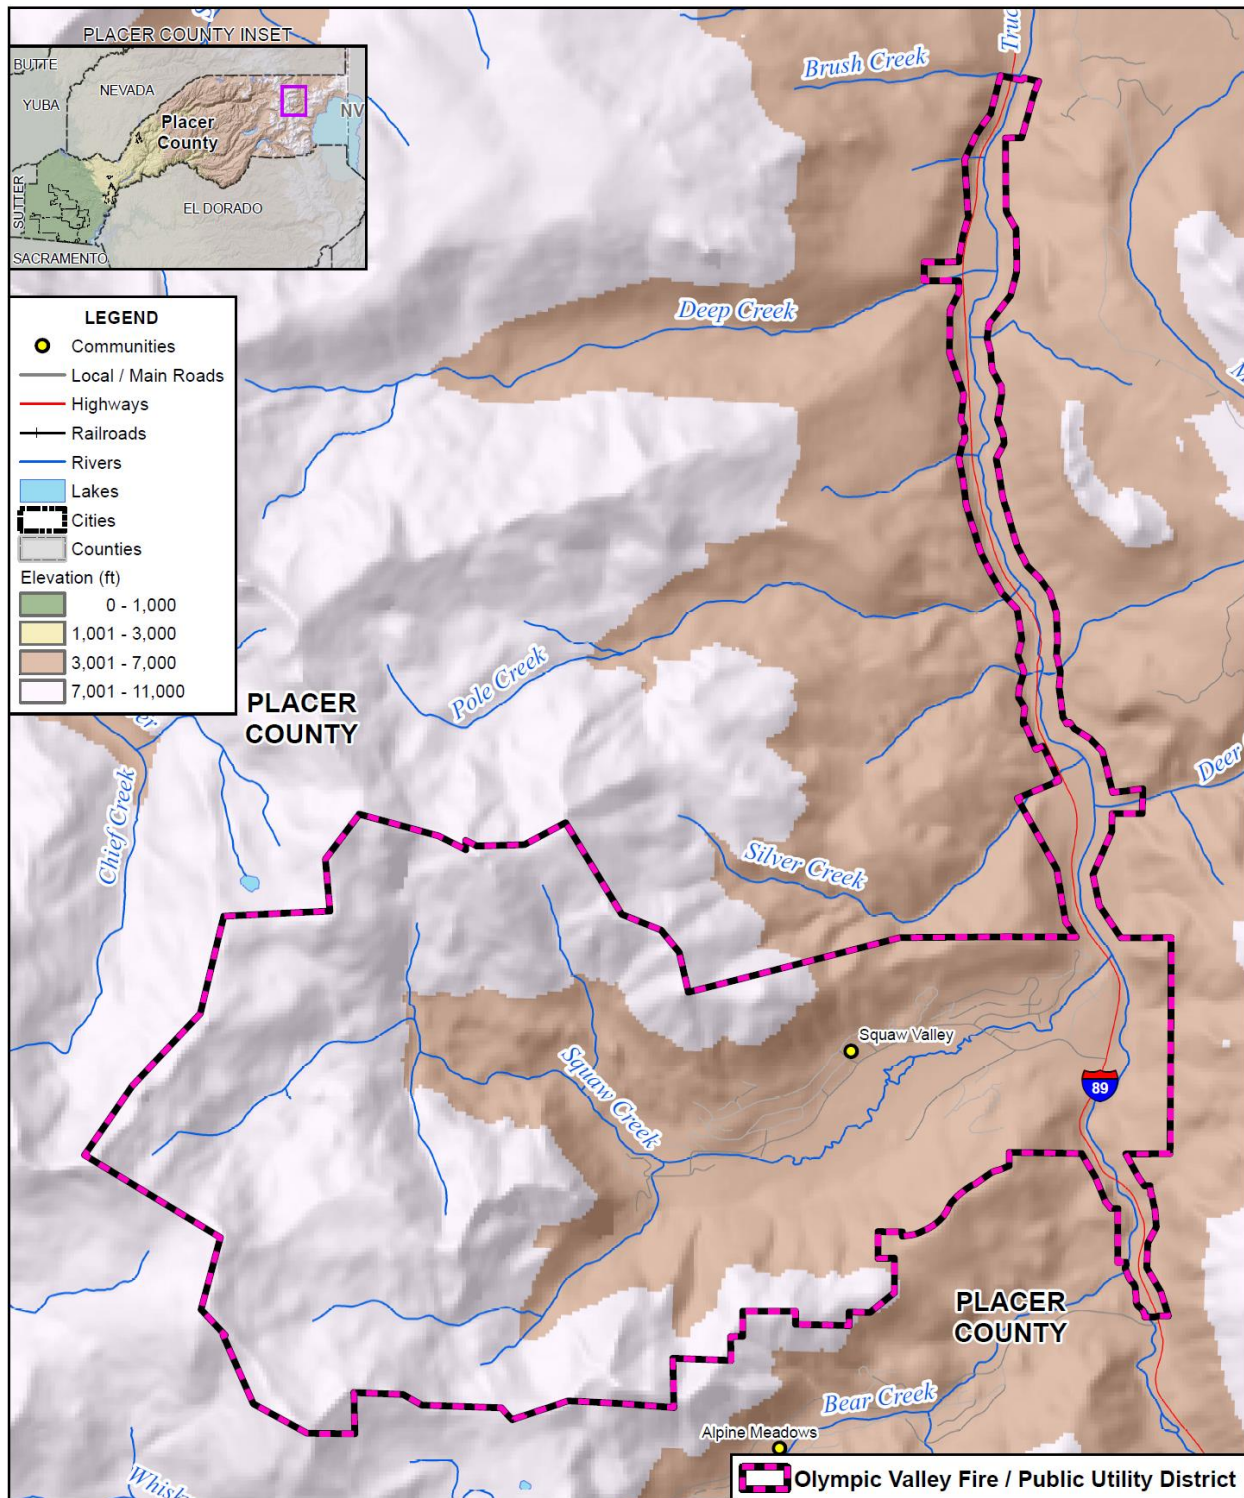

Table O-2 2016 LHMP Incorporation

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
N/A	No mitigation planning mechanisms have been completed since 2016.

O.3 District Profile

The District profile for the OVFD/OVPSD is detailed in the following sections. Figure O-1 displays a map and the location of the District within Placer County.

Figure O-1 OVFD/OVPSD

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

O.3.1. Overview and Background

The Olympic Valley Public Services District (OVPSD) serves the community of Olympic Valley in providing water, maintaining sewer Lines, contracting garbage service, and providing fire protection services to the community. The OVPSD encompasses approximately 5,350 acres within the Olympic Valley. Elevations within the District boundaries range from 6,100 to 9,000 feet above mean sea level.

The OVPSD serves a population of approximately 924 year-round residents, with a maximum overnight population of approximately 6,573. Both resident and visiting populations are housed in approximately 663 residential unit, 1,180 condominiums, and approximately 20 commercial entities consisting of private residences, ski resorts, hotels and supporting businesses.

The Olympic Valley is characterized by mild summers and cool, wet winters, with an average high temperature in July of 82 and 42 in January. Annual precipitation in the watershed varies from an average of 65 inches in the west to approximately 40 inches per year in the east. The majority of precipitation occurs as snowfall during the winter months. A relatively small amount of precipitation occurs as rain during the spring and summer months.

O.4 Hazard Identification

OVFD/OVPSD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table O-3).

Table O-3 OVFD/OVPSD —Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Limited	Unlikely	Negligible	Low	Medium
Avalanche	Significant	Likely	Limited	Medium	Medium
Climate Change	–	–	–	–	–
Dam Failure	Limited	Unlikely	Limited	Medium	Medium
Drought & Water Shortage	Significant	Occasional	Negligible	Low	High
Earthquake	Limited	Occasional	Critical	Medium	Low
Floods: 1%/0.2% annual chance	Limited	Occasional	Limited	High	Medium
Floods: Localized Stormwater	Limited	Likely	Limited	Medium	Medium
Landslides, Mudslides, and Debris Flows	Limited	Occasional	Limited	Medium	Medium
Levee Failure	Limited	Unlikely	Negligible	Low	Medium
Pandemic	–	–	–	–	Medium
Seiche	Limited	Unlikely	Negligible	Low	Medium
Severe Weather: Extreme Heat	Limited	Occasional	Negligible	Low	High
Severe Weather: Freeze and Snow	Significant	Highly Likely	Limited	Medium	Medium
Severe Weather: Heavy Rains and Storms	Significant	Highly Likely	Limited	Medium	Medium
Severe Weather: High Winds and Tornadoes	–	–	–	–	Low
Tree Mortality	Extensive	Likely	Critical	High	High
Wildfire	Extensive	Highly Likely	Critical	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

O.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District's hazards and assess the District's vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

O.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section O.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table O-3) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

O.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District's total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the OVFD/OVPSD's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table O-4 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. OVFD/OVPSD’s physical assets, valued at over \$450 million, consist of the buildings and infrastructure to support the District’s operations.

Table O-4 OVFD/OVPSD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Hazard Info
Squaw Ridge Booster and Vault	Essential	\$325,000	Earthquake, wildfire
Fire Station & Administrative Center	Essential	\$12.5 million	Earthquake, Landslide, Wildfire
Headquarters & Utility/Fire Station	Essential	\$7.5 million	Flood, Earthquake, Landslide
Pumphouse and Generator	Essential	\$1.6 million	Earthquake, flood
Utility Garage and Generator	Essential	\$575,000	Earthquake, landslide, Wildfire
SCADA System	Essential	\$210,000	Extreme Weather
Water Tank #1	Lifeline	\$1,100,000	Earthquake, Landslide
Water Tank #2	Lifeline	\$700,000	Earthquake, Landslide
Water Tank #3	Lifeline	\$300,000	Earthquake, Landslide
Convault Tank	Lifeline	\$40,000	Wildfire
Main Well #5	Lifeline	\$1.5 million	Earthquake, Flood
Well #2	Lifeline	\$250,000	Earthquake, Flood
Well #3	Lifeline	\$250,000	Earthquake, Flood
Well #1	Lifeline	\$250,000	Earthquake, Flood
Squaw Valley USA Resort	High Potential Loss	\$200 million	Wildfire, Avalanche, Earthquake, Landslide
Resort at Squaw Creek	High Potential Loss	\$80 million	Wildfire, Landslide, Earthquake
State Route 89	Transportation	Unknown	Avalanche, Landslide, Flood
Midway Bridge	Transportation	Unknown	Earthquake, Flood
SVPSD Water Distribution System	Lifeline	\$25 million	Earthquake, Flood, Landslide
OVPSD Sewer Collection System	Lifeline	\$25 million	Earthquake, Flood, Landslide

Name of Asset	Facility Type	Replacement Value	Hazard Info
Squaw Valley Mutual Water Company	Lifeline	\$10 million	Earthquake, Flood, Landslide

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. OVFD/OVPSD provides services to a population of 1,366.

Natural Resources

OVFD/OVPSD has a variety of natural resources of value to the District. Several state or federally listed species may be found within the District boundary. These are identified, along with other species of concern found in the District, in Table O-5.

Table O-5 Species of Concern in OVFD/OVPSD

Common Name	Scientific Name	CNPS3 Listing Federal Status	State Status
Carson Range rock cress	<i>Arabis rigidissima var. demote</i>	1B	
Oregon fireweed	<i>Epilobium oregonum</i>	1B	
Starved daisy	<i>Erigeron miser</i>	1B	
Nevada daisy	<i>Erigeron nevadincola</i>	2	
Donner Pass buckwheat	<i>Eriogonum umbellatum var. torreyanum</i>	1B	
American manna grass	<i>Glyceria grandis</i>	2	
Plumas ivesia	<i>Ivesia sericoleuca</i>	1B	
Long-petaled lewisia	<i>Lewisia longipetala</i>	1B	
Slender-leaved pondweed	<i>Potamogeton filiformis</i>	2	
Tahoe yellow cress	<i>Rorippa subumbellata</i>	1B	
Marsh skullcap	<i>Scutellaria galericulata</i>	2	
Munroe's desert mallow	<i>Sphaeralcea munroana</i>	2	
Fish, Amphibians, Birds			
Lahontan cutthroat trout	<i>Oncorhynchus clarkia benshawi</i>	FT	
Mountain yellow-legged frog	<i>Rana muscosa</i>	FE	CSC
Harlequin duck	<i>Histrionicus</i>	MNBMC	CSC
Cooper's hawk	<i>Accipiter cooperi</i>	MNBMC	CSC
Northern goshawk	<i>Accipiter gentiles</i>		CSC
Bald eagle	<i>Haliaeetus leucocephalus</i>	FT; FPD; MNBMC	SE; CFP
Osprey	<i>Pandion haliaetus</i>		CSC
Yellow warbler	<i>Dendroica petechia brewsteri</i>	MNBMC	CSC

Common Name	Scientific Name	CNPS3 Listing Federal Status	State Status
Willow flycatcher	<i>Empidonax trailii</i>	MNBMC	SE
Sierra Nevada mountain beaver	<i>Aplodontia rufa californica</i>		CSC
California wolverine	<i>Gulo</i>		ST
Sierra Nevada snowshoe hare	<i>Lepus americanus taboensis</i>		CSC
Western white-tailed jackrabbit	<i>Lepus townsendi</i>		CSC
American pine marten	<i>Martes Americana</i>		
Sierra marten	<i>Martes Americana sierrae</i>		
Pacific fisher	<i>Martes pennanti (pacific) DPS</i>	FC	CSC
Long-legged myotis	<i>Myotis Volans</i>		
Sierra Nevada red fox	<i>Vulpes necator</i>		ST

Source: OVFD/OVPSD

Sensitive habitats in the District include the following:

- Lodgepole pine forest
- Red fir forest
- Montane chaparral
- Montane riparian
- Wet meadows
- Ponds
- Riverine/riparian

Historic and Cultural Resources

OVFD/OVPSD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Tahoe Area of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Squaw Valley has few residents that fit the category of special populations. The Village project identified below will seek an employee housing project; presently low income workers live mostly outside Squaw Valley.

Growth and Development Trends

Significant development is contemplated with expansion of the village at Squaw Valley; information may be obtained at Placer County under the Village at Squaw Valley Specific Plan. Additional projects on the near horizon include:

- PlumpJack Squaw Valley Inn: a plan to raze and rebuild an existing 61 unit hotel into a 60 unit hotel plus 34 condos. The project will include an underground parking garage that may be impacted by flooding on Squaw Peak Road.
- The Resort at Squaw Creek Phase II: A fully entitled project that would add a second tower and 18 Lakeside condos totaling 221 units, a parking garage and employee housing.

Projects in Planning include:

- The Palisades: Approximately 65 single family planned unit development currently being built.
- Carville Property Hotel and Residential Project- a boutique hotel and several homes

None of these projects pose a significant impact to existing hazards

Unique to this part of Placer County is not the growth of full time residents, but the influx of visitors and tourists to the area, especially during the peak summer and winter seasons. While this area is home to only about 924 full time residents, during high season, some 6,500 people, on any given day, may be enjoying the recreational and tourist opportunities. This spike in population creates a unique vulnerability to the area, especially in the event highways become impassable due to flooding, landslides, avalanches or gridlocks due to high volume and extreme weather conditions. Even during the off-season, the lack of multiple transportation routes, if closed, can leave the resident population cut off from necessary and potentially life-saving services.

It is important to note that given the high cost of housing due to the resort nature of the area, much of the work force resides outside of Squaw Valley. With limited access roads to the area, the work force may be isolated when most needed for disaster response.

Development since 2016

The District replaced its existing sewer siphon line under the Truckee River with a new dual siphon. Reducing the hazard of spilling sewage during flood events or other

Future Development

The District has no control over future development in areas the District services. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

O.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table O-3 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Avalanche

Likelihood of Future Occurrence—Likely

Vulnerability—Medium

Hazard Profile and Problem Description

According to the Sierra Avalanche Center, avalanches occur when loading of new snow increases stress at a rate faster than strength develops, and the slope fails. Avalanches are a rapid down-slope movement of snow, ice and debris triggered by ground shaking, sound, or human or animal movement. Avalanches consist of a starting zone where the ice or snow breaks loose, a track which is the grade or channel the debris slides down and a run-out zone where the snow is deposited.

Critical stresses develop more quickly on steeper slopes and where deposition of wind-transported snow is common. The vast majority of avalanches occur during and shortly after storms. This hazard generally affects a small number of people, such as snowboarders, skiers, and hikers who venture into backcountry areas during or after winter storms. Roads and highway closures, damaged structures, and destruction of forests are also a direct result of avalanches.

Location and Extent

The two primary factors impacting avalanche activity are weather and terrain. Large, frequent storms deposit snow on steep slopes to create avalanche hazards. Additional factors that contribute to slope stability are the amount of snow, rate of accumulation, moisture content, wind speed and direction and type of snow crystals. Topography also plays a vital role in avalanche dynamics. Slope angles between 30 to 45 degrees are optimal for avalanches. The risk of avalanches decreases on slope angles below 30 degrees. At 50 or more degrees they tend to produce sluff or loose snow avalanches that account for only a small percentage of avalanche deaths and property damage annually.

Areas prone to avalanche hazards include hard to access areas deep in the backcountry and those in the more developed higher elevations of the County in the Tahoe basin. Avalanche hazards exist in eastern Placer County where the District is located where combinations of the above criteria occur.

Past Occurrences

There have been no state or federal disasters in the County related to avalanche. In 2001 during a winter storm generating 20 inches of fresh snow, a Class II avalanche occurred resulting in two fatalities. Other avalanches occur throughout each winter ski season, with most of these confined to out-of-bounds areas where damages are limited.

Residential areas subject to avalanche are located along Sandy Way at the base of steep slopes, most significantly in the area known as “the slide” above the 1200 block. The Shirley Lake Condominiums on Squaw Peak Way have been hit by small avalanches on several occasions. The Olympic Valley Fire Department may evacuate these areas during periods of known and extreme avalanche danger.

Vulnerability to and Impacts from Avalanche

Avalanches occur when the weight of new snow increases stress faster than strength of the snowpack develops, causing the slope to fail. Avalanche conditions develop more quickly on steeper slopes (located in the eastern portions of the County) and where wind-blown snow is common. Avalanche impacts vary, but include risk to property, injury, or death. Avalanches generally affect a few snowboarders, skiers, and hikers who venture into backcountry areas during or after winter storms. Avalanches cause road closures, and can damage structures and forests and has potential to bury pipeline facilities in streets or easements

Ski resorts, due to their steep slopes, abundant snow, snowpack, and the presence of people moving throughout the area, are prone to avalanches. Placer County identifies the Olympic Valley area as vulnerable to avalanche activity.

Assets at Risk

All of those identified in Table O-4 with avalanche in the righthand column.

Dam Failure

Likelihood of Future Occurrence–Unlikely

Vulnerability–Medium

Hazard Profile and Problem Description

Dams are manmade structures built for a variety of uses including flood protection, power generation, agriculture, water supply, and recreation. When dams are constructed for flood protection, they are usually engineered to withstand a flood with a computed risk of occurrence. For example, a dam may be designed to contain a flood at a location on a stream that has a certain probability of occurring in any one year. If prolonged periods of rainfall and flooding occur that exceed the design requirements, that structure may be overtopped or fail. Overtopping is the primary cause of earthen dam failure in the United States.

Location and Extent

Dam failure is a natural disaster from two perspectives. First, the inundation from released waters resulting from dam failure is related to naturally occurring floodwaters. Second, a total dam failure would most probably happen as a consequence of the natural disaster triggering the event, such as an earthquake. There is no scale with which to measure dam failure. However, Cal DWR Division of Safety of Dams (DOSD) assigns hazard ratings to dams within the State that provides information on the potential impact should a dam fail. The following two factors are considered when assigning hazard ratings: existing land use and land use controls (zoning) downstream of the dam. Dams are classified in four categories that identify the potential hazard to life and property: Low, Significant, High, and Extremely High. These were discussed in more detail in Section 4.3.9 of the Base Plan.

While a dam may fill slowly with runoff from winter storms, a dam break has a very quick speed of onset. The duration of dam failure is generally not long – only as long as it takes to empty the reservoir of water the dam held back. The District would be affected for as long as the flood waters from the dam failure took to drain downstream.

The District also noted that, while inundation data was not available, the following dams are also a concern to the District. There are 7 surface water impoundments in Olympic Valley of about an acre or less in surface area contained behind small earthen or concrete dams. They are Hidden Lake, Gold Coast Snow Making Pond, Olympic Lady Pond, Shirley Lake, an old water supply reservoir on the South fork of Squaw Creek above the base area of the ski resort, and 2 ponds at the Resort at Squaw Creek golf course. These impoundments are known to overflow during extreme flood events such as the 1997 flood and would contribute a moderate surge of additional water if failure were to occur.

Past Occurrences

There has been no federal or state disaster declarations for dam failure in the County. The District noted no other dam failure occurrences that have affected the District.

Vulnerability to and Impacts from Dam Failure

Dam failure flooding would vary by community depending on which dam fails and the nature and extent of the dam failure and associated flooding. Impacts to the District from a dam failure flood could include loss of life and injury, flooding and damage to property and structures, damage to critical facilities and infrastructure, loss of natural resources, and all other flood related impacts. Additionally, mass evacuations and associated economic losses can also be significant.

Assets at Risk

Flooding and overwhelming of sewer facilities downstream. Potential damage to bridges and access on Highway 89.

Earthquake

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

An earthquake is caused by a sudden slip on a fault. Stresses in the earth's outer layer push the sides of the fault together. Stress builds up, and the rocks slip suddenly, releasing energy in waves that travel through the earth's crust and cause the shaking that is felt during an earthquake. Earthquakes can cause structural damage, injury, and loss of life, as well as damage to infrastructure networks, such as water, power, gas, communication, and transportation. Earthquakes may also cause collateral emergencies including dam and levee failures, seiches, hazmat incidents, fires, avalanches, and landslides. The degree of damage depends on many interrelated factors. Among these are: the magnitude, focal depth, distance from the causative fault, source mechanism, duration of shaking, high rock accelerations, type of surface deposits or bedrock, degree of consolidation of surface deposits, presence of high groundwater, topography, and the design, type, and quality of building construction.

Location and Extent

The amount of energy released during an earthquake is usually expressed as a magnitude and is measured directly from the earthquake as recorded on seismographs. An earthquake's magnitude is expressed in whole numbers and decimals (e.g., 6.8). Seismologists have developed several magnitude scales, as discussed in Section 4.3.11 of the Base Plan. Placer County itself is traversed by a series of northwest-trending faults, called the Foothill Fault Zone, that are related to the Sierra Nevada uplift. This was the source of Oroville's 1975 earthquake (and an earlier event in the 1940s). Subsequent research of these events led to the identification and naming of the zone and questions about the siting and design of the proposed Auburn Dam. Earthquakes on nearby fault segments in the zone could be the source of ground shaking in the Placer County Planning Area.

Although portions of western and eastern Placer County are located in a seismically active region, no known faults actually go through any of the cities or towns. However, the Bear Mountain and the Melones faults are situated approximately three to four miles west and east of the City of Auburn respectively. Earthquakes on these two faults would have the greatest potential for damaging buildings in Auburn, especially the unreinforced masonry structures in the older part of the city and homes built before 1960 without adequate anchorage of framing and foundations. Similar lower magnitude but nearby earthquakes are capable of producing comparable damages in other Placer County communities.

Another measure of earthquake severity is intensity. Intensity is an expression of the amount of shaking at any given location on the ground surface. Seismic shaking is typically the greatest cause of losses to structures during earthquakes. The District is located in an area where some earthquakes of significant magnitude occur. Seismic shaking maps for the area show Placer County and the District fall within a moderate shake risk.

Past Occurrences

There have been no past federal or state disaster declarations from this hazard. The District noted no past occurrences of earthquakes or that affected the District in any meaningful way.

Vulnerability to and Impacts from Earthquake

The combination of plate tectonics and associated California coastal mountain range building geology generates earthquake as a result of the periodic release of tectonic stresses. Placer County lies in the center of the North American and Pacific tectonic plate activity. There have been earthquakes as a result of this activity in the historic past, and there will continue to be earthquakes in the future of the California north coastal mountain region.

Fault ruptures itself contributes very little to damage unless the structure or system element crosses the active fault; however, liquefaction can occur further from the source of the earthquake. In general, newer construction is more earthquake resistant than older construction due to enforcement of improved building codes. Manufactured buildings can be very susceptible to damage because their foundation systems are rarely braced for earthquake motions. Locally generated earthquake motions and associated liquefaction, even from very moderate events, tend to be more damaging to smaller buildings, especially those constructed of unreinforced masonry (URM) and soft story buildings.

The Uniform Building Code (UBC) identifies four seismic zones in the United States. The zones are numbered one through four, with Zone 4 representing the highest level of seismic hazard. The UBC establishes more stringent construction standards for areas within Zones 3 and 4. All of California lies within either Zone 3 or Zone 4. The OVFD/OVPSD is within the less hazardous Zone 3.

Impacts from earthquake in the District will vary depending on the fault that the earthquake occurs on, the depth of the earthquake strike, and the intensity of shaking. Large events could cause damages to infrastructure, critical facilities, residential and commercial properties, and possible injuries or loss of life.

The 2008 Draft Supplemental Environmental Impact Report for Water and Sewer Service Agreement for the resort at Squaw Creek: Phase II, indicates that six north-northwest, trending north-northeast dipping faults are located in the Olympic Valley watershed, four of which cross the valley floor. Of the four faults, only one has documented evidence of recent movement. However, because of the limited development in the area, and lack of un-reinforced masonry buildings, compared to a more urban setting, the OVFD/OVPSD service area would likely be of moderate vulnerability to damage from severe ground shaking.

Assets at Risk

All of those identified in Table O-4 with earthquake in the righthand column.

Flood: 1%/0.2% Annual Chance

Likelihood of Future Occurrence—Occasional/Unlikely

Vulnerability—High

Hazard Profile and Problem Description

This hazard analyzes the FEMA DFIRM 1% and 0.2% annual chance floods. These tend to be the larger floods that can occur in the County or in the District, and have caused damages in the past. Flooding is a significant problem in Placer County and the District. Historically, the District has been at risk to flooding primarily during the winter and spring months when river systems in the County swell with heavy rainfall and snowmelt runoff. Normally, storm floodwaters are kept within defined limits by a variety of storm drainage and flood control measures. Occasionally, extended heavy rains result in floodwaters that exceed normal high-water boundaries and cause damage.

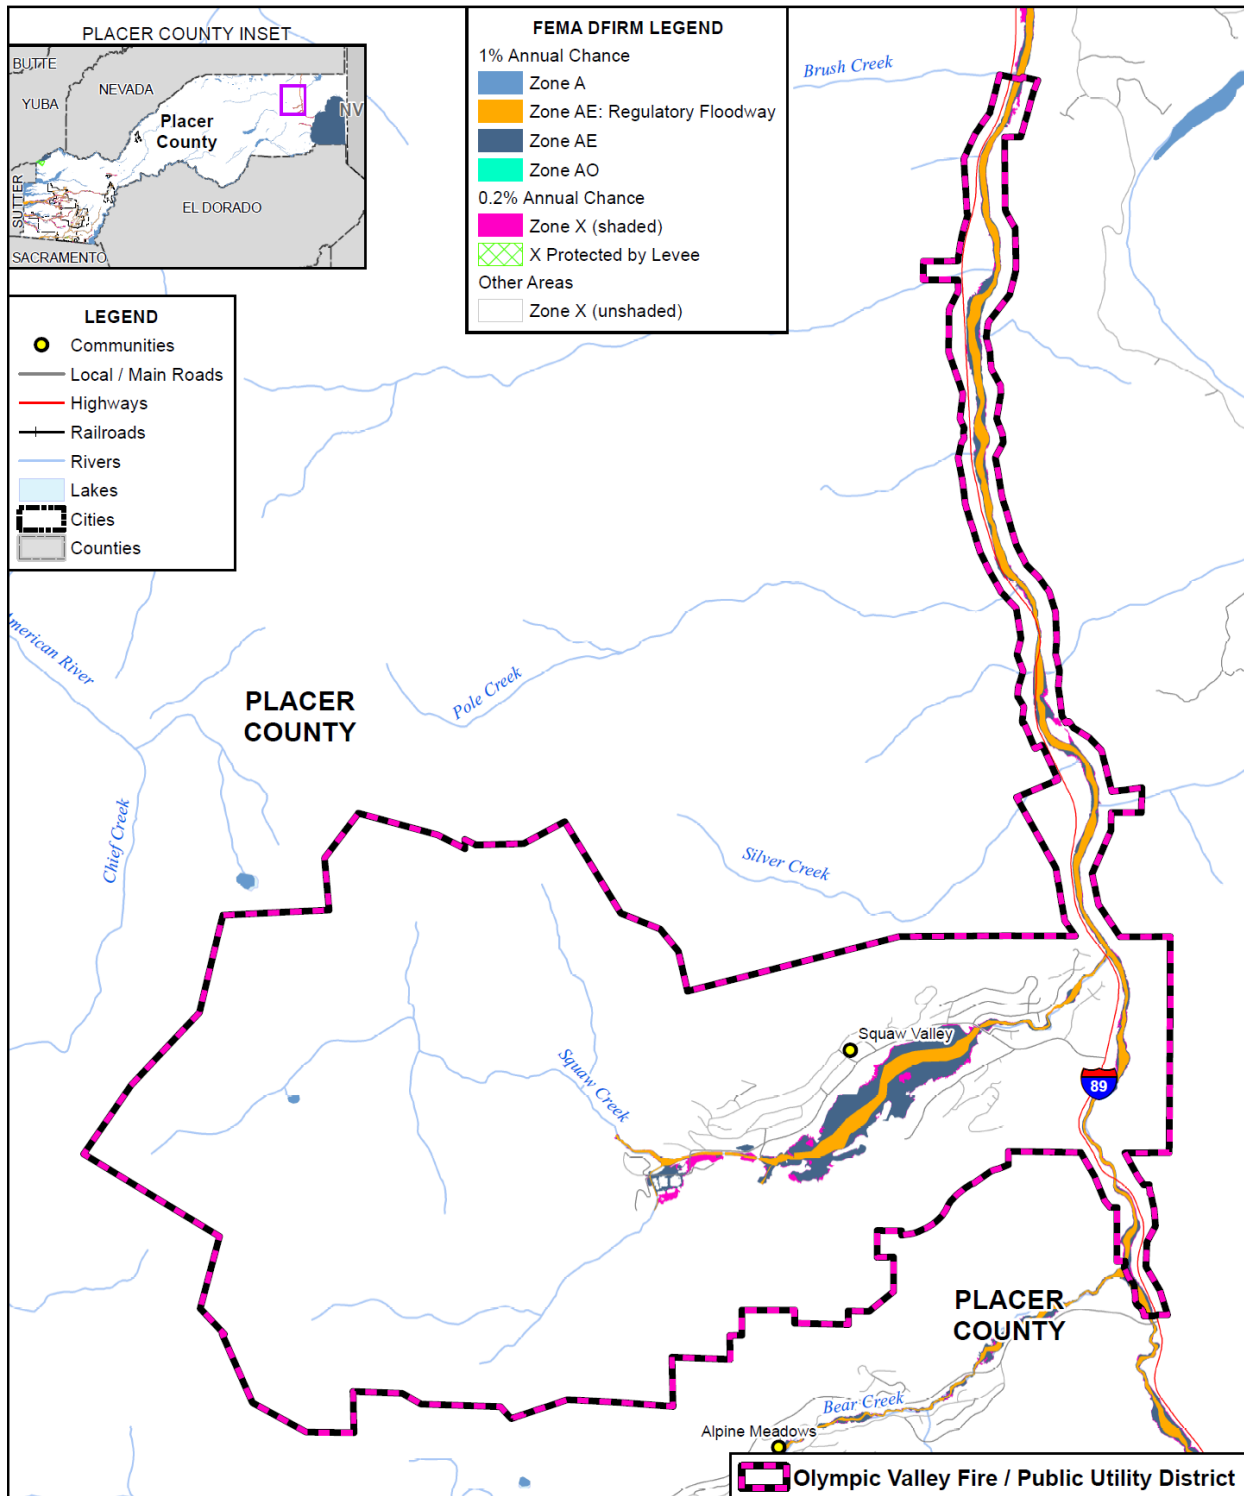

As previously described in Section 4.3.12 of the Base Plan, the Placer County Planning Area and the OVFD/OVPSD have been subject to historical flooding.

Location and Extent

The Olympic Valley watershed is a small subalpine and alpine watershed covering an area of approximately 8.2 square miles. It is characterized by steep, mountainous slopes draining to and through the limited valley area. The watershed includes the drainages of the North Fork, the South Fork, and the main stem of Squaw Creek. Watershed elevations range from approximately 6,200 feet on the valley floor up to 9,000 feet on the highest peaks adjacent to the valley. Squaw Creek and its tributaries are the only significant surface water bodies in Olympic Valley. The two main forks converge in an area known as the confluence at the western end of the valley. The confluence is a wide gravel-filled portion of Squaw Creek that has been altered due to gravel mining. The primary source of Squaw Creek's annual flow is snowmelt. The snowmelt peaks in the spring and often continues through July and August when it starts to dry up.

The OVFD/OVPSD has areas located in the 1% annual chance floodplain. This is seen in Figure O-2.

Figure O-2 OVFD/OVPSD – FEMA DFIRM Flood Zones

FOSTER MORRISON CONSULTING

0 1 2 Miles

COUNTY OF Placer

Data Source: FEMA DFIRM 11/2/2018, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Table O-6 details the DFIRM mapped flood zones within the 1% annual chance flood zone as well as other flood zones located within the District.

Table O-6 OVFD/OVPSD – DFIRM Flood Hazard Zones

Flood Zone	Description	Flood Zone Present in the District
A	Areas subject to inundation by the 1% annual-chance flood event generally determined using approximate methodologies. Because detailed hydraulic analyses have not been performed, no Base Flood Elevations (BFEs) or flood depths are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE – Regulatory Floodway	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply. Different from AE in that it adds the water course and adjacent lands that must be reserved in order to discharge the base flood without increasing the water surface elevation by more than one foot.	
AH	An area inundated by 1% annual chance flooding (usually an area of ponding), for which BFEs have been determined; flood depths range from 1 to 3 feet	
AO	Areas subject to inundation by 100-year shallow flooding (usually sheet flow on sloping terrain) where average depths are between one and three feet	
Shaded X	500-year flood the areas between the limits of the 1% annual chance flood and the 0.2-percent-annual-chance (or 500-year) flood	
X Protected by Levee	An area determined to be outside the 500-year flood and protected by levee from 100-year flood	
X	Areas outside of known floodplains.	X

Source: FEMA

Additionally, flood extents can generally be measured in volume, velocity, and depths of flooding. Expected flood depths in the District vary, depending on the nature and extent of a flood event; specific depths are unknown. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Flooding in the District tends to have a shorter speed of onset, due to the amount of water that flows through the District.

Past Occurrences

A list of state and federal disaster declarations for Placer County from flooding is shown on Table O-7. These events also likely affected the District to some degree.

Table O-7 Placer County – State and Federal Disaster Declarations from Flood 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Flood (including heavy rains and storms)	16	1950, 1955, 1958 (twice), 1962, 1963, 1969, 1973, 1980, 1983, 1986, 1995 (twice), 1997, 2008, 2017	13	1955, 1958, 1962, 1964, 1969, 1983, 1986, 1995 (twice), 1997, 2006 (twice), 2017

Source: Cal OES, FEMA

Areas impacted by previous flooding include the North and South forks of Squaw Creek, through the Squaw Valley Ski Area and commercial property, including PlumpJack (Squaw Valley Inn) and Squaw Valley Lodge, and running the entire length of Olympic Valley to its merger with the Truckee River.

A flood event impacting the District occurred in **January of 2006**. Heavy rains (estimated at over 10 inches in three days) were the primary cause of this flood event. This flooding of Squaw Creek (estimated as a 50-year event) caused erosion, inflow to sewer system, power failures, road closures (from mudslides), and impacts to local businesses cut off by the flooding. Unlike the **1997** flood, there was no damage to the District’s facilities or infrastructure.

The District noted the **January 2017** flood caused significant amount of work to protect infrastructure and keep up with flood water. Flood event resulted in overtime and equipment use.

Vulnerability to and Impacts from Flood

Floods have been a part of the District’s historical past and will continue to be so in the future. During winter months, long periods of precipitation and the timing of that precipitation are critical in determining the threat of flood, and these characteristics further dictate the potential for widespread structural and property damages. Predominantly, the effects of flooding are generally confined to areas near the waterways of the County. As waterways grow in size from local drainages, so grows the threat of flood and dimensions of the threat. This threatens structures in the floodplain. Structures can also be damaged from trees falling as a result of water-saturated soils. Electrical power outages happen, and the interruption of power causes major problems. Loss of power is usually a precursor to closure of governmental offices and community businesses. Roads can be damaged and closed, causing safety and evacuation issues. People may be swept away in floodwaters, causing injuries or deaths.

Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits. Direct impacts, such as drowning, can be limited with adequate warning and public education about what

to do during floods. Other problems connected with flooding and storm water runoff include erosion, sedimentation, degradation of water quality, loss of environmental resources, and economic impacts.

Flooding and soil erosion due to heavy rains and snow runoff have been a historical problem. Abundant snowfall in the mountains combined with rain and steep terrain can mean rapid runoff and flooding. Water flow can be high in peak runoff periods with historical downstream flooding. The primary impacts from flooding within the District include damage to roads, utilities, bridges; and flooding of homes, businesses and critical facilities. Historically, mud slides and washouts associated with flooding caused the most damages within the District. The south fork of the Squaw Creek is generally impacted the most. Road closures create difficulties in providing emergency services to areas cut off by flooding and limit the area's ability to evacuate.

Assets at Risk

All of those identified in Table O-4 with flood in the righthand column.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Flooding occurs in areas other than the FEMA mapped 1% and 0.2% annual chance floodplains. Flooding may be from drainages not studied by FEMA, lack of or inadequate drainage infrastructure, or inadequate maintenance. Localized, stormwater flooding occurs throughout the County during the rainy season from November through April. Prolonged heavy rainfall contributes to a large volume of runoff resulting in high peak flows of moderate duration.

Location and Extent

The OVFD/OVPSD is subject to localized flooding throughout the District. Flood extents are usually measured in areas affected, velocity of flooding, and depths of flooding. Expected flood depths in the District vary by location. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Localized flooding in the District tends to have a shorter speed of onset, especially when antecedent rainfall has soaked the ground and reduced its capacity to absorb additional moisture.

The District tracks localized flooding areas. localized flood areas identified by the OVFD/OVPSD are summarized in Table O-8.

Table O-8 OVFD/OVPSD – List of Localized Flooding Problem Areas

Road Name	Flooding	Pavement Deterioration	Washouts	High Water/ Creek Crossing	Landslides/ Mudslides	Debris	Downed Trees
Squaw Valley Road 2 locations	X			Tributary of Squaw Creek		X	
Squaw Peak Road	X			South Fork Squaw Creek			

Source: OVFD/OVPSD

Past Occurrences

There have been no federal or state disaster declarations in the County due to localized flooding. The District noted no past occurrences of localized flooding since 2016.

Vulnerability to and Impacts from Localized Flooding

Historically, much of the growth in the District and County has occurred adjacent to streams, resulting in significant damages to property, and losses from disruption of community activities when the streams overflow. Additional development in the watersheds of these streams affects both the frequency and duration of damaging floods through an increase in stormwater runoff.

Primary concerns associated with stormwater flooding include life safety issues, and impacts to property and to infrastructure that provides a means of ingress and egress throughout the community. Ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Objects can also be buried or destroyed through sediment deposition. Floodwaters can break utility lines and interrupt services. Standing water can cause damage to crops, roads, and foundations. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

Assets at Risk

All of those identified in Table O-4 with flood in the righthand column.

Landslide, Mudslide, Debris Flows

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

According to the California Geological Survey, landslides refer to a wide variety of processes that result in the perceptible downward and outward movement of soil, rock, and vegetation under gravitational influence. Common names for landslide types include slump, rockslide, debris slide, lateral spreading,

debris avalanche, earth flow, and soil creep. Landslides may be triggered by both natural and human-induced changes in the environment that result in slope instability.

The susceptibility of an area to landslides depends on many variables including steepness of slope, type of slope material, structure and physical properties of materials, water content, amount of vegetation, and proximity to areas undergoing rapid erosion or changes caused by human activities. These activities include mining, construction, and changes to surface drainage areas. Landslide events can be determined by the composition of materials and the speed of movement. A rockfall is dry and fast while a debris flow is wet and fast. Regardless of the speed of the slide, the materials within the slide, or the amount of water present in the movement, landslides are a serious natural hazard.

Debris flows, can also occur in some areas of the County and the District. These debris flows generally occur in the immediate vicinity of existing drainage swales or steep ravines. Debris flows occur when near surface soil in or near steeply sloping drainage swales becomes saturated during unusually heavy precipitation and begins to flow downslope at a rapid rate. Debris flows are also common during the rainy season in post fire areas.

Location and Extent

Landslides, mudslides, and debris flows can affect certain areas of the District. The CGS has estimated that the risk varies across the District and has created maps showing risk variance. This risk variance falls into multiple categories. These are discussed in Section 4.3.14 of the Base Plan. According to the District Planning Team, risk varies within the District range from moderate to high. The speed of onset of landslide is often short, especially in post-wildfire burn scar areas, but it can also take years for a slope to fail. Landslide duration is usually short, though digging out and repairing landslide areas can take some time.

Past Occurrences

There have been no federal or state disaster declarations in the County from landslide. Given the geology, climate, and terrain of the District, landslides can be a significant concern. Notable landslides of record include the landslides occurring along the Truckee River, Squaw Creek and Bear Creek rivers associated with the 1997 flood event. These include the Wayne Road, Sandy Way, and Navajo Court landslides.

The Sandy Way mudslide area has had several significant releases – the first in about 1983 and the second in 1997. Following the 1983 event, the portion of the drainage just above Sandy Way was widened and deepened somewhat and a larger culvert installed. Debris was removed from the areas downhill of Sandy Way, but the stream channel was not altered significantly nor were improvements constructed. Following the 1997 event (which accompanied significant and widespread flooding and mudslides/debris flows in other areas) the Sandy Way improvements were cleaned out, with little change and without installation of further improvements. The area remains questionable today – it will very likely release again, given similar rainfall intensity and duration.

Vulnerability to and Impacts from Landslide

Although landslides are primarily associated with slopes greater than 15 percent, they can also occur in relatively flat areas and as cut-and-fill failures, river bluff failures, lateral spreading landslides, collapse of

wine-waste piles, failures associated with quarries, and open-pit mines. Landslides may be triggered by both natural- and human-caused activity.

The District has identified several areas prone to landslides that were discussed in the Past Occurrences section above. Impacts in the District may be to structures, infrastructure, and to life safety

Assets at Risk

All of those identified in Table O-4 with landslide in the righthand column.

Severe Weather: Freeze and Snow

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to the NWS and the WRCC, winter snow storms can include heavy snow, ice, and blizzard conditions. Heavy snow can immobilize a region, stranding commuters, stopping the flow of supplies, and disrupting emergency and medical services. Accumulations of snow can collapse roofs and knock down trees and power lines. In rural areas, homes and farms may be isolated for days, and unprotected livestock may be lost. The cost of snow removal, damage repair, and business losses can have a tremendous impact on cities and towns.

Heavy accumulations of ice can bring down trees, electrical wires, telephone poles and lines, and communication towers. Communications and power can be disrupted for days until the damage can be repaired. Power outages can have a significant impact on communities, especially critical facilities such as public utilities. Even small accumulations of ice may cause extreme hazards to motorists and pedestrians.

Some winter storms are accompanied by strong winds, creating blizzard conditions with blinding wind-driven snow, severe drifting, and dangerous wind chills. Strong winds accompanying these intense storms and cold fronts can knock down trees, utility poles, and power lines. Blowing snow can reduce visibility to only a few feet in areas where there are no trees or buildings. Serious vehicle accidents with injuries and deaths can result. Freezing temperatures can cause significant damage to the agricultural industry.

Location and Extent

Freeze and snow are regional issues, meaning the entire District is at risk to cold weather and freeze events. While there is no scale (i.e. Richter, Enhanced Fujita) to measure the effects of freeze, the WRCC reports that in a typical year, minimum temperatures fall below 32°F on 209.0 days with 0.4 days falling below 0°F in eastern Placer County. Snowfall is measured in depths, and the WRCC reports that average snowfall on the eastern side of the County is 190.7 inches. Freeze and snow has a slow onset and can be generally be predicted in advance for the County. Freeze events can last for hours (in a cold overnight), or for days to weeks at a time. Snow event can last for hours or days, and the snow stays all winter in the eastern portion of the County, often with significant snow depths.

Past Occurrences

There has been no federal and one state disaster declarations in the County for freeze and snow, as shown on Table O-9.

Table O-9 Placer County – State and Federal Disaster Declarations from Freeze and Snow 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Freeze	1	1972	0	–

Source: Cal OES, FEMA

The District noted that cold and freeze is a regional phenomenon; events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.3.

According to the District, major winter storms have routinely cut off transportation routes in the District for hours (March 2007) to over a week (back in the 1950s), stranding thousands and causing a major impact to services and supplies.

Vulnerability to and Impacts from Severe Weather: Freeze and Snow

The District experiences temperatures below 32 degrees during the winter months. Freeze can cause injury or loss of life to residents of the District. While it is rare for buildings to be affected directly by freeze, damages to pipes that feed building can be damaged during periods of extreme cold. Freeze and snow can occasionally be accompanied by high winds, which can cause downed trees and power lines, power outages, accidents, and road closures. Transportation networks, communications, and utilities infrastructure are the most vulnerable physical assets to impacts of severe winter weather in the County.

The District noted that deep freezes with no snow cover can go deep enough into the ground to freeze pipelines and facilities. Heavy snow can limit access to pipeline or facilities if there were issues going at the same time as heavy snow.

Extreme Cold and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

Assets at Risk

All of those identified in Table O-4 with freeze or snow in the righthand column.

Severe Weather: Heavy Rains and Storms (Hail, Lightning)

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Storms in the District occur annually and are generally characterized by heavy rain often accompanied by strong winds and sometimes lightning and hail. Approximately 10 percent of the thunderstorms that occur each year in the United States are classified as severe. A thunderstorm is classified as severe when it contains one or more of the following phenomena: hail that is three-quarters of an inch or greater, winds in excess of 50 knots (57.5 mph), or a tornado. Heavy precipitation in the District falls mainly in the fall, winter, and spring months.

Location and Extent

Heavy rain events occur on a regional basis. Rains and storms can occur in any location of the District. All portions of the District are at risk to heavy rains. Most of the severe rains occur during the fall, winter, and spring months. There is no scale by which heavy rains and severe storms are measured. Magnitude of storms is measured often in rainfall and damages. The speed of onset of heavy rains can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of severe storms in California, Placer County, and the District can range from minutes to hours to days. Information on precipitation extremes can be found in Section 4.3.4 of the Base Plan.

Past Occurrences

There have been past disaster declarations from heavy rains and storms, which were discussed in Past Occurrences of the flood section above. According to historical hazard data, severe weather, including heavy rains and storms, is an annual occurrence in the District. This is the cause of many of the federal disaster declarations related to flooding. Protection of District facilities can cause significant overtime and a chance of damages to facilities.

Vulnerability to and Impacts from Heavy Rain and Storms

Heavy rain and severe storms are the most frequent type of severe weather occurrences in the District. These events can cause localized flooding. Elongated events, or events that occur during times where the ground is already saturated can cause 1% and 0.2% annual chance flooding. Wind often accompanies these storms and has caused damage in the past. Hail and lightning are rare in the District.

Actual damage associated with the effects of severe weather include impacts to property, critical facilities (such as utilities), and life safety. Heavy rains and storms often result in localized flooding creating significant issues. Roads can become impassable and ground saturation can result in instability, collapse,

or other damage to trees, structures, roadways and other critical infrastructure. Floodwaters and downed trees can break utilities and interrupt services.

During periods of heavy rains and storms, power outages can occur. These power outages can affect pumping stations and lift stations that help alleviate flooding.

Heavy rains and severe thunderstorms have occurred frequently in Squaw Valley and are likely to occur annually. These events are known to cause localized flooding, erosion, and damage to utility infrastructure. High winds are associated with frequent power loss and although the District maintains 3 emergency generators, personnel responding are often confronted with travel delay due to road closures.

Assets at Risk

All of those identified in Table O-4 with weather or flood in the righthand column.

Tree Mortality

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, and contribute to future fuel loads in forests surrounding communities. During extended drought, tree mortality is driven by a build-up in endemic bark beetle populations and exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events.

Location and Extent

Onset of tree mortality events can be relatively fast; however conditions – such as high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas, and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 - 40 dead trees per acre
- Orange depicting 5 -15 dead trees per acre
- Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A number of Placer County areas were designated during this event and the majority of Placer County

watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality, along with numerous Tier 1 High hazard “hot spots”. A map of these areas was shown in in Section 4.3.18 of the Base Plan.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015. No events of past tree mortality have affected the District.

Vulnerability to and Impacts from Tree Mortality

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead trees within the wildland urban intermix or wildland urban interface or urban areas therefore pose a greater risk to due to their proximity to residents, businesses, and road, power, and communication infrastructure.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure.

The trees within the District are unnaturally dense due to fire suppression and previous logging practices, the area is showing signs of inter-tree competition and significant widespread pathogen outbreaks including tree fungal infections in the firs, and heavy mistletoe infections in lodgepole pine and Jeffery pine. Historically, this forest was open and ‘park-like’ with significantly fewer trees and dominated by large diameter pine species.

Assets at Risk

All of those identified in Table O-4 with wildfire in the righthand column.

Wildfire

Likelihood of Future Occurrence–Highly Likely

Vulnerability–High

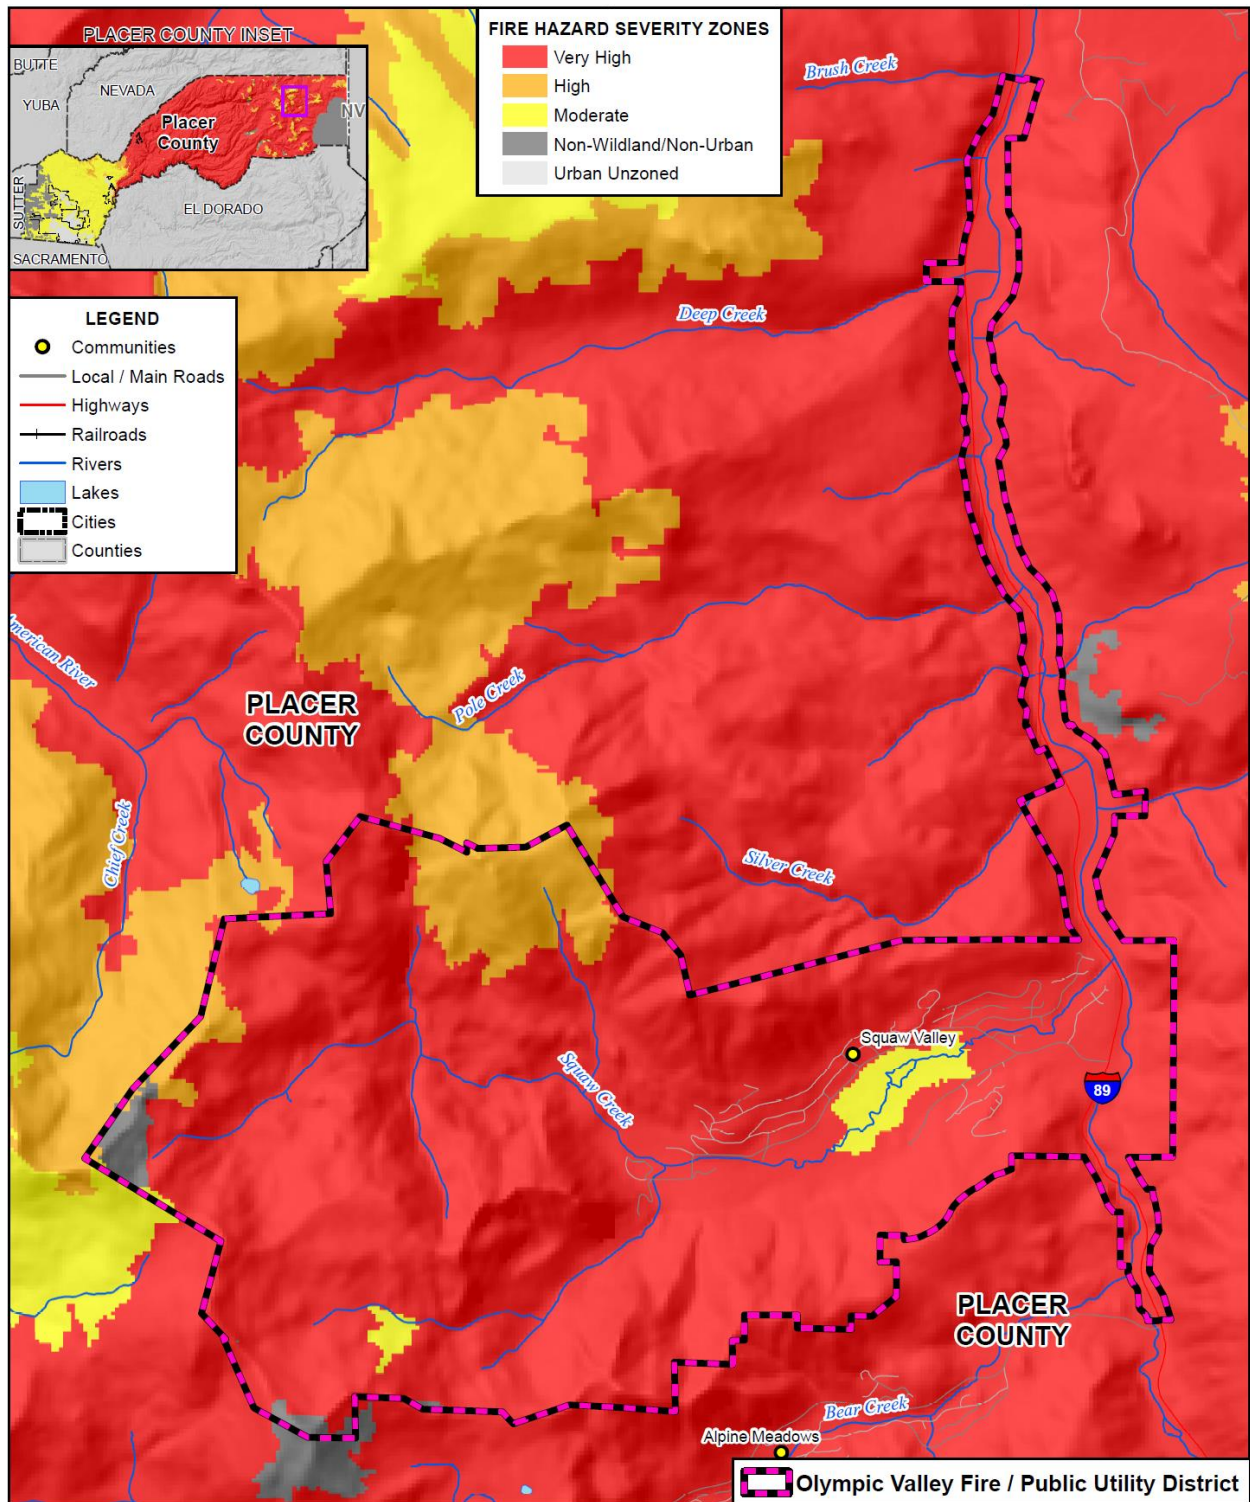

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the OVFD/OVPSD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the OVFD/OVPSD were created. Figure O-3 shows the CAL FIRE FHSZ in the District. As shown on the maps, FHSZs in the District range from High to Very High.

Figure O-3 OVFD/OVPSD – Fire Hazard Severity Zones

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table O-10.

Table O-10 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

The most recent major wildfires to impact the District were the Angora and Washoe Fires in 2007, in which over 260 homes were lost, and the 2014 King Fire. The king Fire grew to over 97,000 acres and burned within about 6 miles of the District boundary. It was particularly concerning because of the extreme fire behavior exhibited - including a ten mile run over the course of a few hours in the middle of the night – and it actually caused fire managers and scientists studying fire behavior to reconsider whether accepted norms of fire behavior needed to be reexamined. These are only a few examples of recent, larger wildfire events in the Lake Tahoe Basin and eastern Placer County. The District noted no other wildfires since 2016.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

As more people live in the area on a full-time basis and recreational uses and accompanying impacts increase, there will be more human-caused wildfire starts each year. Of greater concern is the increased number and value of homes developed within the WUI areas of the District. This adds greatly to the complexity and cost of fighting these fires – the ‘values at risk’ continue to escalate.

Olympic Valley has only one means of ingress and egress as a result of the configuration of the Valley, this will never change. Furthermore, a single road connects Olympic Valley to adjoining communities - California State Route 89 - this can never change because of the configuration of the Truckee River canyon. Evacuating the community or getting a large number of fire suppression resources to the Valley over a single road clogged with panicked residents trying to flee a wildland fire of significant size would be a daunting challenge indeed. Because of the steep terrain and dense forest immediately adjacent to the roadway, it is likely that these routes would have to be closed during a major event, stranding many people - including many visitors - away from their families and homes. To date there has been no loss of life attributed to the limited evacuation routes, but it is likely only a matter of time before people are cut off and trapped by a major fire event. The Valley has been isolated for days at a time by simultaneous avalanche and mudslide events on State Route 89.

Forest overgrowth due to the efficiency of modern firefighting techniques and to society’s current election to limit forest thinning and harvesting is a serious problem. If wildfire does not impact the forest first, native insects will eventually kill millions of trees. Explosions in insect populations usually start during a drought, when the lack of water combined with too many trees per acre render the trees too weak to fight off the insect attacks. Without a change in management practices on public lands, there is little hope of avoiding significant tree mortality similar to that experienced in other mountain environments in Southern California and Colorado.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California’s three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E and Liberty Utilities to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended

period. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

Assets at Risk

All of those identified in Table O-4 with wildfire in the righthand column.

O.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

O.6.1. Regulatory Mitigation Capabilities

Table O-11 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the OVFD/OVPSD.

Table O-11 OVFD/OVPSD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	1992 1994	Water& Sewer System Master Plans are being updated now and will be complete in 2022
Capital Improvements Plan	2007	Update as part of above master plan work
Economic Development Plan	N	Placer Co
Local Emergency Operations Plan	2016	
Continuity of Operations Plan	N	Water System Operations Plan is 80% complete Sewer System Management Plan 2020
Transportation Plan	NA	Placer Co
Stormwater Management Plan/Program	NA	Placer Co
Engineering Studies for Streams	2007	Placer County funded study by PWA
Community Wildfire Protection Plan	N	Defensible Space Program see 2010 plan description
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	Placer Co
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	NA	Version/Year: Placer Co
Building Code Effectiveness Grading Schedule (BCEGS) Score	NA	Score: Placer Co

Fire department ISO rating:	Y	Rating: 2 in Valley hydrant areas, 2Y in river corridor
Site plan review requirements	Y	
Is the ordinance an effective measure for reducing hazard impacts?		
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	Y	Placer Co
Subdivision ordinance	N	Placer Co
Floodplain ordinance	NA	Placer Co
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	Placer Co
Flood insurance rate maps	N	Placer Co
Elevation Certificates	NA	Placer Co
Acquisition of land for open space and public recreation uses	N	Placer Co
Erosion or sediment control program	N	Placer Co
Other		District Ordinances including Water Code, Sewer Code, and Fire Prevention Code
How can these capabilities be expanded and improved to reduce risk?		
The District will look at expanding our ordinances and partnering with other agencies (example we signed MOU w Placer County for Haz-Veg abatement)		

Source: OVFD/OVPSD

Olympic Valley Groundwater Management Plan, 2007

The Olympic Valley Groundwater Management Plan summarizes the plan process, existing groundwater and surface water conditions, and explores options for providing a sustainable water supply for current and future beneficial uses. An update of the Olympic Valley Groundwater Management Plan will be completed in 2016.

Codes and Ordinances

Avalanche

Placer County's avalanche management program defines Potential Avalanche Hazard Areas (PAHAs) where the minimum probability of avalanche occurrence is 1 in 100 per year or where avalanche damage has already occurred. According to the Placer County Avalanche Ordinance the following information must be disclosed in PAHAs:

- Identification that a structure is within a PAHA;
- A warning that avalanche control work is conducted in the area and avalanche warnings will be provided as feasible; and
- Identification of sources that provide weather information and general information on avalanches.

In addition, the County limits construction as necessary in PAHAs and will not issue a building permit for construction in a PAHA without certifying that the structure will be safe under the anticipated snow loads and conditions of an avalanche.

Olympic Valley Public Services District Codes and Permits

OVFD/OVPSD has enacted several codes:

- Water Code
- Sanitary Sewer Code
- Fire Prevention Code

In addition, the District has permit requirements specific to:

- Residential Construction
- Commercial Construction
- Multiple Dwelling Units
- Temporary Discharge into Sewer
- Temporary Fire Hydrant Connection

O.6.2. Administrative/Technical Mitigation Capabilities

The District is governed by a five-member Board of Directors elected to four-year terms. Registered voters within District boundaries are eligible to run for office. The Board of Directors approves District codes and policies. Placer County provides the District with the resources of a planner/engineer with knowledge of land development and management practices. The District also utilizes the services of a building official and GIS staff from Placer County. The District also participates in the County’s teleminder system for people residing with District boundaries. Table O-12 identifies the District department(s) responsible for activities related to mitigation and loss prevention in OVFD/OVPSD.

Table O-12 OVFD/OVPSD’s Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	Placer Co
Mitigation Planning Committee	N	Placer Co
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Defensible Space program
Mutual aid agreements	Y	Tahoe Truckee Area Emergency Contingency Plan Fire Dept. Mutual Aid Agreement
Other		
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	N	Placer Co
Floodplain Administrator	N	Placer Co
Emergency Manager	N	
Community Planner	N	Placer Co
Civil Engineer	Y	General Manager Mike Geary

GIS Coordinator	Y	District Engineer Dave Hunt
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Everbridge
Hazard data and information	N	Placer Co
Grant writing	Y	Staff
Hazus analysis	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Continued updates to the capabilities identified above help improve the response and prevention of identified risks.		

Source: OVFD/OVPSD

O.6.3. Fiscal Mitigation Capabilities

Table O-13 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table O-13 OVFD/OVPSD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Squaw Creek Embankment Reinforcement Project
Authority to levy taxes for specific purposes	N	Restricted by Prop 218
Fees for water, sewer, gas, or electric services	Y	Water and Sewer Asset Replacement Plan
Impact fees for new development	Y	Fire Department Apparatus Asset Replacement Plan
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	Y	
State funding programs	Y	Member of Tahoe Sierra Integrated Water Management Plan
Other		
How can these capabilities be expanded and improved to reduce risk?		
Identifying future funding opportunities will enable the District to pursue some of the mitigation projects that have been identified.		

Source: OVFD/OVPSD

O.6.4. Mitigation Education, Outreach, and Partnerships

Table O-14 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table O-14 OVFD/OVPSD’s Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	Biannual newsletter
Natural disaster or safety related school programs	N	Not known
StormReady certification	N	
Firewise Communities certification	Y	
Public-private partnership initiatives addressing disaster-related issues	N

How can these capabilities be expanded and improved to reduce risk?		
The District is completing a Community Wildfire Preparedness Plan (CWPP) to identify and prioritize programs such as those noted above, expected completion date of April 2022.		

Source: OVFD/OVPSD

The District attempts to work with the local community and solicit public comment and involvement in District programs, system improvements and upgrades. Considerable public outreach and participation was extended during the development and adoption of the Olympic Valley Groundwater Management Plan, preparation and certification of a Supplemental EIR for the Resort at Squaw Creek’s Phase II Expansion, as well as numerous system upgrade projects.

O.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

- In 2016 the District as part of a project to produce an Operations Plan updated the Emergency Response Plan
- In 2020 the District completed and adopted a Sewer System Management Plan
- In 2015 the District as part of the Village Master Plan completed a Water Supply Assessment funded by the developer. The WSA looked at projected growth over the next 25 years and modeled impacts to the Olympic Valley Aquifer during multiple drought years. The study shows the Olympic Valley Aquifer is not presently in overdraft and should sustain the growth proposed.

- The District is presently working on a study funded by DWR titled Redundant Water Supply Preferred Alternative Analysis. This study lays the groundwork for a system intertie with the Truckee Donner PUD & Northstar Community Services Districts

Squaw Creek Embankment Reinforcement Project: As a result of bank erosion from a 1986 flood event, the Olympic Valley sewer export line that runs adjacent to Squaw Creek was being threatened. In 1989, the bank was reinforced using boulder rip rap. In 2000, the District completed a \$400,000 plus project to armor a 400 foot reach of Squaw Creek where the 1997 flood threatened the Olympic Valley Interceptor sewer main, a pipeline that carries 100 percent of the valley's effluent.

Defensible Space Program: The OVFD/OVPSD has had a defensible space program for the past 20 years. This program entails a physical inspection of every property in the District's jurisdiction for compliance with California's defensible space laws. Properties that are not in compliance at the time of the first inspection receive follow-up visits and notices until they are brought into compliance. Every property complies with the defensible space regulations every year. The inspection checklist includes:

- Making sure the street address is visible from the street and contrasts with background—suggested 5" or 6" numbers.
- Cut grasses and mule ears 6" or shorter to 100' from house or to property line.
- Rake and remove pine needles to 100' from house or to property line—okay to leave 1-2" for mulch.
- Remove accumulated pine needles from the roof.
- Cut grasses, thin brush and other flammable vegetation to 100' from house or to the property line.
- Clear debris (slash, pine needle piles, construction debris and flammable storage) from around the structure.
- Clear vegetation to mineral soil around firewood storage piles.
- Remove brush, limbs, grass, needles and debris 10' in all directions from around propane tanks.
- Limb adult trees up to a minimum of 6' from the ground.
- Remove dead tree limbs touching or overhanging roofs and decks.
- Remove all tree limbs a minimum of 10' from chimneys and stovepipes.
- Remove all dead and dying trees from the property.
- Install a ½ inch mesh screen spark arrester on chimneys and stovepipes

O.7 Mitigation Strategy

O.7.1. Mitigation Goals and Objectives

The OVFD/OVPSD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

O.7.2. Mitigation Actions

The planning team for the OVFD/OVPSD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Avalanche
- Dam Failure
- Earthquake
- Floods: 1%/0.2% annual chance
- Floods: Localized Stormwater
- Landslides, Mudslides, and Debris Flows
- Severe Weather: Freeze and Snow
- Severe Weather: Heavy Rains and Storms
- Tree Mortality
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Community-Wide Emergency Notification System

Hazards Addressed: Earthquake, Avalanche, Dam Failure, Drought, Floods, Landslides, Severe Weather, Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The population of Olympic Valley can increase more than ten-fold over the course of several hours on a Saturday morning. Presently, there is no way of effectively alerting most residents and visitors of a hazard and the actions to be taken in response.

A community-wide emergency notification system could be implemented with relative ease and cost-efficiency in a compact area like Olympic Valley. Permanent, changeable message boards located along Squaw Valley Road at the west and east ends of the Valley could be used to alert residents and visitors of a hazard and refer them to the frequency for a low-power FM transmitter that would transmit more detailed information and recommended courses of action.

Other Alternatives:

- No action
- Emergency siren/air horn

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Office/Partners: Olympic Valley Fire Department

Cost Estimate: Approximately \$100,000

Benefits (Losses Avoided): Ability to notify a large number of people in the area of existing disaster or another emergency. Ability to direct people to tune their radio to a certain frequency to get further information and instructions.

Potential Funding: Potentially funded by a grant or combination of grants.

Timeline: Depending on funding

Project Priority: High

Action 2. Emergency Water Supply Interconnection to Martis Valley

Hazards Addressed: Contamination of sole source aquifer, loss of source wells due to disaster, earthquake, and drought. Wildland fire mitigation through increased fire protection services

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The community of Olympic Valley draws its drinking water from a single source aquifer that is very small, unprotected and is very sensitive. Source water travels rapidly through the aquifer making contamination of the supply of deep concern. Prolonged or extended drought consistent with changing global weather patterns could lead to overdraft of the limited supply.

Olympic Valley is geographically separate from outlying communities that may provide an emergency interconnection. A feasibility study conducted in 2009 determined that a connection to the Truckee Donner PUD or the Northstar CSD to be feasible with no fatal flaws in securing water rights, environmental constraints, or rights of way.

The purpose of the project is to provide a redundant source of supply that is geographically diverse with a reliable means of delivery. The delivery system will provide water service and fire protection to outlying areas while providing a utility corridor for natural gas and high speed communication.

Other Alternatives: The Redundant Water Supply Preferred Alternative Analysis, Farr West Engineering 2015 looked at alternatives in depth and determined that the connection to the Martis Valley Aquifer to be the best most reliable and feasible alternative

Existing Planning Mechanism(s) through which Action Will Be Implemented: The feasibility study and the alternatives analysis were funded by the California Department of Water Resources through Prop. 89. The District will seek additional funding through Prop. 1. The next phase of the project will be the environmental analysis under CEQA and securing permits.

Responsible Office/Partners: The Olympic Valley Public Service District is presently the lead agency for the project and has or is developing partnerships with the Placer County, Placer County Water Agency, Truckee Donner PUD, Northstar CSD, Tahoe City PUD, Alpine Springs CWD, Sudden Link Cable, Southwest Gas, and other state and local agencies

Cost Estimate: Planning level cost estimates range from \$23,520,000 to \$25,200,000 depending on the final alignment

Benefits (Losses Avoided): The project would provide an alternative water supply to multiple communities while bringing high speed fiber optics communication and natural gas to the area. The benefits of the project are increased fire protection along the Truckee River corridor between Truckee and Alpine Meadows where there currently is none. A partnership with Southwest Gas bringing natural gas to the area would lower fire danger by eliminating thousands of propane tanks and reducing on road transport by tanker trucks supplying propane. The project seeks to avoid loss of essential services during an emergency or natural disaster.

Potential Funding: Grants, partnerships, bonds, customer service fees

Timeline: CEQA and project permitting is the next phase. The timeline for permits ranges from 12 to 24 months with construction following final funding.

Project Priority: This project is a high priority

Action 3. OVPSD/Mutual Water Company Intertie

Hazards Addressed: Contamination of sole source aquifer, loss of source wells due to disaster, earthquake, and drought. Wildland fire mitigation through increased fire protection services.

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The community of Olympic Valley has 2 water systems that provide drinking water to its residents. An intertie would enable both systems to support the other with water in case of an issue due to natural disaster or operational issues.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: OVPSD has worked to receive grant funding to help further design the intertie and do further hydraulic modeling to find the best locations for an intertie.

Responsible Office/Partners: OVPSD

Cost Estimate: Planning level cost estimates range from \$500,000 to \$600,000 depending on final locations.

Benefits (Losses Avoided): The project would help ensure both systems had access to drinking water during and after a natural disaster. It would also offer operational redundancy when either system has maintenance or upgrade projects going on.

Potential Funding: Grants, partnerships, bonds, customer service fees.

Timeline: Ongoing pursuit of grants for planning funding.

Project Priority: This project is a high priority.

Action 4. Squaw Creek Siphon

Hazards Addressed: Flood, Landslide

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: During the 1997 flood the wastewater conveyance system in Squaw Valley was compromised due to erosion in multiple locations.

The Squaw Creek Siphon conveys wastewater from around 200 home across and under Squaw Creek where it ties into the Squaw Valley Interceptor. High velocity flood waters cut downward and eroded the creek bottom in the 1997 flood completely exposing the Squaw Creek Siphon. After the flood waters receded the District installed rock gabions upstream, downstream and over the Squaw Creek Siphon to protect the pipeline. The 1997 flood has been characterized by Placer County as a 50 year event, a similar or larger event would potentially damage or wash away the Squaw Creek Siphon causing wastewater to pollute Squaw Creek and the Truckee River.

The Squaw Creek Siphon Project seeks to replace the existing siphon with a redundant and larger siphon adjacent to and deeper than the existing siphon.

Other Alternatives: There are no feasible alternatives

Existing Planning Mechanism(s) through which Action Will Be Implemented: The OVPSD Sewer System Master Plan

Responsible Office/Partners: Olympic Valley Public Service District is the lead agency for the project

Cost Estimate: \$350,000 to \$400,000

Benefits (Losses Avoided): Avoids loss of critical facility and pollution of the environment

Potential Funding: Grants, loans, developer fees, service fees

Timeline: 5 to 10 years

Project Priority: Medium

Action 5. Water Tank Earthquake Retrofit Projects

Hazards Addressed: Earthquake, Landslide

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The District's East Tank (500,000 gal) was constructed in 1980 and is designed to withstand snow loads but not lateral stress from a substantial earthquake. The East tank is located up gradient from several single family homes that would be heavily impacted due to a tank failure.

The Mutual Water Company Steel Tank (300,000 gal) is located adjacent to a wash that sustained mud flows in the 1997 flood that caused significant erosion of the tanks earth foundation pad. Both Mutual Water Company Tanks are located up gradient from numerous single family homes that would be heavily impacted due to a tank failure.

The project would entail a seismic analysis by a qualified geotechnical firm of the Mutual water tanks and the Districts East Tank. Seismic retro-fit would be designed and employed if deemed necessary.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None.

Responsible Office/Partners: OVPSD

Cost Estimate: \$50,000 to \$500,000 depending on scope of project.

Benefits (Losses Avoided): Property protection and loss of lifeline services due to earthquake or land subsidence which could result in catastrophic tank failure

Potential Funding: Funding for the project may come from grants, low interest loan, or from District and Mutual Water Company reserves if or when available.

Timeline: 2022 or beyond depending on funding.

Project Priority: Medium

Action 6. Easement Abatement/Maintenance of Emergency Access

Hazards Addressed: Multi hazard (Avalanche, Dam Failure, Earthquake, Floods: 1%/0.2% annual chance, Floods: Localized Stormwater, Landslides, Mudslides, and Debris Flows, Severe Weather: Freeze and Snow, Severe Weather: Heavy Rains and Storms, Tree Mortality, Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: One way in and out of the valley

Other Alternatives: do nothing

Existing Planning Mechanism(s) through which Action Will Be Implemented: Emergency access/egress for wildland emergencies

Responsible Office/Partners: Placer County, State of California (Cal Fire), USFS

Cost Estimate: unknown

Benefits (Losses Avoided): avoid loss of life during wildland fire

Potential Funding: Grants and private partnerships

Timeline: unknown

Project Priority: High

Action 7. Towable Generator for Powering Booster Stations

Hazards Addressed: Wildfire, Earthquake, Floods, Dam Failure, Landslides, Severe Weather

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Olympic Valley PSD has a booster station that does not have an onsite generator. Currently a towable generator would be rented for a prolonged power outage. Purchasing a towable generator sized to run the booster station would increase resiliency of the water system through many kinds of disasters.

Other Alternatives: none

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Office/Partners: Olympic Valley Public Service District

Cost Estimate: Approximately \$50,000

Benefits (Losses Avoided): Ability to pump water into our highest zone during any kind of power outages. Continue to provide water during wildfire with the power out.

Potential Funding: Grants

Timeline: 2022 or 2023 depending on funding

Project Priority: medium

Action 8. Emergency Water Supply Interconnection to Martis Valley

Hazards Addressed: Contamination of sole source aquifer, loss of source wells due to disaster, earthquake, and drought. Wildland fire mitigation through increased fire protection services

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The community of Olympic Valley draws its drinking water from a single source aquifer that is very small, unprotected and is very sensitive. Source water travels rapidly through the aquifer making contamination of the supply of deep concern. Prolonged or extended drought consistent with changing global weather patterns could lead to overdraft of the limited supply.

Olympic Valley is geographically separate from outlying communities that may provide an emergency interconnection. A feasibility study conducted in 2009 determined that a connection to the Truckee Donner PUD or the Northstar CSD to be feasible with no fatal flaws in securing water rights, environmental constraints, or rights of way.

The purpose of the project is to provide a redundant source of supply that is geographically diverse with a reliable means of delivery. The delivery system will provide water service and fire protection to outlying areas while providing a utility corridor for natural gas and high speed communication.

Other Alternatives: The Redundant Water Supply Preferred Alternative Analysis, Farr West Engineering 2015 looked at alternatives in depth and determined that the connection to the Martis Valley Aquifer to be the best most reliable and feasible alternative

Existing Planning Mechanism(s) through which Action Will Be Implemented: The feasibility study and the alternatives analysis were funded by the California Department of Water Resources through Prop. 89. The District will seek additional funding through Prop. 1. The next phase of the project will be the environmental analysis under CEQA and securing permits

Responsible Office/Partners: The Olympic Valley Public Service District is presently the lead agency for the project and has or is developing partnerships with the Placer County, Placer County Water Agency, Truckee Donner PUD, Northstar CSD, Tahoe City PUD, Alpine Springs CWD, Sudden Link Cable, Southwest Gas, and other state and local agencies

Cost Estimate: Planning level cost estimates range from \$23,520,000 to \$25,200,000 depending on the final alignment

Benefits (Losses Avoided): The project would provide an alternative water supply to multiple communities while bringing high speed fiber optics communication and natural gas to the area. The benefits of the project are increased fire protection along the Truckee River corridor between Truckee and Alpine Meadows where there currently is none. A partnership with Southwest Gas bringing natural gas to the area would lower fire danger by eliminating thousands of propane tanks and reducing on road transport by tanker trucks supplying propane. The project seeks to avoid loss of essential services during an emergency or natural disaster

Potential Funding: Grants, partnerships, bonds, customer service fees

Timeline: CEQA and project permitting is the next phase. The timeline for permits ranges from 12 to 24 months with construction following final funding

Project Priority: Medium Priority

Annex P Placer County Flood Control and Water Conservation District

P.1 Introduction

This Annex details the hazard mitigation planning elements specific to Placer County Flood Control and Water Conservation District (PCFCWCD or District), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to PCFCWCD, with a focus on providing additional details on the risk assessment and mitigation strategy for this community.

P.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table P-1. Additional details on plan participation and District representatives are included in Appendix A.

Table P-1 PCFCWCD – Planning Team

Name	Position/Title	How Participated
Brad Brewer	District Manager	Attended meetings. Provided: hazard ID table, update to previous mitigation actions, new mitigation actions, input on assets at risk, updates to vulnerability sections of the Plan update. Reviewed and updated 2016 Annex and provided input on flood section of Base Plan.
Ken Grehm	Executive Director	Provided overall management of review and input.

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the District integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the District incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table P-2.

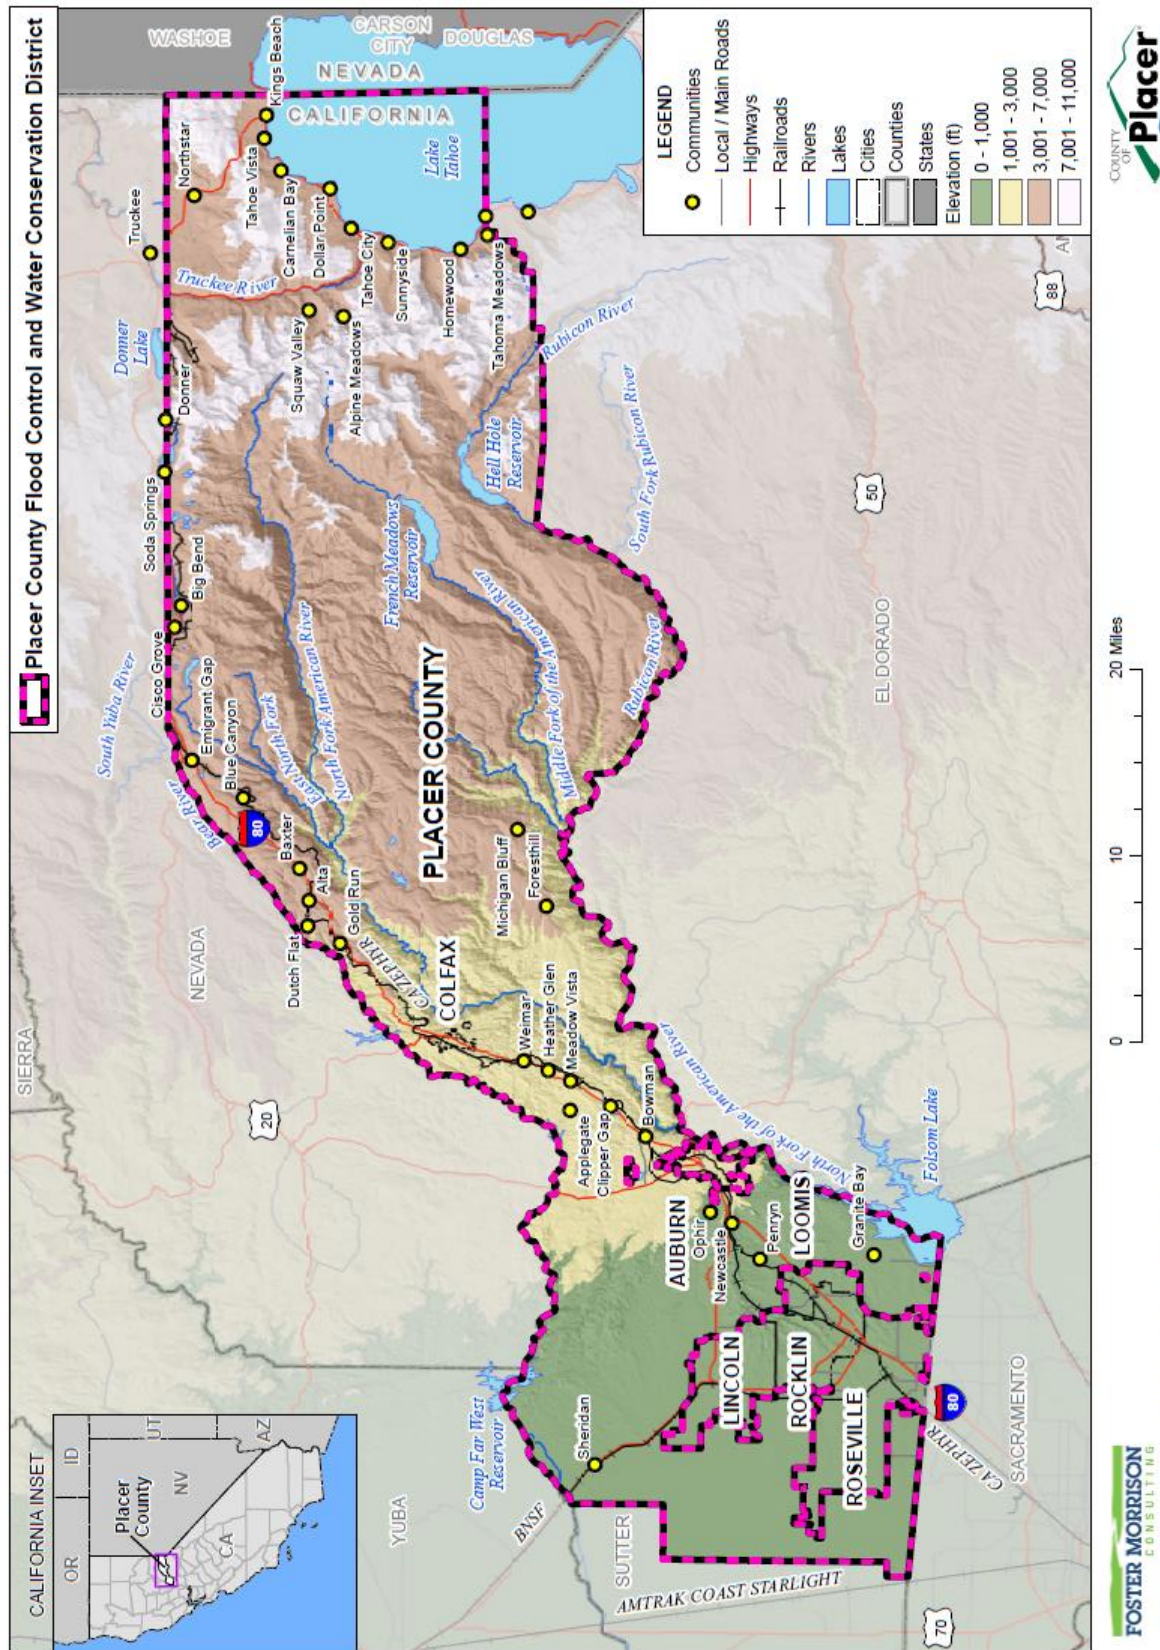

Table P-2 2016 LHMP Incorporation

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
District’s Annual Short-term and Long-Term (5-year) Work Plans	Incorporated updates to previous mitigation actions and new mitigation actions. Include future updates to LHMP into Short-Term or Long-Term Work Plans as needed
Annual Updates to District’s Flood Response Handbook	Included updates to hazards, mitigation actions, assets at risk, and vulnerability from Plan update.

P.3 District Profile

The District profile for the PCFCWCD is detailed in the following sections. Figure P-1 displays a map and the location of the District within Placer County.

Figure P-1 PCFCWCD

P.3.1. Overview and Background

The Placer County Flood Control and Water Conservation District was established in 1984 by the State Legislature as a Special District, separate from County government, to address flood control issues arising with growth. District boundaries are the same as Placer County boundaries.

The primary purpose of the District is to protect lives and property from the effects of flooding by comprehensive, coordinated flood prevention planning. The District uses consistent standards to evaluate flood risk, and implements flood control measures such as requiring new development to construct detention basins and operation and management of a flood warning system.

The District:

- Implements regional flood control projects;
- Develops and implements master plans for selected watersheds in the County;
- Provides technical planning, support and information during times of flood and drought for the cities, the County, and the development community;
- Operates and maintains the County flood warning system;
- Reviews proposed development projects to see they meet District standards;
- Develops hydrologic and hydraulic models for County watersheds; and
- Provides technical support for Office of Emergency Services activities.

P.4 Hazard Identification

PCFCWCD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table P-3).

Table P-3 PCFCWCD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	–	–	–	–	Medium
Avalanche	–	–	–	–	Medium
Climate Change	–	–	–	–	–
Dam Failure	Significant	Unlikely	Critical	High	Medium
Drought & Water Shortage	Significant	Likely	Critical	Medium	High
Earthquake					Low
Floods: 1%/0.2% annual chance	Significant	Occasional	Critical	High	Medium
Floods: Localized Stormwater	Significant	Likely	Limited	Medium	Medium
Landslides, Mudslides, and Debris Flows	–	–	–	–	Medium
Levee Failure	Significant	Unlikely	Limited	Medium	Medium
Pandemic	–	–	–	–	Medium
Seiche	–	–	–	–	Medium
Severe Weather: Extreme Heat	–	–	–	–	High
Severe Weather: Freeze and Snow	–	–	–	–	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Likely	Critical	Medium	Medium
Severe Weather: High Winds and Tornadoes	–	–	–	–	Low
Tree Mortality	–	–	–	–	High
Wildfire	Extensive	Highly Likely	Limited	Medium	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

Impacts of past events and vulnerability to specific hazards are discussed below (see Section 4.3 of the Base Plan for more detailed information about these hazards and their impacts on Placer County).

P.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District’s hazards and assess the District’s vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

P.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section P.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table P-3) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

P.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District’s total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the PCFCWCD’s assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table P-4 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. PCFCWCD’s physical assets, valued at \$5 million, consist of the infrastructure to support the District’s operations.

Table P-4 PCFCWCD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
Stream and rain gages	ALERT type gage (17 gages @\$12,000 each)	\$204,000	Theft, vandalism, damage due to flooding
Base station hardware	ALERT base station receiver/decoder and computer	\$22,000	Damage due to fire
Miners Ravine Off-Channel Detention Basin Facility and Dam	Regional Flood Control Facility	\$4,800,000	Damages due to flooding or dam failure
Antelope Flood Control Project, Upper Weir	Regional Flood Control Facility	\$2,400,000	Damages due to flooding
Total		\$7,426,000	

Source: PCFCWCD

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. PCFCWCD provides services to 396,691 residents of Placer County (CA Dept. of Finance, May 2020) including Auburn, Colfax, Lincoln, Loomis, Rocklin, and Roseville.

Natural Resources

PCFCWCD has a variety of natural resources of value to the District. These natural resources parallels that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan

Historic and Cultural Resources

PCFCWCD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallels that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan. Future expansion will include expanding flood warning system to include additional ALERT flood warning gages.

Development since 2016

Three new flood warning gages were installed in FEMA Special Flood Hazard Areas since 2016. These include Clover Valley Creek at Rawhide Road, Miners Ravine at Auburn Folsom Road, and Linda Creek at Auburn Folsom Road. One flood warning gage previously operated and maintained by the District (Pleasant Grove Creek at Industrial Avenue) was transferred to the City of Roseville.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

P.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table P-3 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.

- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Dam Failure

Likelihood of Future Occurrence—Unlikely

Vulnerability—High

Hazard Profile and Problem Description

Dams are manmade structures built for a variety of uses including flood protection, power generation, agriculture, water supply, and recreation. When dams are constructed for flood protection, they are usually engineered to withstand a flood with a computed risk of occurrence. For example, a dam may be designed to contain a flood at a location on a stream that has a certain probability of occurring in any one year. If prolonged periods of rainfall and flooding occur that exceed the design requirements, that structure may be overtopped or fail. Overtopping is the primary cause of earthen dam failure in the United States.

Location and Extent

Dam failure is a natural disaster from two perspectives. First, the inundation from released waters resulting from dam failure is related to naturally occurring floodwaters. Second, a total dam failure would most probably happen as a consequence of the natural disaster triggering the event, such as an earthquake. There is no scale with which to measure dam failure. However, Cal DWR Division of Safety of Dams (DOSD) assigns hazard ratings to dams within the State that provides information on the potential impact should a dam fail. The following two factors are considered when assigning hazard ratings: existing land use and land use controls (zoning) downstream of the dam. Dams are classified in four categories that identify the potential hazard to life and property: Low, Significant, High, and Extremely High. These were discussed in more detail in Section 4.3.9 of the Base Plan.

While a dam may fill slowly with runoff from winter storms, a dam break has a very quick speed of onset. The duration of dam failure is generally not long – only as long as it takes to empty the reservoir of water the dam held back. The District would be affected for as long as the flood waters from the dam failure took to drain downstream.

Dams inside the County that can affect the District can be seen on Figure P-2. Dams outside the County that can affect the District can be seen on Figure P-3.

Figure P-2 PCFCWCD – Dam Inundation Areas from Dams Inside the County

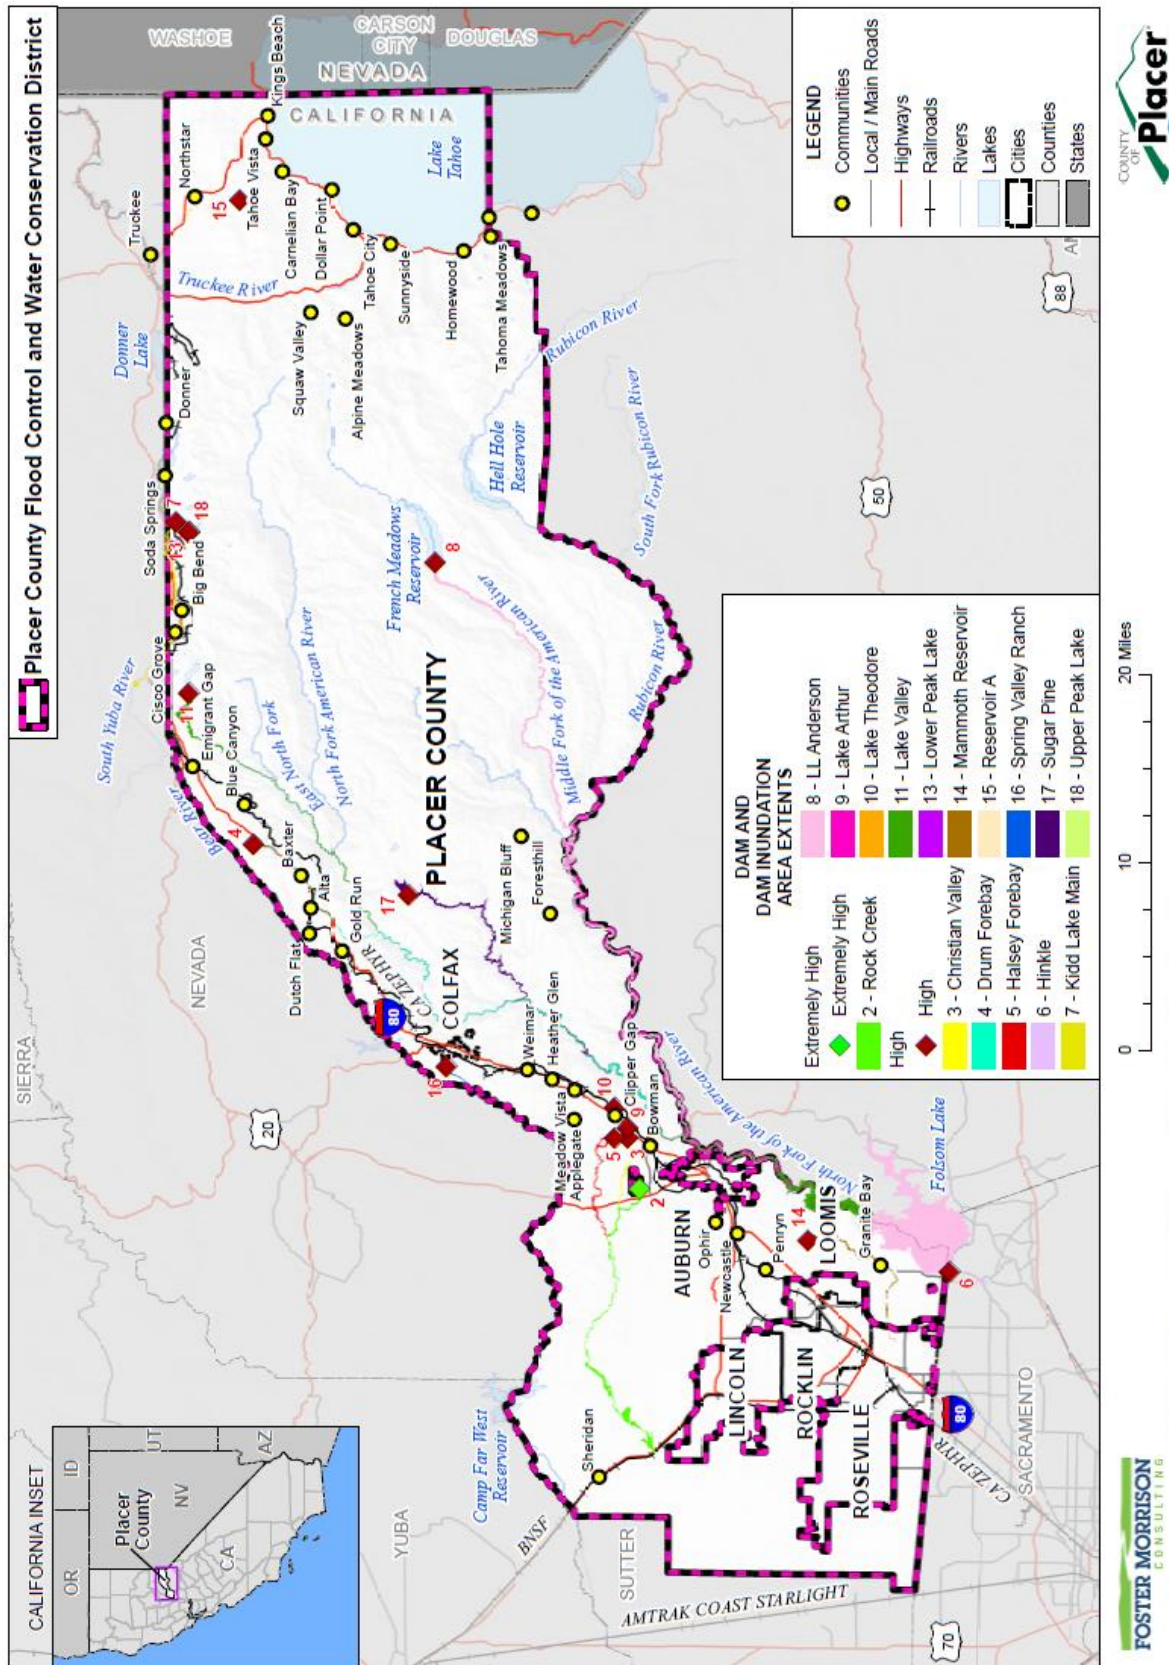

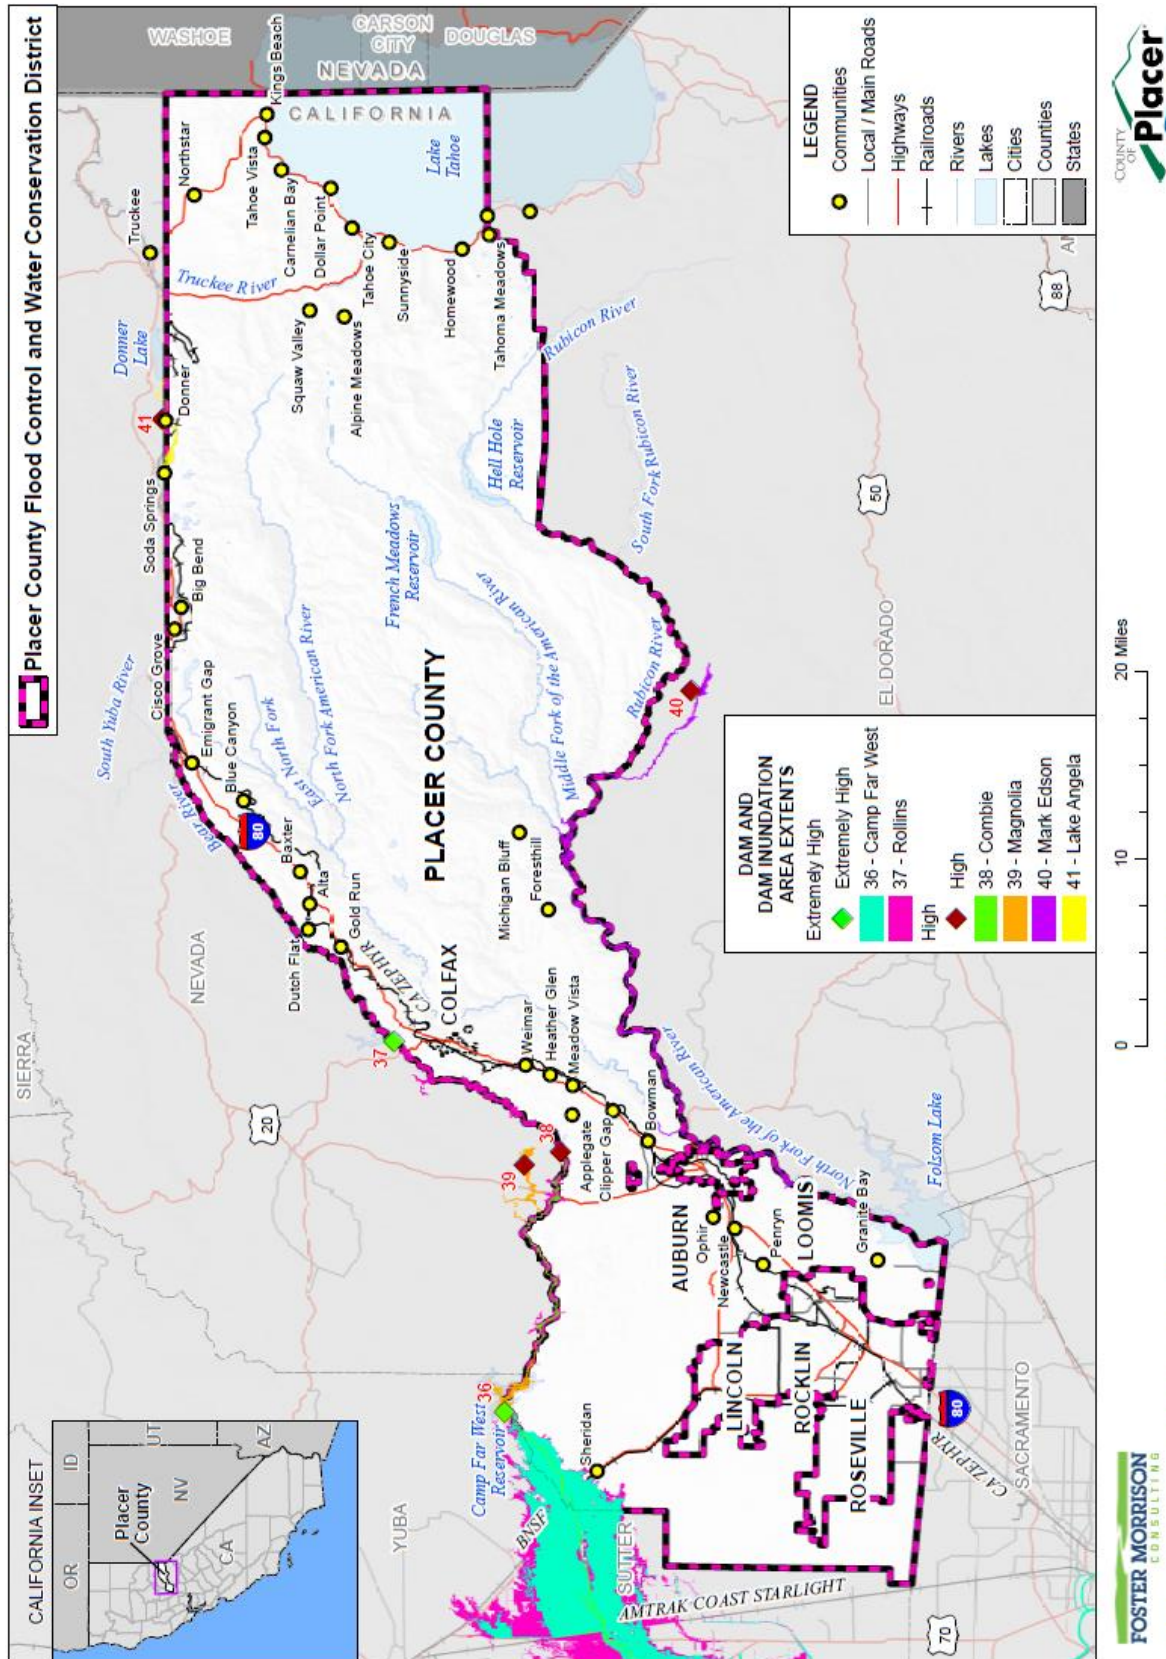

Figure P-3 PCFCWCD – Dam Inundation Areas from Dams Outside the County

Past Occurrences

There has been no federal or state disaster declarations for dam failure in the County. The District noted no other dam failure occurrences that have affected the District.

Vulnerability and Impacts from Dam Failure

Dam failure flooding would vary by community depending on which dam fails and the nature and extent of the dam failure and associated flooding. Impacts to the District from a dam failure flood could include loss of life and injury, flooding and damage to property and structures, damage to critical facilities and infrastructure, loss of natural resources, and all other flood related impacts. Additionally, mass evacuations and associated economic losses can also be significant.

Assets at Risk

Those agency assets located within flood inundation areas are the most vulnerable to extensive flooding caused by a dam failure. These include the District's ALERT system of stream level and rain gages listed in Table P-4, as well as the land improvements associated with the District's Miners Ravine Off-Channel Detention Basin Facility and dam located at 7500 Sierra College Boulevard in Roseville, California. A specific dam failure analysis prepared for the State Division of Safety of Dams exists for the District's Miners Ravine Off-Channel Detention Basin Facility and dam as prepared by RBF Consulting in October 2004.

Drought & Water Shortage

Likelihood of Future Occurrence—Likely

Vulnerability—Medium

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area's usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry

- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table P-5.

Table P-5 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

Assets at Risk

Flood warning system stream and rain gages, Miners Ravine Off-Channel Detention Basin Facility and Dam are at risk to this hazard.

Flood: 1%/0.2% Annual Chance

Likelihood of Future Occurrence—Occasional/Unlikely

Vulnerability—High

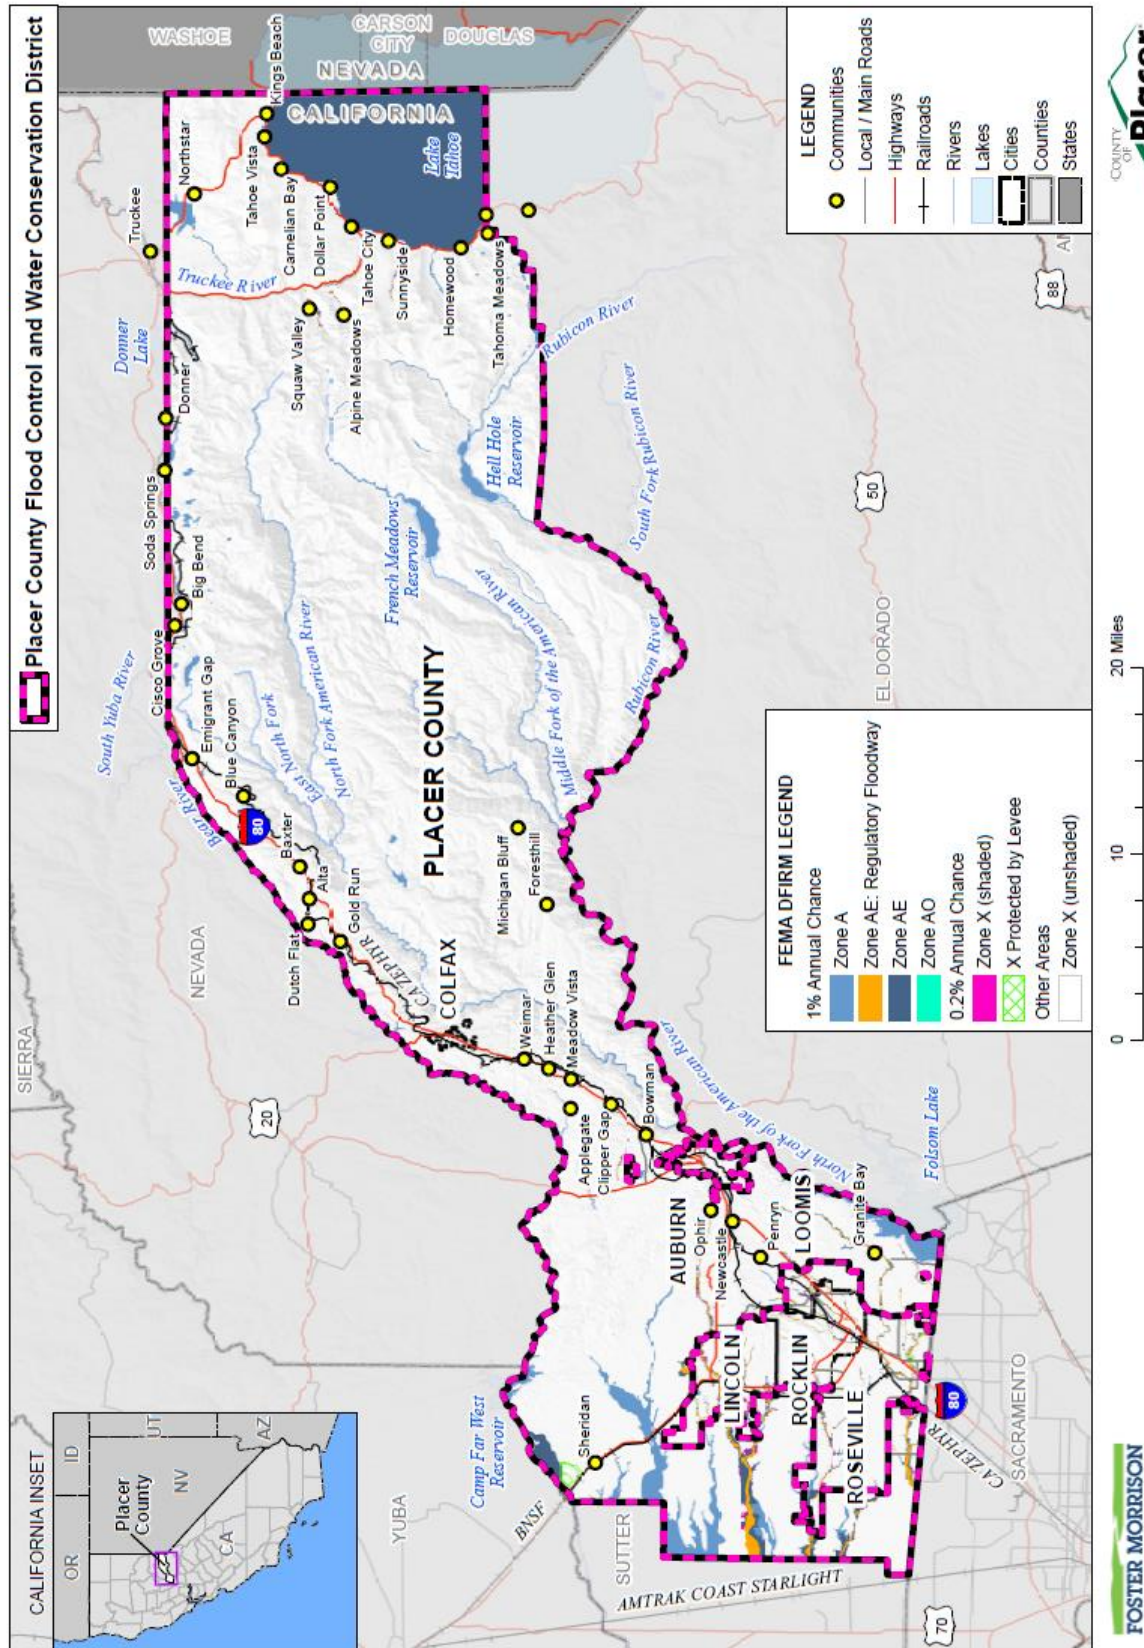

Hazard Profile and Problem Description

This hazard analyzes the FEMA DFIRM 1% and 0.2% annual chance floods. These tend to be the larger floods that can occur in the County or in the District, and have caused damages in the past. Flooding is a significant problem in Placer County and the District. Historically, the District has been at risk to flooding primarily during the winter and spring months when river systems in the County swell with heavy rainfall and snowmelt runoff. Normally, storm floodwaters are kept within defined limits by a variety of storm drainage and flood control measures. Occasionally, extended heavy rains result in floodwaters that exceed normal high-water boundaries and cause damage. As previously described in Section 4.3.12 of the Base Plan, the Placer County Planning Area and the PCFCWCD have been subject to historical flooding.

Location and Extent

Since the PCFCWCD boundaries are the same as the County, the PCFCWCD has areas located in the 1% and 0.2% annual chance floodplain. This is seen in Figure P-4.

Figure P-4 PCFCWCD – FEMA DFIRM Flood Zones

Data Source: FEMA DFIRM 11/2/2018, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Table P-6 details the DFIRM mapped flood zones within the 1% annual chance flood zone as well as other flood zones located within the District.

Table P-6 PCFCWCD– DFIRM Flood Hazard Zones

Flood Zone	Description	Flood Zone Present in the District
A	Areas subject to inundation by the 1% annual-chance flood event generally determined using approximate methodologies. Because detailed hydraulic analyses have not been performed, no Base Flood Elevations (BFEs) or flood depths are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE – Regulatory Floodway	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply. Different from AE in that it adds the water course and adjacent lands that must be reserved in order to discharge the base flood without increasing the water surface elevation by more than one foot.	X
AH	An area inundated by 1% annual chance flooding (usually an area of ponding), for which BFEs have been determined; flood depths range from 1 to 3 feet	X
AO	Areas subject to inundation by 100-year shallow flooding (usually sheet flow on sloping terrain) where average depths are between one and three feet	X
Shaded X	500-year flood the areas between the limits of the 1% annual chance flood and the 0.2-percent-annual-chance (or 500-year) flood	X
X Protected by Levee	An area determined to be outside the 500-year flood and protected by levee from 100-year flood	X
X	Areas outside of known floodplains.	X

Source: FEMA

Additionally, flood extents can generally be measured in volume, velocity, and depths of flooding. Expected flood depths in the District vary, depending on the nature and extent of a flood event; specific depths are unknown. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Flooding in the District tends to have a shorter speed of onset, due to the amount of water that flows through the District.

Flooding due to heavy rains and snow runoff has been a historical problem in the Placer County Planning Area. Abundant snowfall in the mountains combined with rain and steep terrain can mean rapid runoff and

flooding in the mountainous eastern section of the County. Of particular concern in this area of the County are rain-on-snow type events producing high runoff volumes. In the more heavily populated western portion of the County, flooding is often the result of heavy rains over lower permeability soils found within the relatively large Dry Creek and Cross Canal watersheds. Many of the small creeks within these watersheds respond quickly to heavy rains in the winter season producing peak flood flows within relatively short time frames. The historical practice of development within or in close proximity to floodplains has resulted in frequent and repeated flood losses in specific areas.

Past Occurrences

A list of state and federal disaster declarations for Placer County from flooding is shown on Table P-7. These events also likely affected the District to some degree.

Table P-7 Placer County – State and Federal Disaster Declarations from Flood 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Flood (including heavy rains and storms)	16	1950, 1955, 1958 (twice), 1962, 1963, 1969, 1973, 1980, 1983, 1986, 1995 (twice), 1997, 2008, 2017	13	1955, 1958, 1962, 1964, 1969, 1983, 1986, 1995 (twice), 1997, 2006 (twice), 2017

Source: Cal OES, FEMA

Significant flooding events resulting in federal disaster declarations for Placer County occurred in 1986, 1995, and 1997, with the most substantial damages occurring within the Cross Canal, Dry Creek, and Truckee River watersheds. The primary impacts from flooding within the District boundaries include damage to roads, utilities, bridges; and flooding of homes, businesses and critical facilities. Road closures create difficulties in providing emergency services to areas cut off by flooding and limit the area’s ability to evacuate. 2017 saw significant flooding due to atmospheric river storms that occurred in January and February of that year. PCFCWCD staff helped staff the EOC and monitored the District’s flood warning system and ALERT gages. The 2017 event damaged the Morton Road culvert crossing over Canyon Creek that necessitated an emergency repair.

Vulnerability to and Impacts from Flood

Floods have been a part of the District’s historical past and will continue to be so in the future. During winter months, long periods of precipitation and the timing of that precipitation are critical in determining the threat of flood, and these characteristics further dictate the potential for widespread structural and property damages. Predominantly, the effects of flooding are generally confined to areas near the waterways of the County. As waterways grow in size from local drainages, so grows the threat of flood and dimensions of the threat. This threatens structures in the floodplain. Structures can also be damaged from trees falling as a result of water-saturated soils. Electrical power outages happen, and the interruption of power causes major problems. Loss of power is usually a precursor to closure of governmental offices and community businesses. Roads can be damaged and closed, causing safety and evacuation issues. People may be swept away in floodwaters, causing injuries or deaths.

Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits. Direct impacts, such as drowning, can be limited with adequate warning and public education about what to do during floods. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, loss of environmental resources, and economic impacts.

Joe Rogers Road area adjacent to Miners Ravine and Cross Canal watershed/structures, residences, and/or roads inundated with flood waters are the areas most impacted by flooding.

Assets at Risk

With respect to District-owned assets, areas subject to stormwater flooding are the biggest concern. District assets at the greatest risk include those listed in Table P-4.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Flooding occurs in areas other than the FEMA mapped 1% and 0.2% annual chance floodplains. Flooding may be from drainages not studied by FEMA, lack of or inadequate drainage infrastructure, or inadequate maintenance. Localized, stormwater flooding occurs throughout the County during the rainy season from November through April. Prolonged heavy rainfall contributes to a large volume of runoff resulting in high peak flows of moderate duration.

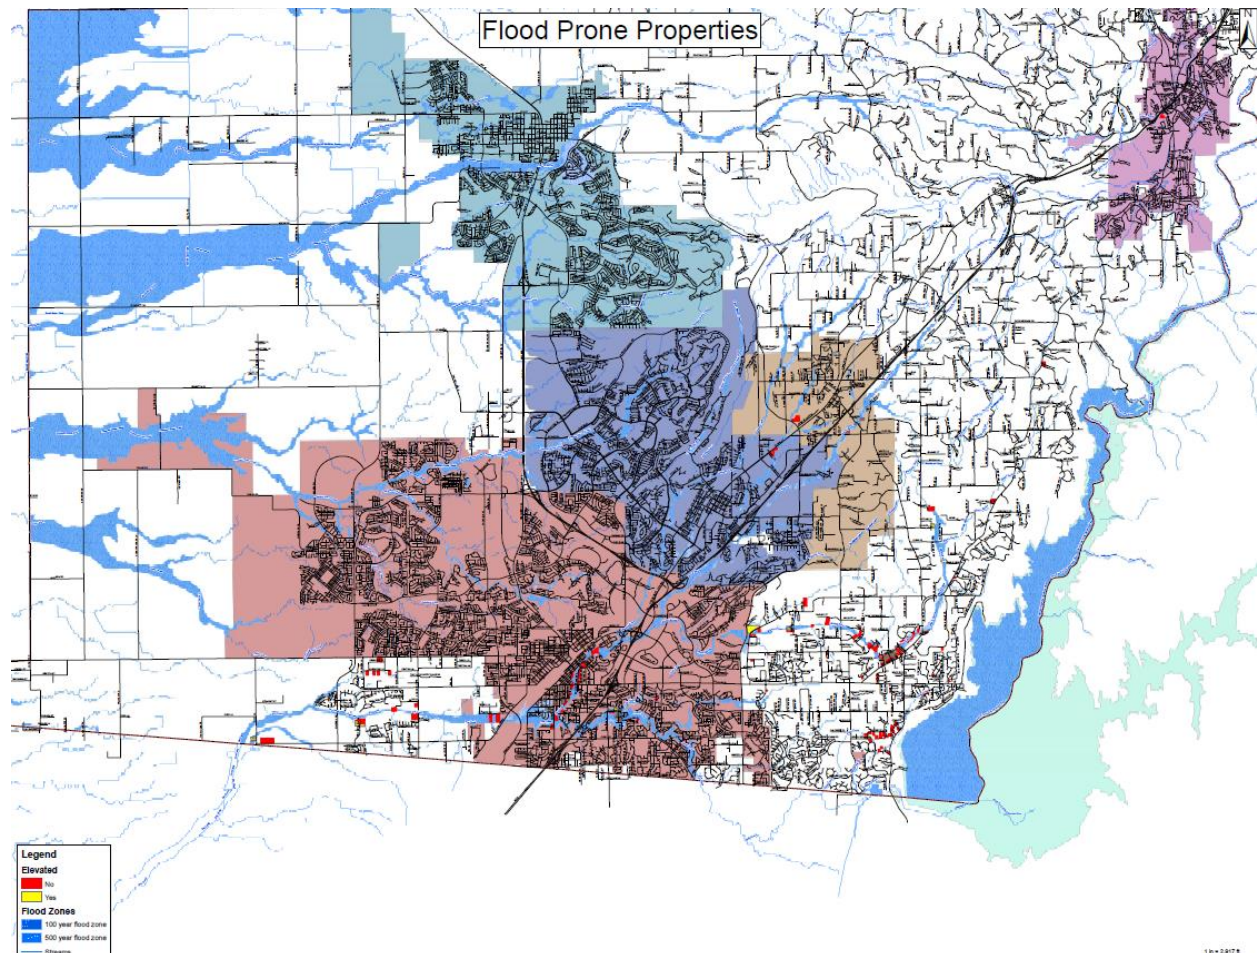

Location and Extent

The PCFCWCD is subject to localized flooding throughout the District. Flood extents are usually measured in areas affected, velocity of flooding, and depths of flooding. Expected flood depths in the District vary by location. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Localized flooding in the District tends to have a shorter speed of onset, especially when antecedent rainfall has soaked the ground and reduced its capacity to absorb additional moisture.

Past Occurrences

There have been no federal or state disaster declarations in the County due to localized flooding. The District has a map of flood prone properties. These are shown on Figure P-5.

Figure P-5 PCFCWCD – Flood Prone Properties

Source: PCFCWCD

The District noted the following past occurrences of localized flooding:

- Flooding within Western Placer County, Auburn, and the North Lake Tahoe area in 2017.

Vulnerability to and Impacts from Localized Flooding

Historically, much of the growth in the District and County has occurred adjacent to streams, resulting in significant damages to property, and losses from disruption of community activities when the streams overflow. Additional development in the watersheds of these streams affects both the frequency and duration of damaging floods through an increase in stormwater runoff.

Primary concerns associated with stormwater flooding include life safety issues, and impacts to property and to infrastructure that provides a means of ingress and egress throughout the community. Ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Objects can also be buried or destroyed through sediment deposition. Floodwaters can break utility lines and interrupt services. Standing water can cause damage to crops, roads, and foundations.

Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

Impacts to the District include damage to ALERT flood warning system gages and Miners Ravine Off-Channel Detention Facility.

Assets at Risk

The District noted that the flood warning system stream and rain gages, Miners Ravine Off-Channel Detention Basin Facility and Dam are most at risk from this hazard.

Levee Failure

Likelihood of Future Occurrence–Unlikely

Vulnerability–Medium

Hazard Profile and Problem Description

A levee is a raised area that runs along the banks of a stream or canal. Levees reinforce the banks and help prevent flooding by containing higher flow events to the main stream channel. By confining the flow to a narrower stream channel, levees can also increase the speed of the water. Levees can be natural or man-made.

Levees provide strong flood protection, but they are not failsafe. Levees are designed to protect against a specific flood level and could be overtopped during severe weather events or dam failure. For example, levees can be certified to provide protection against the 1% annual chance flood. Levees reduce, not eliminate, the risk to individuals and structures located behind them. A levee system failure or overtopping can create severe flooding and high water velocities. Levee failure can occur through overtopping or from seepage issues resulting from burrowing rodents, general erosion, excessive vegetation and root systems and other factors that compromise the integrity of the levee. No levee provides protection from events for which it was not designed, and proper operation and maintenance are necessary to reduce the probability of failure.

Location and Extent

There is not a scientific scale or measurement system in place for levee failure. Expected flood depths from a levee failure in the District vary by event and location. The speed of onset is slow as the river rises, but if a levee fails the warning times are generally short for those in the inundation area. The duration of levee failure risk times can be hours to weeks, depending on the river flows that the levee holds back. When northern California dams and reservoirs are nearing maximum capacity, they release water through the river systems, causing additional burdens on County levees. Levees in the District were shown in Section 4.3.15 of the Base Plan.

Past Occurrences

There have been no federal or state disaster declarations from levee failure. The District Planning Team noted no past occurrences of levee failures.

Vulnerability to and Impacts from Levee Failure

A levee failure can range from a small, uncontrolled release to a catastrophic failure. Levee failure flooding can occur as the result of prolonged rainfall and flooding. The primary danger associated with levee failure is the high velocity flooding of those properties outside and downstream of the breach.

Should a levee fail, some or all of the area protected by the levees would be at risk to flooding. Impacts from a levee failure include property damage, critical facility damage, and life safety issues. Business and economic losses could be large as facilities could be flooded and services interrupted. School and road closures could occur. Road closures would impede both evacuation routes and ability of first responders to quickly respond to calls for aid. Other problems connected with levee failure flooding include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

Assets at Risk

No District assets (from Table P-4) are at risk from this hazard.

Severe Weather: Heavy Rains and Storms (Hail, Lightning)

Likelihood of Future Occurrence—Highly Likely

Vulnerability—Medium

Hazard Profile and Problem Description

Storms in the District occur annually and are generally characterized by heavy rain often accompanied by strong winds and sometimes lightning and hail. Approximately 10 percent of the thunderstorms that occur each year in the United States are classified as severe. A thunderstorm is classified as severe when it contains one or more of the following phenomena: hail that is three-quarters of an inch or greater, winds in excess of 50 knots (57.5 mph), or a tornado. Heavy precipitation in the District falls mainly in the fall, winter, and spring months.

Location and Extent

Heavy rain events occur on a regional basis. Rains and storms can occur in any location of the District. All portions of the District are at risk to heavy rains. Most of the severe rains occur during the fall, winter, and spring months. There is no scale by which heavy rains and severe storms are measured. Magnitude of storms is measured often in rainfall and damages. The speed of onset of heavy rains can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of severe storms in California, Placer County, and the District can range from minutes to hours to days. Information on precipitation extremes can be found in Section 4.3.4 of the Base Plan.

Past Occurrences

There have been past disaster declarations from heavy rains and storms, which were discussed in Past Occurrences of the flood section above. According to historical hazard data, severe weather, including heavy rains and storms, is an annual occurrence in the District. This is the cause of many of the federal disaster declarations related to flooding.

Significant events include the heavy rains occurring during December 2005 into January 2006. An estimated 2-year rain event in January 2008 resulted in approximately \$14,000 worth of hillside erosion and drainage repairs at the District's Miners Ravine Off-Channel Detention Basin Facility.

Vulnerability to and Impacts from Heavy Rain and Storms

Heavy rain and severe storms are the most frequent type of severe weather occurrences in the District. These events can cause localized flooding. Elongated events, or events that occur during times where the ground is already saturated can cause 1% and 0.2% annual chance flooding. Wind often accompanies these storms and has caused damage in the past. Hail and lightning are rare in the District.

Actual damage associated with the effects of severe weather include impacts to property, critical facilities (such as utilities), and life safety. Heavy rains and storms often result in localized flooding creating significant issues. Roads can become impassable and ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Floodwaters and downed trees can break utilities and interrupt services.

During periods of heavy rains and storms, power outages can occur. These power outages can affect pumping stations and lift stations that help alleviate flooding. More information on power shortage and failure can be found in Section 4.3.2 of the Base Plan.

District specific concerns is damage to ALERT flood warning system gages and Miners Ravine Off-Channel Detention Facility.

Assets at Risk

With respect to District-owned assets, areas subject to stormwater flooding caused by heavy rains and storms are the biggest concern. District assets at the greatest risk include those listed in Table P-4.

Wildfire

Likelihood of Future Occurrence—Highly Likely
Vulnerability—

Hazard Profile and Problem Description

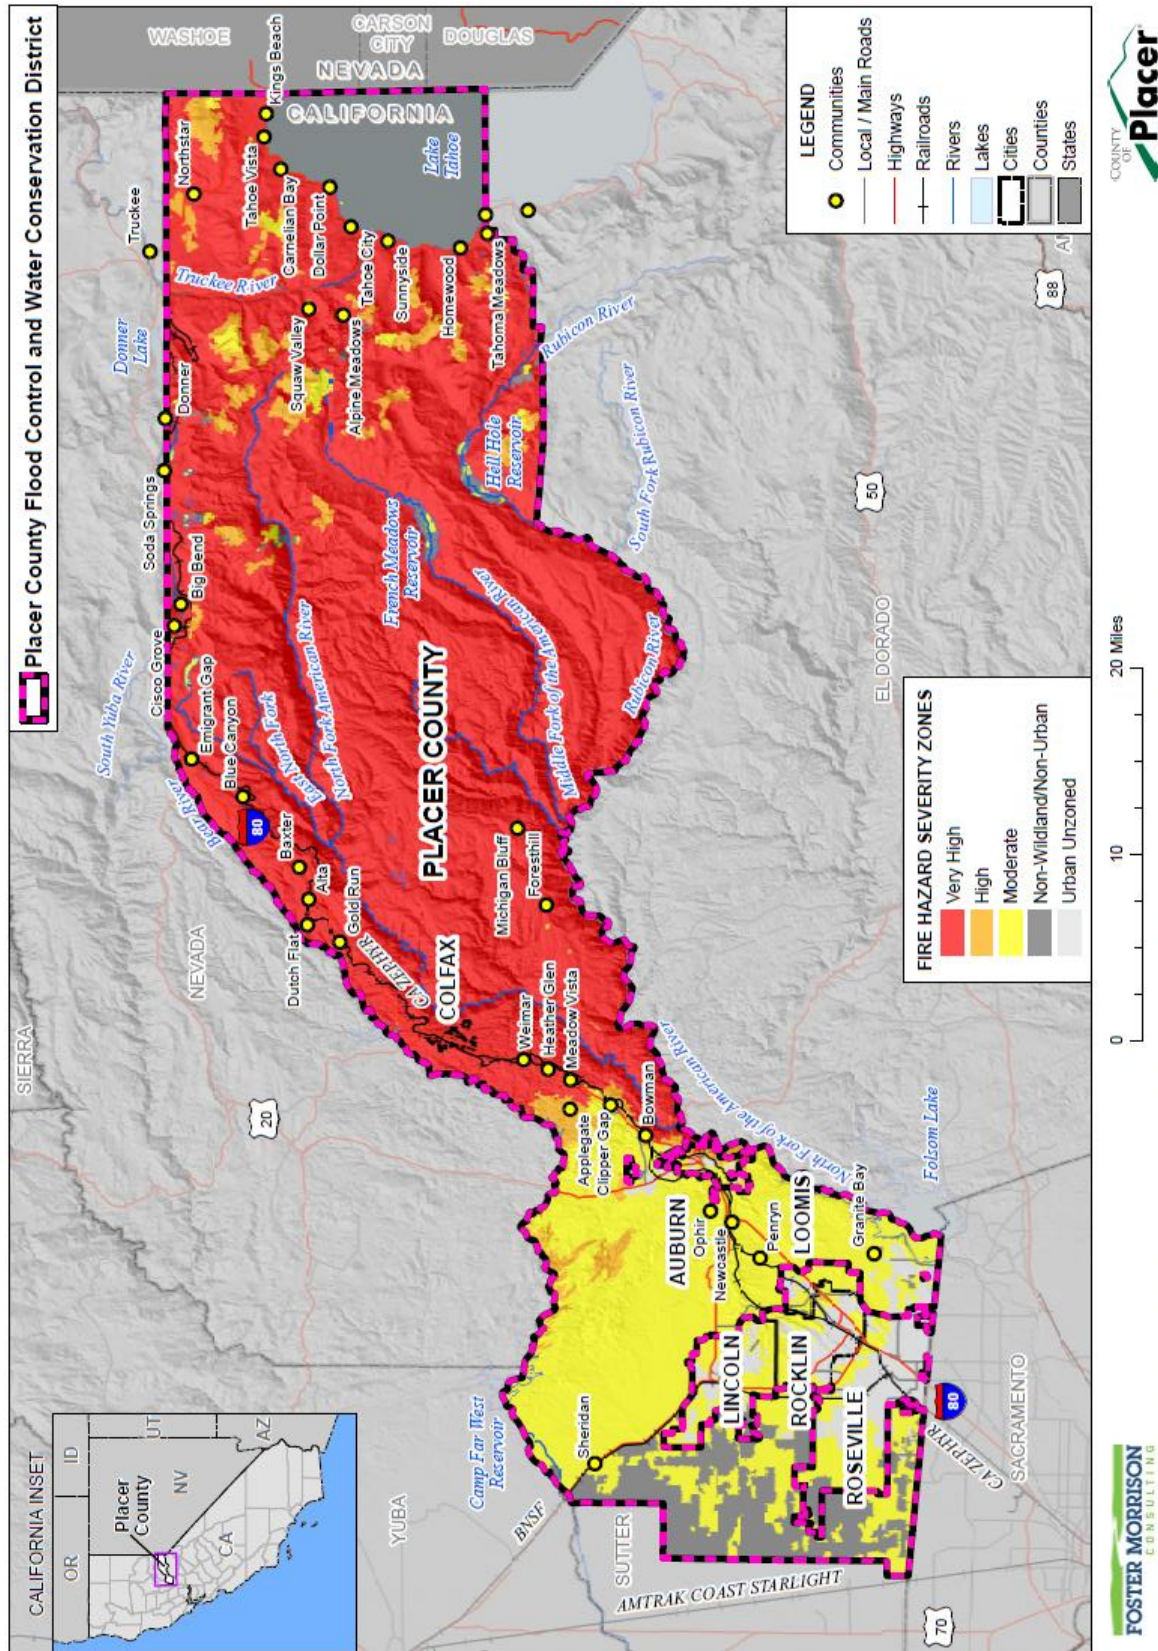

Wildland fire and the risk of a conflagration is an ongoing concern for the PCFCWCD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the

ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the PCFCWCD were created. Figure P-6 shows the CAL FIRE FHSZ in the District. As shown on the maps, fire hazard severity zones within the District range from urban unzoned to high.

Figure P-6 PCFCWCD – Fire Hazard Severity Zones

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table P-8.

Table P-8 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

Any smoke/air quality issues that coincided with operation and maintenance of the ALERT flood warning system that typically occurs in October and November of each year. Poor air quality makes it difficult for District and contractor staff to perform operations and maintenance.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater

services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

The District is concerned about damage to ALERT flood warning system gages and Miners Ravine Off-Channel Detention Facility. Debris flows in waterways following a wildfire can create culvert and bridge blockage causing damage to County road infrastructure.

Assets at Risk

Those Agency assets at greatest risk to wildland fire include the ALERT system of stream and rain gages listed in Table P-4.

P.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

P.6.1. Regulatory Mitigation Capabilities

Table P-9 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the PCFCWCD.

Table P-9 PCFCWCD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	N/A	N/A
Capital Improvements Plan	Y	Annual Short-term and 5-year Long-Term Work Plans; used to implement mitigation actions
Economic Development Plan	N/A	N/A
Local Emergency Operations Plan	Y	Annual updates to District's Flood Response Handbook; not used to implement mitigation actions
Continuity of Operations Plan	Y	Annual District Timeline of Operations
Transportation Plan	N/A	N/A

Stormwater Management Plan/Program	Y, 1990	District's Stormwater Management Manual (SWMM) and Amendments
Engineering Studies for Streams	Y, Varies	2011 Updated Dry Creek Watershed Flood Control Plan, 1992 Auburn Bowman Community Plan Hydrology Study, 1994 Placer/Sutter County Joint Study Auburn Ravine, Raccoon and Pleasant Grove Creeks
Community Wildfire Protection Plan	N/A	N/A
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N/A	N/A
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	N/A	Version/Year: N/A
Building Code Effectiveness Grading Schedule (BCEGS) Score	N/A	Score: N/A
Fire department ISO rating:	N/A	Rating: N/A
Site plan review requirements	N/A	N/A
		Is the ordinance an effective measure for reducing hazard impacts?
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	N/A	See Placer County Requirements
Subdivision ordinance	N/A	See Placer County Requirements
Floodplain ordinance	N/A	See Placer County Requirements
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N/A	See Placer County Requirements
Flood insurance rate maps	N/A	See Placer County Requirements
Elevation Certificates	N/A	See Placer County Requirements
Acquisition of land for open space and public recreation uses	N/A	See Placer County Requirements
Erosion or sediment control program	N/A	See Placer County Requirements
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District is pursuing updates to outdated stream engineering studies such as for the entire Cross Canal watershed. This includes Auburn Ravine, Raccoon Creek, and Pleasant Grove Creek in addition to Curry Creek and Markham Ravine. These watershed study updates allow for the for the detailed evaluation of regional flood control and other mitigation projects along with the impacts and needed mitigation for development. The future update to the Stormwater Management Manual will help the District and agencies within Placer County better define engineering design standards.		

Source: PCFCWCD

As indicated above, the District has several programs, plans, policies, codes and ordinances in place. These include regional watershed wide flood control plans and a county-wide stormwater management manual. The District, working cooperatively with Placer County and other local agencies, developed three major flood control plans in the early 1990's which cover a majority of the watersheds within western Placer

County. In addition to the Plans listed below the District maintains and references a number of detailed local drainage studies from its library.

FEMA Floodplain Mapping

The Flood Control and Water Conservation District is collaborating with FEMA through the Cooperating Technical Partners (CTP) Program in order to maintain up-to-date floodplain mapping and other flood hazard information within Placer County. The main objective of the program is to provide new or improved 1 percent annual chance floodplain, or 100-year, mapping of major creeks within developing areas of the County. Through three CTP efforts, over 120 miles of new or updated mapping will be provided in urbanized areas of the County. The creeks to be studied were prioritized through the District Technical Advisory Committee (TAC) consisting of member agency staff that identified the need for new or updated areas of floodplain mapping.

The District often leads the initial hydrologic studies which serve as the basis for the updated or new mapping produced separately by FEMA's mapping contractors. District staff have been providing regular updates regarding the CTP process to the District Board and cooperating member agencies at public Board of Director meetings. Placer County is the first jurisdiction to receive the new FEMA Digital Flood Insurance Rate Map (DFIRM) format which replaces the current paper map format. The DFIRMs are being released simultaneous to the CTP mapping studies depicting the new or updated 1 percent annual chance floodplain.

Areas being studied for remapping include:

- Western Placer County
- Lake Tahoe Area

Stormwater Management Manual

For policy, guidelines, specific design criteria for the development and management of natural resources, drainage facilities, and infrastructure for stormwater management please download the current version of the Placer County Flood Control & Water Conservation District Stormwater Management Manual (SWMM) (a link to our SWMM is on the District's website page at www.placer.ca.gov). There is currently a planned update to the SWMM to meet Senate Bill 5 and Urban Level of Flood Protection (ULOP) requirements, amongst other necessary updates.

Dry Creek Watershed Flood Control Plan

The purpose of the 1992 Dry Creek Watershed Flood Control Plan is to provide the District and other governmental agencies in both Placer and Sacramento Counties with the information and policies necessary to manage flood waters within the Dry Creek Watershed, which includes Miners Ravine, Linda Creek, Secret Ravine, Antelope Creek, Cirby Creek, and Dry Creek. The Plan evaluates existing flooding problems and identifies flood management options as well as a funding mechanism to achieve Plan recommendations. The plan was first drafted in 1992 and updated for re-publication in 2011. This plan may be found on the District's website.

Placer/Sutter County Joint Flood Study Auburn Ravine, Coon and Pleasant Grove Creeks (Cross Canal Watershed Flood Control Plan)

The purpose of the 1994 Cross Canal Watershed Flood Control Plan is to provide the District and other governmental agencies in both Placer and Sacramento Counties with the information and policies necessary to manage flood waters within the Cross Canal Watershed, which includes Pleasant Grove, Auburn Ravine, Markham Ravine, and Raccoon Creek. The Plan evaluates existing flooding problems and identifies flood management options as well as a funding mechanism to achieve Plan recommendations.

Auburn/Bowman Community Plan Hydrology Study

The purpose of the 1992 Auburn Bowman Community Plan Hydrology Study is to provide the District and other governmental agencies in Placer County with the information and policies necessary to manage flood waters within the study area, which includes Auburn Ravine, Mormon Ravine, Dutch Ravine, and many other tributaries. The Plan evaluates existing flooding problems and identifies flood management options as well as a funding mechanism to achieve Plan recommendations.

Antelope Creek Flood Control Project

The District is working on a regional flood control project, which includes the addition of two fish-friendly, on-channel weirs across Antelope Creek. The first weir or "Upper Weir" was completed in February 2018. The District is seeking grant funding to complete the second "Lower Weir". Features of this project include:

- Slight increase to the footprint of the existing FEMA recognized 100-year floodplain limits
- Provides substantial mitigation for increases in urban runoff and peak flood flow increases due to new and existing development in the watershed
- Provides as much as 800 cubic feet per second of 100-year peak flow decrease in downtown Roseville
- Includes stream channel and habitat restoration components
- Includes removal of non-native plants and re-planting with natives
- Includes improved public access and educational opportunities for the public along the existing multi-use recreational trail
- Funded through grants from the State Department of Water Resources (DWR), Proposition 84 IRWM program, the DWR Urban Streams Restoration Program and watershed mitigation fees collected within the Dry Creek Trust Fund

Countywide Grading Ordinance, 2000

A countywide grading ordinance was completed in 1988. It has since been adopted by the County and cities and last updated in 2000 as Article 15.48 of the County Code.

Placer County Flood Damage Prevention Regulations

Placer County has adopted Flood Damage Prevention Regulations, Article 15.52 of the County Code, which have as its purpose “to promote public health, safety and general welfare, and to minimize public and private losses due to flood conditions in specific areas.” The regulations provide specific construction and development standards for flood hazard reduction in areas of special flood hazard.

Flood Response Handbook with Flood Hazard Awareness Maps

The District, in conjunction with its member agencies, has developed a Flood Response Handbook (FRH) that includes Flood Hazard Awareness Maps of the unincorporated area and all cities. The FRH details roles, responsibilities, and processes for responding to a flood event.

Flood Hazard Awareness Maps (FHAM) have been created by the District for the purposes of identifying areas of the western County where flood hazards from local creeks are known to exist. The maps delineate the established FEMA 100-year and 500-year floodplains (where established) including a 250 foot setback limit from the 100-year floodplain. The setback limit was selected to assist emergency responders and planners in identifying local flood hazard areas, but is not a regulatory limit. Critical emergency response facilities including police and fire stations are shown as are other facilities which may be useful during a flooding event including hospitals, schools, churches and miscellaneous public facilities. Street crossings potentially impacted by flooding are also highlighted in red and the locations of sand bags for flood fighting purposes are also shown. The District intends to update these maps periodically as new information becomes available.

Placer County Flood Prone Map

The District and its member agencies have developed a database and GIS mapping of both residential and commercial structures that are subject to damage from repeat flooding events. The database on these properties has been developed over the years beginning with the 1986 flood event and is helpful in identifying these properties and general flood hazard areas. The database includes information (where available and recorded) on high water, finished floor elevations, previous flooding impact, and whether or not the structure had been elevated or not through a FEMA sponsored HMGP grant program. A GIS based mapping of these flood prone properties has been created and is color coded to indicate structures that have already been elevated versus those that have not. The mapping is useful in identifying flood hazard areas where it can be expected that most of the flood fighting and emergency response efforts will be focused. It is also useful in planning future flood mitigation strategies, elevation projects and regional flood control projects.

Flood Response Handbook

The District has also created, and annually updates its own Flood Response Handbook (FRH). The FRH addresses emergency communication procedures, emergency material supplies and equipment availability, technical resources, and data to help predict flooding events, and State level emergency operations manuals. The FRH also contains countywide GIS based Flood Hazard Awareness Mapping including areas of known flooding, locations of critical facilities such as police and fire stations, government centers, schools, nursing homes, and hospitals. Roads subject to flooding closures and preferred evacuation routes are also identified. This mapping is also posted at the County's Emergency Operations Center (EOC) and distributed to our member agencies.

P.6.2. Administrative/Technical Mitigation Capabilities

The District is governed by a nine-person board of directors. Members include a representative from each of the six incorporated cities in Placer County, two representatives from the Board of Supervisors and one member-at-large appointed by the Board of Supervisors.

The Cities, the County and the District have adopted a formal coordination agreement to identify responsibilities. There are two District Advisory Committees. The Policy Advisory Committee (PAC) has seven voting members - the six city managers of the incorporated cities and the County Executive Officer. The PAC provides guidance on policy and program issues that affect all jurisdictions. The Technical Advisory Committee (TAC) is composed of representatives of Placer County, incorporated cities, Placer County Resource Conservation District, Placer County Water Agency, Sacramento County Water Agency, Nevada Irrigation District, Sutter County Flood Control and Water Conservation District, and the Reclamation District 1001. The TAC is relied on for technical analysis and interpretation of ideas, policies, and programs.

The State legislation creating the District allows Placer County employees to act as District employees. There are three District staff members: the District Manager; the Development Coordinator; and the District Secretary. The Placer County Director of Public Works serves as the Executive Director of the District. Table P-10 identifies the District department(s) responsible for activities related to mitigation and loss prevention in PCFCWCD.

Table P-10 PCFCWCD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N/A	N/A
Mitigation Planning Committee	N/A	N/A
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	District staff manage the County's annual stream channel maintenance program
Mutual aid agreements	N/A	See Placer County Requirements
Other	Y	District Board of Directors and Technical Advisory Committee
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	N/A	Utilize resources of Placer County
Floodplain Administrator	N/A	Utilize resources of Placer County
Emergency Manager	N/A	Utilize resources of Placer County
Community Planner	N/A	Utilize resources of Placer County
Civil Engineer	Y	District Manager and Development Coordinator have Civil Engineering backgrounds with hazards and mitigation training. Staff coordinate effectively with other agencies within Placer County and utilize additional staff resources from Placer County

GIS Coordinator	N/A	Utilize resources of Placer County, Development Coordinator provides internal GIS support
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Everbridge flood warning system, ALERT system of precipitation and stream level gages
Hazard data and information	Y	District's Flood Response Handbook – Updated Annually
Grant writing	Y	District has received FEMA CTP grants, State DWR Prop 84 IRWM grants, DWR Flood Corridor Protection Program grant, DWR Flood Emergency Response Project grant, and DWR USRP grant
Hazus analysis	N	N/A
Other		
How can these capabilities be expanded and improved to reduce risk?		
Expansion and update of ALERT flood warning system will help to better monitor and respond to flood events. Continuing to pursue flood inundation forecasting software systems will allow for better flood emergency planning and response.		

Source: PCFCWCD

P.6.3. Fiscal Mitigation Capabilities

Table P-11 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table P-11 PCFCWCD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	District's General Fund
Authority to levy taxes for specific purposes	N	N/A
Fees for water, sewer, gas, or electric services		N/A
Impact fees for new development	Y	Dry Creek Trust Fund; used for regional flood control projects within the watershed
Storm water utility fee	N	N/A
Incur debt through general obligation bonds and/or special tax bonds	N	N/A
Incur debt through private activities	N	N/A
Community Development Block Grant	N	N/A
Other federal funding programs	Y	FEMA CTP program for floodplain mapping studies

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
State funding programs	Y	State DWR Prop 84 IRWM grants, DWR Flood Corridor Protection Program grant, DWR USRP grant, and DWR Flood Emergency Response Project grant
Other		
How can these capabilities be expanded and improved to reduce risk?		
The impact fees for new development can be expanded to develop new impact fees on development within the Cross Canal Watershed area. This could be used to fund regional flood control projects, which would reduce flooding risk. Continued pursuit of FEMA CTP grants will help reduce risk by identifying risks through updated and new floodplain mapping. Continued pursuit of State funding will help reduce risk through funding of additional flood control projects and flood warning system expansion and upgrades.		

Source: PCFCWCD

P.6.4. Mitigation Education, Outreach, and Partnerships

Table P-12 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table P-12 PCFCWCD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	American Basin Watershed Council; District staff attend monthly meetings
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N/A	Utilize resources of Placer County
Natural disaster or safety related school programs	N/A	Utilize resources of Placer County
StormReady certification	N/A	N/A
Firewise Communities certification	N/A	N/A
Public-private partnership initiatives addressing disaster-related issues	Y	FEMA Flood Mitigation Assistance Program (FMA) to assist with residential and commercial building elevation projects
Other		
How can these capabilities be expanded and improved to reduce risk?		
Public outreach can be continued through participation in local citizen groups and non-profit organizations. This will help to reduce risk through the active engagement of stakeholders to identify risks and hazards. Public educational efforts regarding the FMA can be expanded when there is additional interest in elevation projects. These projects provide mitigation by making structures more resilient to flood hazards.		

Source: PCFCWCD

The District boundaries are the boundaries of Placer County. District programs are accomplished through a cooperative effort involving Placer County and all of the municipalities in the County which include: the City of Auburn, City of Colfax, City of Lincoln, Town of Loomis, City of Rocklin, and City of Roseville. In addition, cooperative agreements have been established with Sacramento and Sutter Counties for addressing issues in commonly shared watersheds, and other governmental agencies, such as Reclamation District 1001, the Nevada Irrigation District, and the Placer County Water Agency who also participate in District programs.

The cities and County formally adopted a Coordination Agreement in February 1986, which was also reaffirmed with minor changes in 1997. The agreement identifies mutual responsibilities and established the Technical Advisory Committee and the Policy Advisory Committee as forums for formulating standards, policies, and programs to be recommended to the Board of Directors.

P.6.5. Other Mitigation Efforts

The District is involved in a variety of mitigation activities including public outreach and project activities. These mitigation activities include:

- Provides information and support to the public on flood and drought related issues
- Collects and interprets data from a network of stream and precipitation gages operated by the District and others
- Collects data and coordinates with the National Weather Service
- Performs annual stream maintenance on the Dry Creek Watershed
- Provides technical support to the cities, county, and private sector by reviewing plans for public and private lands and for policy issues in flood control, drainage, and related areas
- Develops and implement master plans for key watersheds
- Supports regional floodplain management, including coordination with the NFIP
- Participates on special flood control and drainage projects.

Specific accomplishments of the District since the 2005 LHMP include:

2004: Land acquisition is completed for the 26 acre Miners Ravine off-channel basin project in Roseville. Major consulting contract for the Miners Ravine off-channel basin facility including planning, permitting, design, and construction oversight is awarded and begun. Land acquisition negotiations begin for proposed Secret Ravine floodplain restoration site in Rocklin. A study of remaining alternative regional detention sites in the Dry Creek Watershed is completed with no viable sites found. ALERT system software upgrades and three new gage installations are completed. An electronic version of the District's Stormwater Management Manual (SWMM) as well as Board meeting agenda/minutes are posted to the web. Biennial audit is completed. Work on development of the County's Local Hazard Mitigation Plan per the Disaster Mitigation Act of 2000 is completed.

2005: The District is awarded \$300,000 from the State Department of Water Resources under the Urban Streams Restoration Program and the District procures a consultant to perform planning, design, permitting, and construction oversight of the Secret Ravine floodplain restoration project. A new five-year MOU with the Department of Fish and Game is finalized for continued Dry Creek watershed stream channel maintenance activities. Planning and design of the Miners Ravine off-channel detention basin project

reaches a 95 percent level of completion. An update of the District's Flood Response Handbook is completed and distributed.

2006: District staff respond to the New Year's Day flooding event by helping activate the County's emergency operation center and by providing technical assistance as necessary. The Board approves all CEQA related documents and construction bid documents for the Miners Ravine Off-Channel Detention Basin Facility. Construction bids are received, all necessary permits are obtained, a construction contract is awarded, and construction commences on the Miners Ravine Facility in August. Construction reaches an approximate 70 percent completion level prior to winterization of the Miners Ravine site in early November. Planning and design of the Secret Ravine Floodplain restoration project begins and reaches an approximate 30 percent completion level by the end of the year. The District's ALERT flood warning software system is upgraded to the web-based Contrail system and plans are approved to install up to seven new gages.

2007: Construction of the Miners Ravine Off-Channel Detention Basin Facility is completed and the start of long-term operations and maintenance activities begins. A five year long vegetation and debris maintenance contract is executed with the California Conservation Corps (CCC) for the Miners Facility. The Secret Ravine Floodplain Restoration Project is placed on hold and an existing grant with the Department of Water Resources (DWR) is terminated due to easement acquisition difficulties and limited benefits of the proposed project. A \$2.8 million grant application for the Scilacci Farms Flood and Conservation Easement Project on Raccoon Creek is submitted to the DWR Flood Protection Corridor Program. Six new ALERT stream level and precipitation gages are purchased, installed and made operational within the District's ALERT system of gages. A professional services agreement is awarded to complete an update to the 1992 dated Dry Creek Watershed Flood Control Plan.

2008: Significant progress is made towards completing the update to the 1992 dated Dry Creek Watershed Flood Control Plan. The District's Miners Ravine Off-Channel Detention Basin Facility wins an award for engineering excellence and long term operations, maintenance, and monitoring activities continue at the facility. The Scilacci Farms Flood and Conservation Easement project is submitted to the State of California Department of Conservation grant program for consideration. FEMA coordinates with District to release results of 60 miles of creek study revisions and digitized floodplain mapping.

2010: The updated Dry Creek Watershed Flood Control Plan is released for public and agency review and presentations to our Board and the public are made. Coordinated with PCWA to submit a joint grant application under the State DWR Prop 84 IRWM program for the Antelope Creek Water Efficiency and Flood Control Project. Adopted the 2010 update to Placer County's Local Hazard Mitigation Plan. Coordinated with FEMA and our member agencies in the release and review of the Digital Flood Insurance Rate Maps (DFIRMS). Approved billing rates and methodology for reimbursement of all District staff time spent on development review submittals. Completed job classification studies of the District staff positions.

2011: The District receives a \$741,000 grant award under the State DWR Prop 84 IRWM program to assist with Phase 1 of the Antelope Creek Water Efficiency and Flood Control project and procures professional consulting services to assist with the project. The District Board accepts the 2011 Update to the Dry Creek Watershed Flood Control Plan as final and directs staff to move forward with the required financial nexus study and compliance under CEQA. The District receives a \$300,000 federal grant award through a FEMA

Cooperating Technical Partnership and begins detailed floodplain mapping studies of six creeks in Placer County. Major upgrades to the District's website are completed. The District updated the DCWS plan. It was finalized in 2011.

2012: The District begins work on the preliminary design, permitting and flood easements for the regional Antelope Creek Flood Control project. Considerable progress is made towards completion of a filing under CEQA and financial nexus studies for the 2011 Update to the Dry Creek Watershed Flood Control Plan. The District and its consultant make considerable progress towards completion of the FEMA Cooperating Technical Partnership project including detailed floodplain mapping studies of six creeks in Placer County. FEMA completes additional LIDAR topographic surveys for remaining portions of County. Staff provide information to member agencies regarding local legislative impacts of newly adopted State Department of Water Resources Central Valley Flood Protection Plan and Senate Bill 5 requirements.

2013: CEQA is completed for the Antelope Creek Flood Control Project and the project planning and design reaches a 65% level of completion. The City of Roseville and Placer County enter into a MOU to provide an additional \$400,000 of funding for this project. A major land acquisition for a flowage easement across private property is also executed for this project. The Board approves of the financial nexus study and revised fee structure recommended from the 2011 Updated Dry Creek Watershed Flood Control Plan. A second Cooperating Technical Partners agreement is entered into with FEMA wherein the District will provide specific duties during the public outreach phase and release of final floodplain mapping of six creeks in Placer County.

2014: Planning and design activities for the Antelope Creek Flood Control Project reach a 100% level of completion in advance of the start of construction anticipated in summer 2015. Required agency permit applications are submitted and additional required flowage easements on both private and publicly held lands are acquired. A grant application is prepared and submitted under the DWR Urban Streams Restoration Program for additional funding necessary to complete the construction of this project. All hydrologic modeling work on the first CTP agreement with FEMA is completed and preliminary floodplain mapping activities begin. A multi-agency Flood Emergency Response planning project gets underway including flood forecasting, flood inundation mapping and emergency response plan updates.

2015: Assisted affected member agencies with meeting the legislative requirements of the State Department of Water Resources new Urban Level of Flood Protection or ULOP (a 200-year protection standard) required by Senate Bill-5. Provided technical assistance during the development of Placer County's reverse 911 type public mass notification system utilized during flood events. Planning, design and permitting activities for the Antelope Creek Flood Control Project continued including processing of an amendment to the CEQA filing and finalizing the purchase of seven flowage easements from the City of Roseville. Final permitting and land acquisition activities associated with the Antelope Creek Flood Control Project continued but delayed the start of project construction until June 2016. FEMA produces preliminary FIRM maps for six new floodplain mapping studies of creeks in western and eastern Placer County. Work on the multi-agency Flood Emergency Response planning project continues including flood forecasting, flood inundation mapping and emergency response plan updates.

2016: Coordinated the public release of preliminary FEMA floodplain maps, including four public outreach meetings. Received a \$500,000 award from FEMA under the existing CTP agreement to restudy and map

an additional 50 miles of creeks within the County. Received a \$400,000 grant award from Department of Water Resources Urban Streams Restoration Program to be utilized towards the construction of the Antelope Creek Flood Control project. Obtained nearly all necessary agency permits and access agreements (excepting the Corps of Engineers 404 permit) necessary to go to construction bid for the Antelope Creek Flood Control project. Completed a 5-year update to our District's annex within the County's Local Hazard Mitigation Plan. Began the work of entering into a 12-year long Routine Maintenance Agreement with the State Department of Fish and Wildlife for permitting relating to the annual stream channel maintenance program. Continued planning and design efforts for an ALERT 2 type upgrade to the District's flood warning system of gages.

2017: Final permits and approvals to begin construction of the Antelope Creek Flood Control Project, Upper Weir were obtained in early 2017. The project went to bid and construction began in June 2017. Construction was substantially completed by the end of December 2017. Staff coordinated closely with FEMA and our local affected member agencies on floodplain mapping studies and the release of new digital FIRM maps under our existing Cooperative Technical Partnership (CTP) with FEMA. Work continued on efforts to enter into a 12-year long Routine Maintenance Agreement with the State Department of Fish and Wildlife for permitting relating to the annual stream channel maintenance program. Continued planning, design, and installation efforts for an ALERT 2 type upgrade to the District's flood warning system of gages.

2018: Construction of the Antelope Creek Flood Control Project, Upper Weir was accepted as complete on February 7, 2018. A professional consulting firm was procured and began work under a five-year agreement to provide long term mitigation, monitoring and reporting services for this project. The District was awarded a grant from the Department of Water Resources to act as the lead agency to complete the ALERT 2 type upgrades to our ALERT system of flood gages. Staff coordinated with the State Department of Fish and Wildlife to obtain a 12-year long Routine Maintenance Agreement to allow the County's annual stream channel maintenance program to continue. The District was awarded a third CTP grant from FEMA to perform floodplain mapping studies on an additional 60 miles of streams, a consultant was procured and work began on this new study. New floodplain maps produced under the second CTP project were presented to the public, finalized, and became effective on November 2, 2018.

2019: The District coordinated with the City of Roseville to complete the multi-year effort upgrading the District's ALERT flood warning system base station, software, and one gage location to ALERT 2 protocol. These upgrades were made possible through Round 2 of the Department of Water Resources Flood Emergency Response Project (FERP) Grant managed by the City of Roseville. Two new ALERT stream level and precipitation gages were also installed and made operational within the Districts ALERT system of gages as part of this project.

The Scilacci Farms Flood and Conservation Easement project is approved by the State of California Department of Conservation grant program and executed in January.

2020: The District submitted a Notice of Intent for a fourth CTP grant from FEMA to perform floodplain mapping studies on an additional 33 miles of streams. Coordinated the submittal of the floodplain mapping study information to FEMA for the third CTP grant project.

Annually - Stream Channel Maintenance Program - Placer County annually removes vegetation from selected creek channels to improve flood flows.

P.7 Mitigation Strategy

P.7.1. Mitigation Goals and Objectives

The PCFCWCD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

P.7.2. Mitigation Actions

The planning team for the PCFCWCD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Dam Failure
- Drought and Water Shortage
- Flood: 1%/0.2% Annual Chance
- Flood: Localized Stormwater Flooding
- Levee Failure
- Severe Weather: Heavy Rains and Storms
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

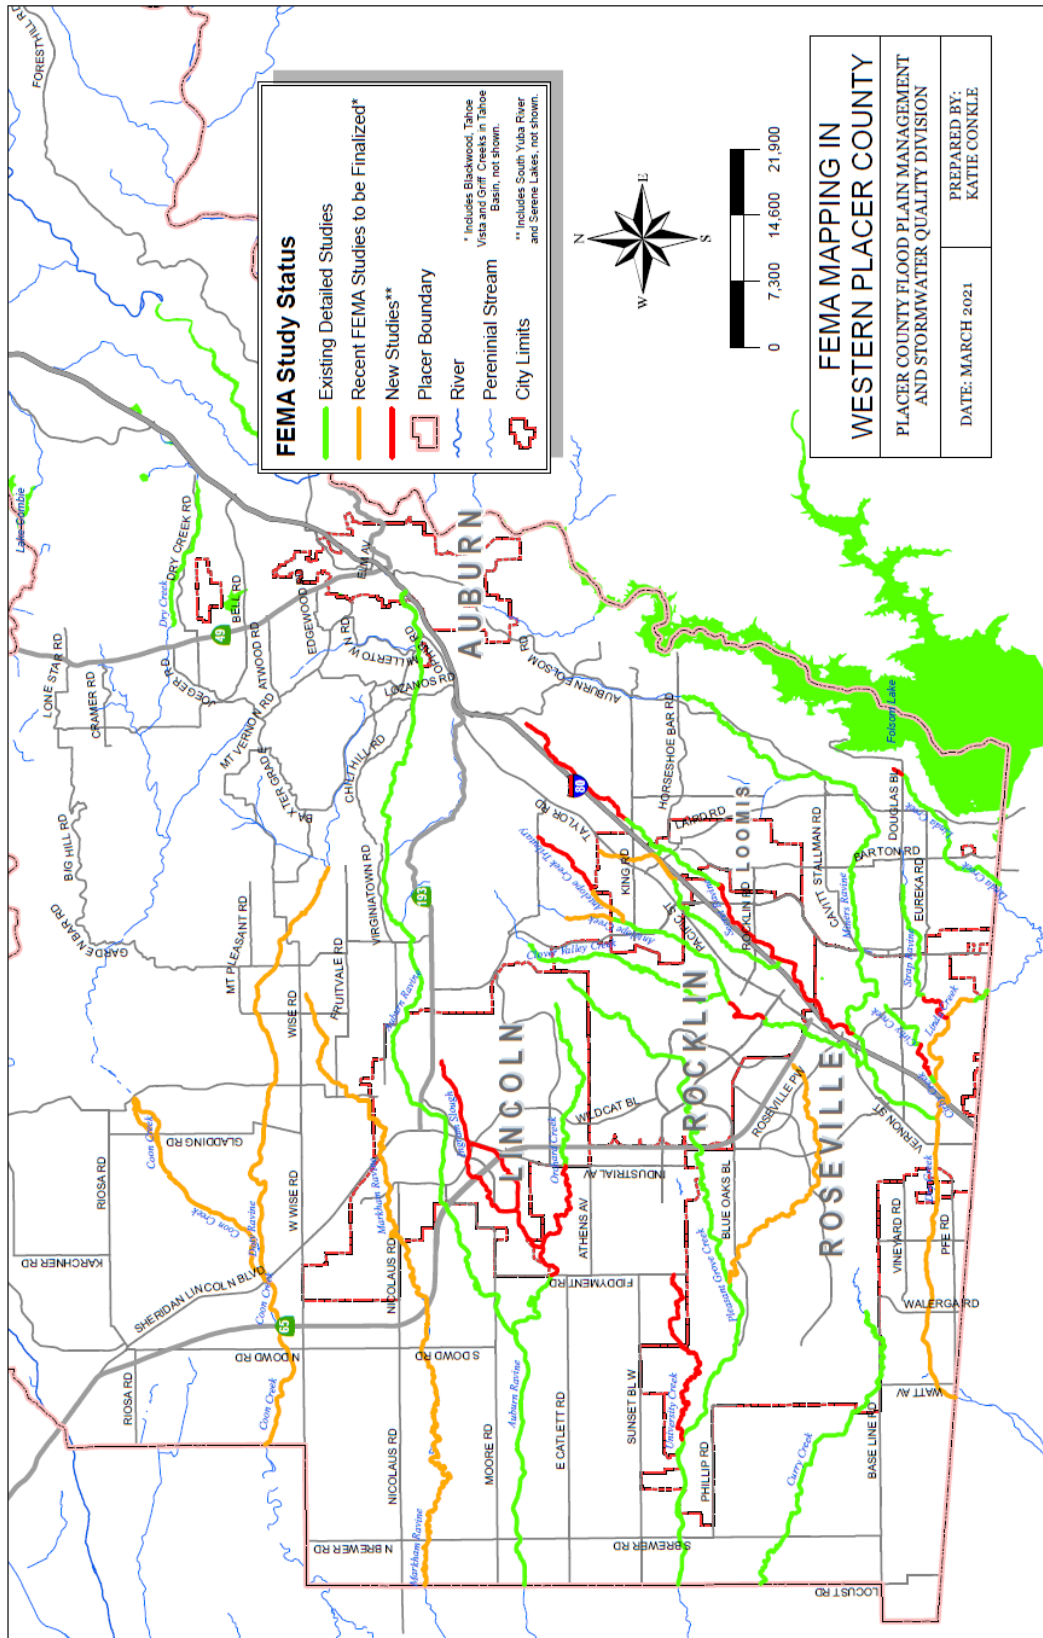

Action 1. FEMA CTP DFIRM Mapping Study

Hazard Addressed: Dam Failure, Flood, Localized Flooding, Levee Failure, Heavy Rains and Storms (indirectly would address drought and water shortage and wildfire, as drought can cause fire, which can cause flooding from the burn scar)

Goals Addressed: 1, 2, 3, 4, 5, 7

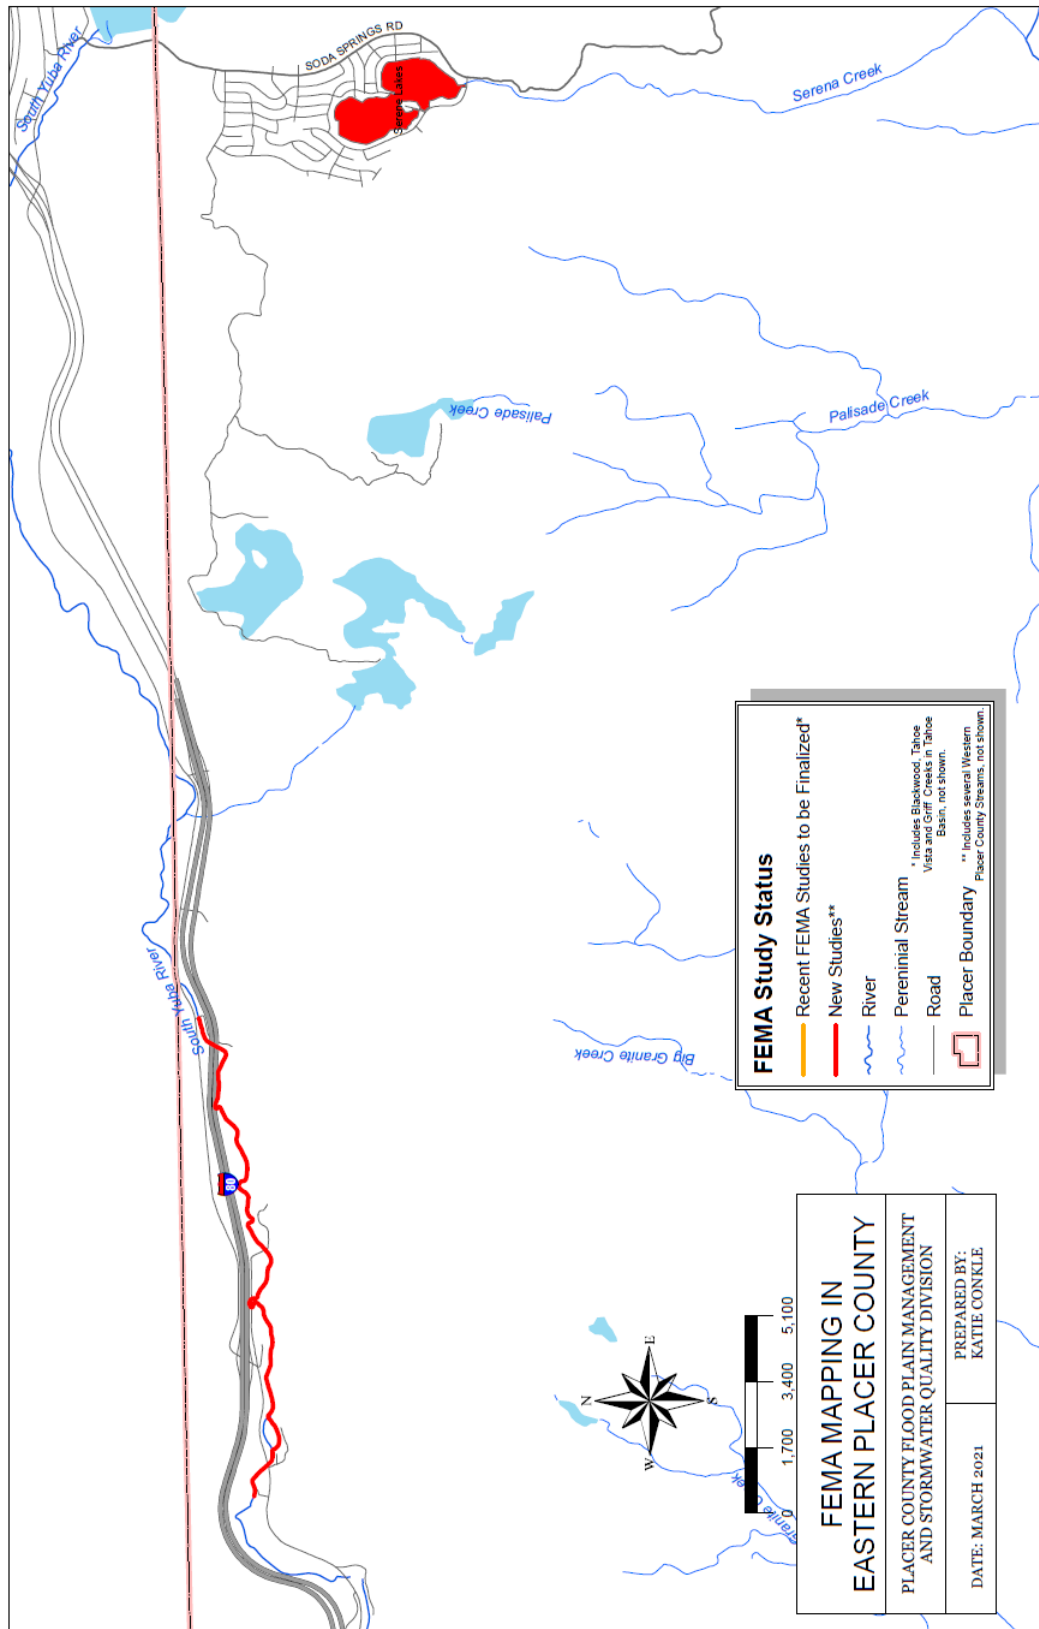

Issue/Background Statement: The Placer County Flood Control and Water Conservation District (District), coordinating closely with local member agencies, has prepared a list of additional study areas within Placer County recommended to be considered for the next round of Risk Map (CTP No. 4) floodplain mapping studies. Eleven areas were identified as priority stream limits, with consideration given to communities at flood risk, population growth, new development, peak flow increases, recent flooding history and changes to special flood hazard areas. A significant portion (approximately 15 miles) of the remaining un-mapped Zone A areas within the County, Roseville, and Lincoln was included in the request. The total length of proposed new study area, including all existing A and AE zone reaches amounts to approximately 33 miles. The map provided below depicts the FEMA FIRM mapping status and proposed new mapping/study reaches for Placer County. This effort would provide hydrologic modeling and data sufficient for FEMA's contractor to utilize this information to produce future updated DFIRM mapping. The proposed new mapping study areas are shown in Figure P-7 and Figure P-8.

Figure P-7 FEMA CTP Mapping – Western Placer County

Source: PCFCD

Figure P-8 FEMA CTP Mapping – Eastern Placer County

Source: PCFCD

Additional and more accurate DFIRM mapping of new study areas will enable the County to better manage their floodplains and reduce flood risk.

Other Alternatives: No action; maintain current mapping

Existing Planning Mechanisms through which Action Will be Implemented: FIS/DFIRM

Responsible Office: Placer County Flood Control District, FEMA

Priority (H, M, L): High

Cost Estimate: As a Cooperating Technical Partner, the District would be able to cost-share by providing in-kind professional labor services, existing hydrologic models, topographic field data (LIDAR), and other background information on the proposed study areas as has been done in the past.

Benefits (Losses Avoided): Increased understanding of flood risk in the County. Better mapping to prevent citizens from building in the floodplain and reducing resulting NFIP flood claims.

Potential Funding: FEMA CTP, District General Fund

Schedule: The CTP No. 3 preliminary mapping will be completed in 2021. Update of the physical DFIRM maps will occur several years later. The CTP No. 4 project is anticipated to begin in 2022.

Action 2. *Pursue Regional Detention and Retention Projects within the Dry Creek and Cross Canal Watersheds*

Hazard Addressed: Dam Failure, Flood, Localized Flooding, Levee Failure, Heavy Rains and Storms

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background Statement: Historically, flooding in the Dry Creek and Cross Canal watersheds has been a major concern. Placer County is not only concerned with existing flooding problems, but with future problems resulting from increased growth and development in the area. Specifically, this action recommends projects be pursued for regional detention and retention within the Dry Creek and Cross Canal watersheds. Implementation of the regional Antelope Creek Flood Control Project is currently the highest regional priority project for the District. This site was identified within the updated 2011 Dry Creek Watershed Flood Control Plan prepared for the District. The first phase of the Antelope Creek Flood Control Project (i.e., the upstream weir of two proposed) was completed in 2018. Implementation of regional detention and retention projects will reduce future flood-related losses. It is recommended the District continue to attempt to partner with Placer County regarding a possible regional retention project on the Scilacci Farms project in the Cross Canal watershed, along Raccoon Creek.

Other Alternatives: No action.

Existing Planning Mechanisms through which Action Will be Implemented:

Responsible Office: Placer County Flood Control and Water Conservation District, in conjunction with its member agencies.

Priority (H, M, L): High

Cost Estimate: \$20 million +

Benefits (Losses Avoided): Life safety; reduction in property loss.

Potential Funding: HGMP, PDM, Dry Creek Trust Fund, other grants (federal, state).

Schedule: Within ten years.

Action 3. Update the Flood Control Plan for the Cross Canal Watershed

Hazard Addressed: Dam Failure, Flood, Localized Flooding, Levee Failure, Heavy Rains and Storms

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background Statement: The flood control plan for the Cross Canal watersheds is outdated having been performed in 1993. Rapid urbanization within this watershed has occurred and is projected to continue with significant impacts to creeks within the watershed due to increasing amounts of impervious surfaces and altered land uses. Updated hydrology and hydraulic models are now available for most creeks within this watershed and can be referenced for both flood control and land use planning purposes.

Other Alternatives: Continue to review urbanization projects with outdated models.

Existing Planning Mechanisms through which Action Will be Implemented:

Responsible Office: Placer County Flood Control and Water Conservation District and its member agencies.

Priority (H, M, L): High

Cost Estimate: \$500,000

Benefits (Losses Avoided): Improved flood control and land use planning capabilities throughout western Placer County.

Potential Funding: Placer County Flood Control District reserves, PDM, State Planning Grants

Schedule: Immediate and ongoing.

Action 4. Upgrade Flood Warning System to ALERT 2, Add Additional Gage Locations and Flood Forecasting Capabilities

Hazard Addressed: Dam Failure, Flood, Localized Flooding, Levee Failure, Heavy Rains and Storms (indirectly would address drought and water shortage and wildfire, as drought can cause fire, which can cause flooding from the burn scar)

Issue/Background Statement: The Placer County Flood Control District, in conjunction with OES, has installed an ALERT flood warning system in the County consisting of 18 precipitation and stream level gages. The regional system, including ALERT gages owned and operated by the City of Roseville and Sacramento County, consists of approximately 102 rain gages and 84 stream gages. Additionally, the District monitors several rain and stream gages in the Truckee River Watershed. These ALERT gages provide the District with real-time rainfall amounts and stream level data. An upgraded system to include ALERT 2 type improvements, as well as real time flood warning gages and flood forecasting capabilities for flood-prone areas would increase the warning time for implementation of effective mitigation measures and necessary evacuations. The ALERT 2 type upgrades are being funded by the State DWR FERP program. The ALERT 2 base station improvements were implemented in 2019 with Round 2 of the FERP grant managed by the City of Roseville. The individual site upgrades will occur over the next two years under Round 3 of the FERP managed by the District.

Other Alternatives: No action – continue with current plan

Existing Planning Mechanisms through which Action Will be Implemented:

Responsible Office: Placer County Flood Control District and Placer County Office of Emergency Services

Priority (H, M, L): Medium

Cost Estimate: \$100,000

Benefits (Losses Avoided): Life-safety, reduction in property loss, improved warning, increased lead time.

Potential Funding: PDM, HGMP, District reserves.

Schedule: Within two years

Annex Q Placer County Resource Conservation District

Q.1 Introduction

This Annex details the hazard mitigation planning elements specific to Placer County Resource Conservation District (PCRCDD or District), a new participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to PCRCDD, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

Note: PCRCDD participated in the original 2005 Placer County LHMP. A copy of that document could not be located by PCRCDD, Placer County, or Cal OES. Additionally, staff turnover in the past 16 years has reduced institutional memory of that 2005 Plan. It can be assumed that none of PCRCDD's proposed mitigation actions were completed, PCRCDD's mitigation priorities at that time are unknown, and that the 2005 Plan was not incorporated into any PCRCDD planning mechanisms. Development in the District since 2005 was described by PCRCDD as minimal since the District owns no fixed assets, and a general description of more recent development in the District is included in Section Q.5.2 of this Annex.

Q.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table Q-1. Additional details on plan participation and District representatives are included in Appendix A.

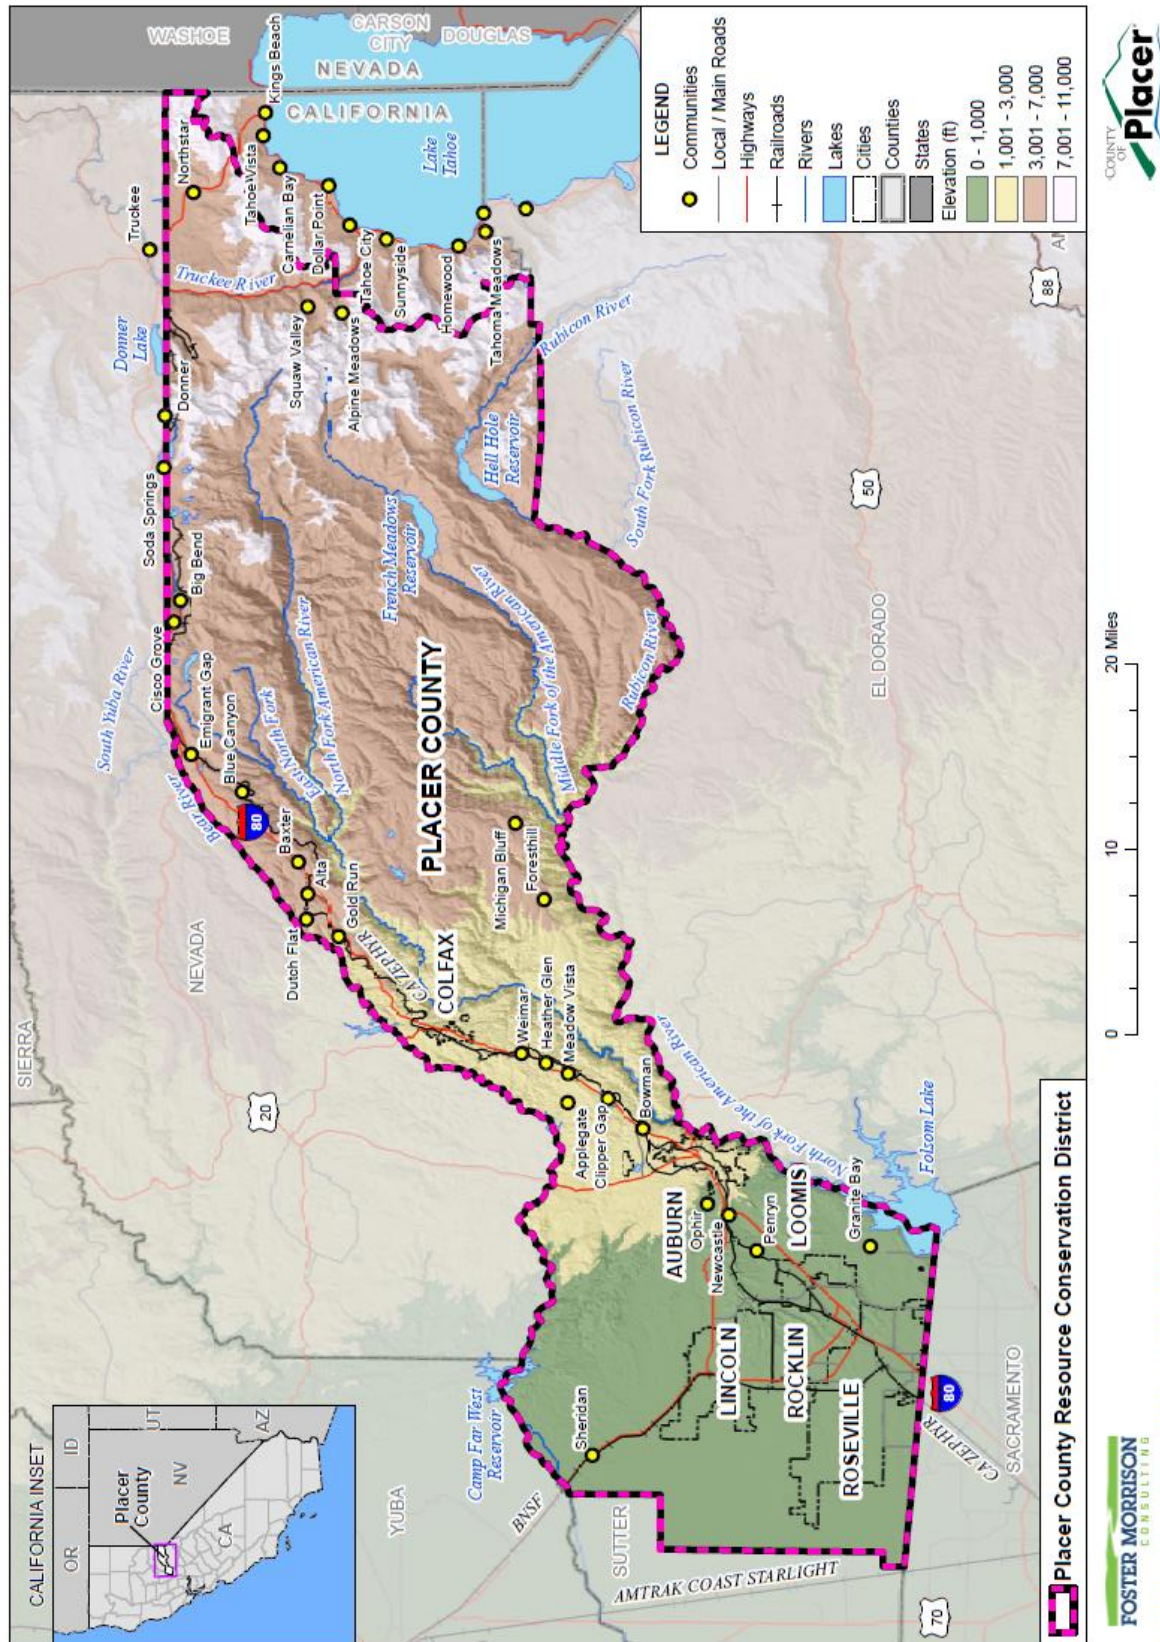

Table Q-1 PCRCDD – Planning Team

Name	Position/Title	How Participated
Sarah Jones	Executive Director	Participated in Placer County Hazard Mitigation Planning meetings, developed PCRCDD annex
George Alves	Program Administrator	Participated in Placer County Hazard Mitigation Planning meetings, provided input on PCRCDD annex

Q.3 District Profile

The District profile for the PCRCDD is detailed in the following sections. Figure Q-1 displays a map and the location of the District within Placer County.

Figure Q-1 PCRCD

Q.3.1. Overview and Background

The Placer County Resource Conservation District is an independent, self-governing body organized in 1946 and dedicated to the conservation of natural resources. The PRCD develops and enables programs in partnership with others that assist private landowners and public agencies to accomplish the goal of conserving natural resources. Our District develops, plans and implements programs, services and activities to effectively address current and emerging conservation and natural resource priorities in Placer County.

The RCD encompasses all of the County of Placer except for the Tahoe Basin and covers approximately 1,400 square miles of diverse stakeholders, habitat, and elevation, from the Sacramento Valley floor over the crest of the Sierra down the eastern slope to the Nevada State line.

District boundaries match Placer Counties other than the Tahoe Basin which falls under the Tahoe Resource Conservation District. The PRCD handles natural resource environmental work, so any environmental hazard that can be mitigated would fall under the District's purview – habitat restoration, forestry, wildfire, erosion control, invasive weeds, watershed health, stormwater etc.

The Placer RCD mission is dedicated to supporting wise natural resource management and conservation, providing education and technical assistance or direction to private landowners/operators, local and regional entities independently and in collaboration with other local, state, and federal agencies and organizations. The RCD implements plans, programs, holds land easements and endowments to conserve and enhance the natural resources of the District while inspiring and mobilizing public conservation awareness and involvement. Placer RCD shares many common natural resource management goals with Placer County and partners with them to achieve our mission. Our participation in the plan is imperative to achieve shared goals of natural resource conservation and preservation for lands in Placer County.

Q.4 Hazard Identification

PCRCD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table Q-2). It should be noted that the rankings here are the same as for Placer County as a whole, with the exception of seiche (which occurs outside the boundaries of the PCRCD).

Table Q-2 PCRC D—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Significant	Highly Likely	Critical	Medium	Medium
Avalanche	Limited	Likely	Limited	Low	Medium
Climate Change	Extensive	Likely	Limited	High	–
Dam Failure	Significant	Occasional	Critical	Low	Medium
Drought & Water Shortage	Extensive	Likely	Critical	Medium	High
Earthquake	Significant	Occasional	Critical	Low	Low
Floods: 1%/0.2% annual chance	Limited	Occasional	Critical	Low	Medium
Floods: Localized Stormwater	Limited	Occasional/ Highly Likely	Limited	Low	Medium
Landslides, Mudslides, and Debris Flows	Limited	Occasional	Limited	Low	Medium
Levee Failure	Limited	Unlikely	Limited	Low	Medium
Pandemic	Extensive	Likely	Catastrophic	Low	Medium
Seiche	Limited	Unlikely	Limited	Low	Medium
Severe Weather: Extreme Heat	Extensive	Highly Likely	Limited	Low	High
Severe Weather: Freeze and Snow	Extensive	Highly Likely	Critical	Low	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Occasional	Limited	Low	Medium
Severe Weather: High Winds and Tornadoes	Extensive	Highly Likely	Critical	Low	Low
Tree Mortality	Extensive	Likely	Limited	High	High
Wildfire	Extensive	Highly Likely	Critical	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

Q.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District’s hazards and assess the District’s vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

Q.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section Q.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table Q-2) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

Q.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District’s total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the PCRCDD’s assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

The PCRCD owns no facilities or properties.

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. PCRCD provides services to all landowners within the District boundary and populations served align with that of Placer County.

Natural Resources

PCRCD has a variety of natural resources of value to the District. These natural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Historic and Cultural Resources

PCRCD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

Q.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table Q-2 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Agriculture Hazards

Likelihood of Future Occurrence—Highly Likely

Vulnerability—Medium

Hazard Profile and Problem Description

Before its rapid population growth in the 1970s and 1980s, Placer County was known as an agricultural and timber-producing county. Agriculture and timber production are still important sectors of the County's economy; however, manufacturing, recreation, and service industries have increased in economic importance. Agricultural lands continue to be at risk to development based on population growth projections for the County. In western Placer County, land traditionally used for agricultural purposes lies near existing cities and is expected to accommodate much of this population increase. While its agricultural land is threatened, Placer County retains a significant amount of agricultural land where the economy is intact and where farmers are a real presence in the community.

According to the HMPC, agricultural losses occur on an annual basis and are usually associated with severe weather events, including heavy rains, floods, freeze, heat, and drought. Wildfire and other hazards can also affect agricultural lands. The 2018 State of California Multi-Hazard Mitigation Plan attributes most of the agricultural disasters statewide to drought, freeze, and insect infestations. Other agricultural hazards include fires, crop and livestock disease, insects, and noxious weeds.

In addition to severe weather, invasive species can affect the agricultural industry in the County. Invasive species are organisms that are introduced into an area beyond their natural range and become a pest in the new environment. This hazard addresses the issues related to invasive pests including that pose a significant

threat to the agricultural industry and are therefore a concern in the Placer County Planning Area. This hazard does not address pests and plants that cause impacts to human health, as those issues are addressed in other planning mechanisms in the County.

Location and Extent

There is no scale that measures agricultural hazards. Agriculture in the County is at risk to many hazards: insects, weeds, severe weather, as well as downturns in commodity prices. Each of these has a different duration and speed of onset. Some, such as freeze, can have a short onset and a short duration. Drought can have a long onset and long duration. Insects and weeds can have short or long onset, and short or long durations. All agricultural losses can have a significant impact on affected communities.

Past Occurrences

There have been no state or federal FEMA disasters in the County related to agricultural hazards. There have been multiple USDA Secretarial Disaster Declarations, as shown on Table 4-6 of the Base Plan. Past occurrences regarding natural resources align with those of Placer County.

Vulnerability to and Impacts from Agricultural Pests and Diseases

According to the USDA, every year natural disasters, such as droughts, extreme heat and cold, floods, fires, hail, landslides, and tornadoes, challenge agricultural production. Because agriculture relies on the weather, climate, and water availability to thrive, it is easily impacted by natural events and disasters. Agricultural impacts from natural events and disasters most commonly include contamination of water bodies, loss of harvest or livestock, increased susceptibility to disease, and destruction of irrigation systems and other agricultural infrastructure. These impacts can have long lasting effects on agricultural production including crops, forest growth, and arable lands, which require time to mature. More specific impacts by hazard were listed in Section 4.3.6 of the Base Plan.

In addition to threats to agriculture from weather and other natural hazard events, agriculture in the County is at risk from insects, pests, and noxious weeds. Establishment of an invasive species would be detrimental to the agricultural industry of Placer County because of product losses, stringent quarantine regulations, loss of exporting opportunities and increased treatment costs. The introduction of exotic plants influences wildlife by displacing forage species, modifying habitat structure—such as changing grassland to a forb-dominated community—or changing species interactions within the ecosystem.

In addition, invasive weeds can increase fire risk in the County.

Assets at Risk

The PCRCDD owns no facilities or properties that could significantly be impacted by notable hazard events. Hazards would not significantly impact the District's ability provide service unless it was so overwhelmed with landowner service requests that additional staff would need to be hired.

Climate Change

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Climate change adaptation is a key priority of the State of California. The 2018 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state’s infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Location and Extent

Climate change is a global phenomenon. It is expected to affect the whole of the District, Placer County, and State of California. There is no scale to measure the extent of climate change. Climate change exacerbates other hazards, such as drought, extreme heat, flooding, wildfire, and others. The speed of onset of climate change is very slow. The duration of climate change is not yet known, but is feared to be tens to hundreds of years.

Past Occurrences

Climate change has never been directly linked to any declared disasters. While the District noted that climate change is of concern, no specific impacts of climate change could be recalled. The District and HMPC members did, however, note that in Placer County, the strength of storms does seem to be increasing and the temperatures seem to be getting hotter. Hotter temperatures, combined with recent drought conditions, exacerbates the potential for damaging wildfires.

Vulnerability to and Impacts from Climate Change

The California Adaptation Planning Guide (APG) prepared by California OES and CNRA was developed to provide guidance and support for local governments and regional collaboratives to address the unavoidable consequences of climate change. California’s APG: Understanding Regional Characteristics has divided California into 11 different regions based on political boundaries, projected climate impacts, existing environmental setting, socioeconomic factors and regional designations. Placer County falls within the North Sierra Region characterized as a sparsely settled mountainous region where the region’s economy is primarily tourism-based. The region is rich in natural resources, biodiversity, and is the source for the majority of water used by the state. This information can be used to guide climate adaptation planning in the District and Placer County Planning Area.

The California APG: Understanding Regional Characteristics identified the following impacts specific to the North Sierra region in which the Placer County Planning Area is part of:

- Temperature increases
- Decreased precipitation
- Reduced snowpack
- Reduced tourism
- Ecosystem change
- Sensitive species stress
- Increased soil erosion
- Increased wildfire

Assets at Risk

The PCRCD owns no facilities or properties that could significantly be impacted by notable hazard events. Hazards would not significantly impact the District’s ability provide service unless it was so overwhelmed with landowner service requests that additional staff would need to be hired.

Drought & Water Shortage

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area’s usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table Q-3.

Table Q-3 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

Placer RCD provides landowner assistance to landowners affected by drought, the impact is therefore an increase in requests for chipping services, technical assistance regarding irrigation, water and crop management and tree mortality

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

This may affect service requests for agriculture assistance and tree mortality (increase wildfire risk) in the District.

Assets at Risk

The PRCD owns no facilities or properties that could significantly be impacted by notable hazard events. Hazards would not significantly impact the District's ability provide service unless it was so overwhelmed with landowner service requests that additional staff would need to be hired.

Tree Mortality

Likelihood of Future Occurrence–Likely

Vulnerability–High

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, and contribute to future fuel loads in forests surrounding communities. During extended drought, tree mortality is driven by a build-up in endemic bark beetle populations and exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events.

Location and Extent

Onset of tree mortality events can be relatively fast; however conditions – such as high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas, and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 - 40 dead trees per acre
- Orange depicting 5 -15 dead trees per acre
- Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A number of Placer County areas were designated during this event and the majority of Placer County watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality, along with numerous Tier 1 High hazard “hot spots”. A map of these areas was shown in in Section 4.3.18 of the Base Plan.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state

of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015.

Tree mortality issues align with those of Placer County and result in an increased need for wildfire fuel reduction and mitigation. The Placer RCD offers technical assistance to landowners who experience tree mortality and help landowners apply for cost-share funds to remove dead and dying trees on their property through our partnership with the Natural Resource Conservation Service.

Vulnerability to and Impacts from Tree Mortality

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead trees within the wildland urban intermix or wildland urban interface or urban areas therefore pose a greater risk to due to their proximity to residents, businesses, and road, power, and communication infrastructure.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure.

Requests for chipping services increased by 80% over the last several years resulting in longer wait times for service.

Assets at Risk

The PRCD owns no facilities or properties that could significantly be impacted by notable hazard events. Hazards would not significantly impact the District’s ability provide service unless it was so overwhelmed with landowner service requests that additional staff would need to be hired.

Wildfire

Likelihood of Future Occurrence–Highly Likely

Vulnerability–High

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the PCRCD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where

there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Extreme Heat and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

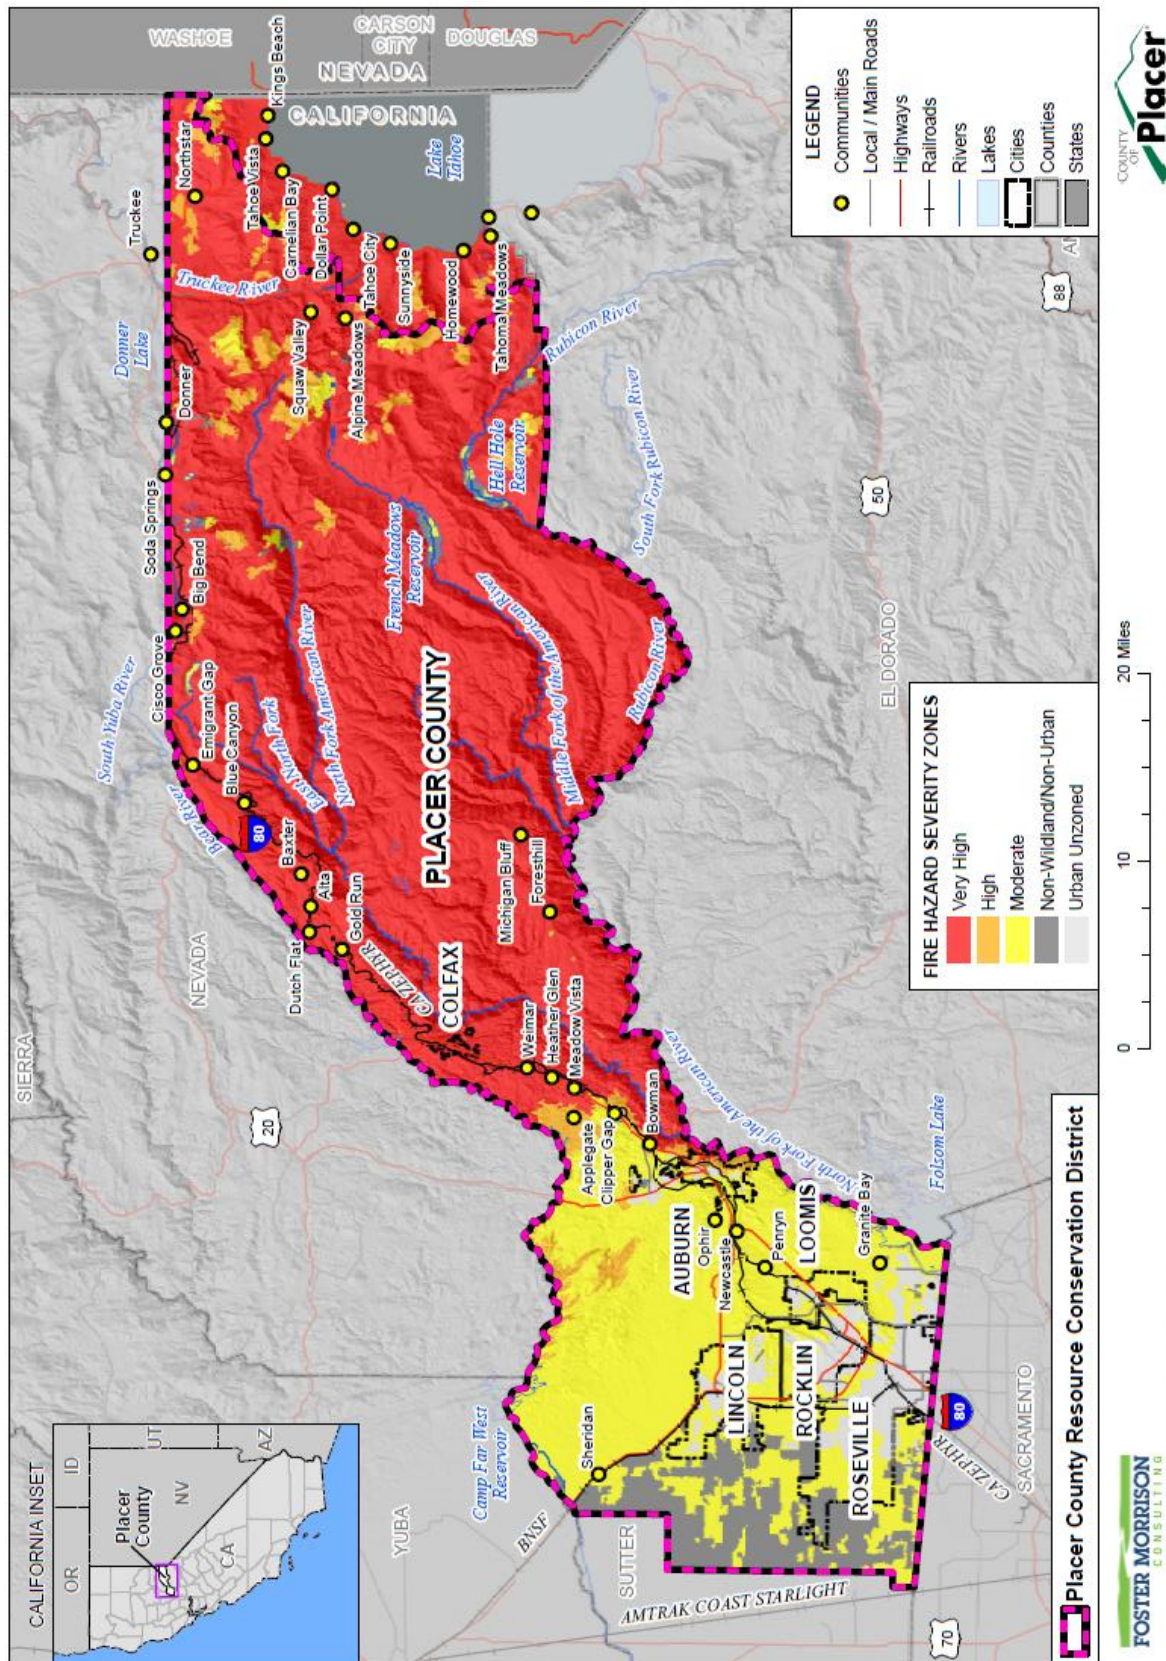

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, including periods of high winds, high temperatures, and low humidity, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the PCRCD were created. Figure Q-2 shows the CAL FIRE FHSZ in the District. As shown on the maps, FHSZs within the District range from Urban Unzoned to Very High.

Figure Q-2 PCRCO – Fire Hazard Severity Zones

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table Q-4.

Table Q-4 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

No direct impact on RCD from wildfires, but wildfires may affect landowners negatively, this may result in an increase of technical assistance provided by the District.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat

of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

Assets at Risk

The PCRCO owns no facilities or properties that could significantly be impacted by notable hazard events. Hazards would not significantly impact the District’s ability provide service unless it was so overwhelmed with landowner service requests that additional staff would need to be hired.

Q.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

Q.6.1. Regulatory Mitigation Capabilities

Table Q-5 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the PCRCO.

Table Q-5 PCRCO Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	N/A	
Capital Improvements Plan	N/A	
Economic Development Plan	N/A	
Local Emergency Operations Plan	N/A	
Continuity of Operations Plan	N/A	
Transportation Plan	N/A	
Stormwater Management Plan/Program	N/A	
Engineering Studies for Streams	N/A	
Community Wildfire Protection Plan	Y	2021 Placer County (Western Slope) CWPP
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N/A	

Building Code, Permitting, and Inspections		Y/N	Are codes adequately enforced?
Building Code	N/A	Version/Year:	
Building Code Effectiveness Grading Schedule (BCEGS) Score	N/A	Score:	
Fire department ISO rating:	N/A	Rating:	
Site plan review requirements	N/A		
Is the ordinance an effective measure for reducing hazard impacts?			
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?	
Zoning ordinance	N/A		
Subdivision ordinance	N/A		
Floodplain ordinance	N/A		
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N/A		
Flood insurance rate maps	N/A		
Elevation Certificates	N/A		
Acquisition of land for open space and public recreation uses	N/A		
Erosion or sediment control program	N/A		
Other			
How can these capabilities be expanded and improved to reduce risk?			
<p>The 2021 Placer County (Western Slope) Community Wildfire Protection Plan is the result of a community-wide planning effort. These efforts include input from five individual Fire Safe Council, two addition Fire Protection District, and bordering County, State, and Federal landowners. Field data gathering, compilation of existing documents, geographic information, and analysis provide recommendations designed to reduce the threat of wildfire-related damages to values at risk. Each assessment portion of the CWPP has identified hazards and values at risk associated with wildland fire in proximity to the Wildland-Urban Interface (WUI) areas. Each section of the CWPP has identified projects that address fuels mitigation, public education, and safety. Wildfire related mitigation efforts will be sought to be expanded through this CWPP.</p>

Placer County Resource Conservation District Long Range Strategic Plan (2016)

Placer County Resource Conservation District (RCD) is a public body or unit of government (Special District) of the State of California organized under Public Resources Code Division 9. The Placer County RCD is self-governed by a seven member Board of Directors who are appointed by the Placer County Board of Supervisors. The Directors guide programs and set policies consistent with local conservation goals and priorities. The day to day operations are carried out under the leadership and supervision of the Executive Director.

The purpose of the organization is to make available technical, financial and educational resources, whatever their source, and focus or coordinate them so that they meet the needs of the local land manager with conservation of soil, water and related natural resources.

In order for the organization to be effective, internally and externally, a management scoping system will be utilized to filter, develop, plan, budget, administer, monitor, evaluate and communicate the work of Placer County RCD. This plan lays out goals for that purpose.

Q.6.2. Administrative/Technical Mitigation Capabilities

Table Q-6 identifies the District department(s) responsible for activities related to mitigation and loss prevention in PCRCD.

Table Q-6 PCRCD’s Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N/A	
Mitigation Planning Committee	N/A	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	N/A	
Mutual aid agreements	N/A	
Other		
		Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Staff	Y/N FT/PT	
Chief Building Official	N/A	
Floodplain Administrator	N/A	
Emergency Manager	N/A	
Community Planner	N/A	
Civil Engineer	N/A	
GIS Coordinator	N/A	
Other	Y	Executive Director and Program Administrator are trained in mitigation.
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	N/A	
Hazard data and information	N/A	
Grant writing	Y	PRCD does not enforce regulations. We have a part-time grant writer to acquire funding for District activities. The coordination with between staff and partners is effective- however this position would be more effective as a full-time position.
Hazus analysis	N/A	
Other		
How can these capabilities be expanded and improved to reduce risk?		
By hiring a full-time grant writer PCRCD would be more effective at acquiring funding to address natural resource hazards in Placer County.		

Source: PCRCDD

Q.6.3. Fiscal Mitigation Capabilities

Table Q-7 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table Q-7 PCRCDD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding		
Authority to levy taxes for specific purposes		
Fees for water, sewer, gas, or electric services		
Impact fees for new development		
Storm water utility fee		
Incur debt through general obligation bonds and/or special tax bonds		
Incur debt through private activities		
Community Development Block Grant		
Other federal funding programs	Y	Federal funding is utilized for PRCD activities related to forestry and agricultural landowner technical assistance and watershed health projects.
State funding programs	Y	State funding is utilized for PRCD activities related to fuel reduction, tree mortality, landowner technical assistance and conservation education and outreach
Other		
How can these capabilities be expanded and improved to reduce risk?		
Placer RCD primarily depends on and grant funds and contractual agreements to fund District operations. In FY 2019-20 out of a \$5.5M annual budget our allocation of tax revenue from Placer County, was approximately \$400K which is considered our base funding and only reliable and stable source of funding. The remaining funds were all acquired mostly through grant funding. If grant funding or other sources of state and federal funding are not available, it greatly impacts our ability to fund operational costs, provide services and complete projects. Additional funding from Cal OES, DWR, FEMA or other entities will allow the District to complete additional mitigation related projects.		

Source: PCRCDD

Q.6.4. Mitigation Education, Outreach, and Partnerships

Table Q-8 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table Q-8 PCRCDD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	Placer RCD is a core member of the Placer County Firesafe Alliance who works closely with FireWise Communities and Fire Safe Councils to disseminate information regarding emergency preparedness and education and outreach regarding fire prevention and safety measures.
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	Placer RCD has a Firewise Trailer Program that assists community organizations in neighborhood clean-up days by loaning out tools and equipment, and providing educational resources regarding defensible space and home hardening.
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Additional funding would allow these programs to expand by providing more outreach materials and staff time to organize events and work with the public.		

Source: PCRCDD

Q.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

CALFED North Fork American River Sediment Dynamics Study

A consortium of stakeholders including Placer County RCD, the Placer County Water Agency, the US Forest Service, Sierra Pacific Industries, CA State University-Sacramento, and the North American River Watershed Coordinator, with support from Sierra College, have stewarded a study, funded by CALFED through the CA Department of Water Resources (DWR) which is due to be completed by mid-2007. One outcome of this effort is expected to be Best Management Practices for erosion reduction and reduced water quality degradation.

CALFED Working Landscapes Grant

This grant funds the development of a GIS-based American Basin Working Landscape Strategy, implementation of three specific riparian and wetland restoration projects, and preparation of the applicants to purchase up to four wildlife friendly agricultural easements.

Agricultural and Natural Resource Land Inventory

The Agricultural and Natural Resource land Inventory was developed using a number of sources. The basis for development was the parcels obtained from the County of Placer (2019). The purpose for the use of the parcels as a base was to provide a consistent and updatable GIS based record that also provide important base information such as owners and addresses. The final inventory contains only those lands identified as natural resources or agricultural lands.

Prescribed Burning on Private Lands (white paper draft)

Development of a programmatic framework that increases the use of prescribed fire on private lands through interagency collaboration. This document is being created in tandem with case study burns that will help identify realistic solutions to common roadblocks, allowing local agencies and organizations to appropriately serve landowners in low-risk/low-complexity prescribed burns. Prescribed burning on private lands will protect life, property, and ecological resources and prevent large-scale greenhouse gas emissions from catastrophic wildfire. Current State and Local programs are neither designed for, nor facilitate, burning on small private parcels of land. Approximately 40% of California’s forestlands are privately owned, creating an exciting opportunity to improve forest health engaging with and empowering our community to become more resilient to wildfire.

Other Projects

Other projects for the District are shown on Table Q-9.

Table Q-9 PCRC D Projects

Program Area	Name	Funder	Hazard Area(s)	Description
Watershed / Stream Restoration	Red Sesbania Removal	Sacramento Area Flood Control District	Climate Change, Floods: Localized stormwater	Removal of the invasive plant Red Sesbania in Dry Creek watershed
	Atwood Conservation Easement	Auburn Recreation District		11 acre conservation easement - conduct biological surveys and make resource management recommendations
	Storm Water Management	Placer County	Climate Change, Floods: Localized stormwater	Stormwater management services provided to Placer County under a cooperative agreement.
	Dry Creek Restoration (SLEWS project)	United States Fish and Wildlife Service	Climate Change, Floods: Localized stormwater	Implementation of watershed health projects in the Dry Creek.
Forestry / Fuels Reduction	Forestland Stewardship Newsletter & Forestry Committee	CALFIRE / United States Forest Service	Climate Change, Wildfire, Tree Mortality	Develop and distribute the Forestland Steward Newsletter tri-annually.

Program Area	Name	Funder	Hazard Area(s)	Description
	Placer County Chipper Program	CALFIRE	Climate Change, Wildfire, Tree Mortality	Low cost chipping service to resident of Placer County.
	Auburn Shaded Fuelbreak	CALFIRE	Climate Change, Wildfire, Tree Mortality	300- acre shaded fuel break in the Auburn State Recreation Area.
	Placer Co. Coordinated Fuelbreak - Phase 1	CALFIRE	Climate Change, Wildfire, Tree Mortality	350 acre shaded fuelbreak in the Applegate community
	Sacramento HQ Agreement	CALFIRE	Climate Change, Wildfire, Tree Mortality	Fuel reduction work prioritized by CALFIRE throughout Placer County
	Prescribed Burning on Private Lands Pilot Program	CALFIRE	Climate Change, Wildfire, Tree Mortality	Develop a white paper outlining a framework for implementation of prescribed burning on private lands
	NRCS Forestry 2 Agreement	US Natural Resource Conservation Service (NRCS)	Climate Change, Wildfire, Tree Mortality	NRCS Cooperative Agreement enabling RCD contractors / staff to assist NRCS with data collection, outreach, and technical assistance for private landowners with forest health concerns and cost-share programs.
	Regional Conservation Partnership Program- Tree Mortality Program	CARCD / NRCS	Climate Change, Wildfire, Tree Mortality	Program specific to the Sierra Nevada Region to help private landowners remove dead and dying trees through technical assistance and providing cost-share funds.
Soil / Ag	Soil Health Tech. Asst.	NRCS	Climate Change, Agricultural Pests and Diseases, Drought and Water Shortage	NRCS Cooperative Agreement enabling RCD contractors / staff to assist NRCS with data collection, outreach, and technical assistance for private landowners with soil health concerns and cost-share programs (rangeland, pasture, crops). Submitted a letter requesting an extension in early May.
	Urban Agriculture Technical Assistance	National Association of Conservation Districts	Climate Change, Agricultural Pest and Diseases, Drought and Water Shortage	Provide landowner technical assistance to urban agricultural producers with an emphasis on underserved communities
	Carbon Farm Planning	Carbon Cycle Institute	Climate Change, Agricultural Pest and Diseases, Drought and Water Shortage	Provide Carbon Farm planning to increase carbon sequestration program for farmers and ranchers in Placer County

Program Area	Name	Funder	Hazard Area(s)	Description
Education / Outreach	Ag Day	District-led	Climate Change, Agricultural Pest and Diseases, Drought and Water Shortage	Annual Agricultural educational field day for Placer County students (3rd-5th grade).
	Ag Tour (virtual)	Placer County	Climate Change, Agricultural Pest and Diseases, Drought and Water Shortage	Annual event for county officials and the public to gain exposure to ag related issues affecting local producers.
	FSTEP (Fireline Safety Training and Education Program)	District-led (fee for service program)	Climate Change, Wildfire, Tree Mortality	Fireline Safety Awareness for the Hired Equipment Vendors courses that are required annually for private equipment operators / vendors to be admitted onto CALFIRE / USFS led fire suppression events. Demand varies, but 8-12 classes (40 students each) are typically hosted by Placer RCD.
	Firewise Trailer Program	California Fire Foundation, Listos	Climate Change, Wildfire, Tree Mortality	Outreach program providing residents to access of tools for fuel reduction and education regarding defensible space, home hardening and wildfire prevention and safety
	Fire Prevention Education	CALFIRE	Climate Change, Wildfire, Tree Mortality	Developing outreach material for homeowners regarding wildfire safety and prevention in partnership with Placer County and CALFIRE.

Source: PCRCD

Q.7 Mitigation Strategy

Q.7.1. Mitigation Goals and Objectives

The PCRCD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

Q.7.2. Mitigation Actions

The planning team for the PCRCD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Agriculture Pests and Diseases
- Climate Change
- Drought & Water Shortage
- Tree Mortality

➤ Wildfire

Though initially considered a priority hazard, due to the difficulty in the District in having direct mitigation actions for drought, it was dropped as a hazard for mitigation planning purposes. The hazards addressed below still include drought, as its effects are mitigated by these actions.

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Fuel Breaks – Wildland Urban Interface (WUI)

Hazards Addressed: Wildfire, Tree Mortality, Climate Change, Drought and Water Shortage

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The purpose of a Shaded Fuel Break within the WUI is to minimize destruction to communities from wildfire and to protect and enhance natural resources, watershed and habitat of western Placer County. When complete, these projects will help protect the community’s identified as “Communities at Risk from Wildfire” and identified as communities with the WUI, listed in the CWPP. These are important especially in times of drought. Shade in these areas conserves moisture.

This practice applies to all communities within the WUI where protection from wildfire is needed. These Shaded Fuel breaks are planned thinning of dense vegetation in an area approximately 300 feet wide where fire does not easily move from the ground into the overhead tree canopy and to allow fire resources to utilize such a location to increase probability of success during fire suppression activities. Fuel break width will be dependent upon the fuels and topography in any given area.

For our purposes, a strategic fuel break is typically placed to protect the communities identified in the Western Slope CWPP WUI, for that specific Fire Safe Council.

The Placer County Fire Safe Alliance and Fire Safe Councils have worked with County, State, and Federal agencies to identify areas within their jurisdictions to develop shaded fuel breaks to protect specific communities and watersheds within the WUI.

Project Description: Fuel reduction work is subject to specific terrain and environmental conditions and treatments may include removal of trees and vegetation by hand crews, chipping, mastication, grazing, herbicide or prescribed burning.

Other Alternatives: Rely on the individual property owner or land managers within the WUI to develop fuel breaks to protect resources and assets from fire that may spread from the wildland into urban areas.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Work with the current property owner or land manager to implement shaded fuel breaks identified in the Western Slope CWPP WUI area. Apply for local, State, or Federal funding to implement these plans.

Responsible Agency/ Department/Partners: Placer County Resource Conservation District, Placer County, Stakeholders, & Landowners

Cost Estimate: The costs for the individual projects are identified in the Western Slope CWPP Project Planning Worksheets.

Benefits (Losses Avoided): Reduced risk of loss of life and property from catastrophic wildfire in developed communities, towns, and cities within the County.

Potential Funding: County, State, and Federal funding

Timeline: These projects are ongoing. Each project within the Western Slope CWPP is reviewed annually and updated as needed or removed if completed.

Project Priority (H, M, L): High

Action 2. Fuel Break – Large Strategic

Hazards Addressed: Wildfire, Tree Mortality, Climate Change, Drought and Water Shortage

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Large Strategic Fuel Break projects will provide landscape scale community protection in our area. When complete, these projects will help protect the communities identified as “Communities at Risk from Wildfire” listed in the National Fire Plan.

This practice applies to all communities where protection from wildfire is needed. These Strategic Fuel breaks are planned and located on the landscape as part of a conservation management system for a land unit where there is a need to control the risk of the spread of fire into our communities as well as to protect watersheds, critical infrastructure, and commerce traveling on our freeways and railways. Typically, they break up large, continuous tracts of dense natural fuels, thus limiting uncontrolled spread of fire, and are commonly associated with firebreaks (permanent or temporary strips of bare or vegetated land planned to retard fire). For our purposes, a strategic fuel break is typically placed to protect the communities identified in the Western Slope CWPP for that specific Fire Safe Council area.

The Placer County Fire Safe Alliance and Fire Safe Councils have worked with County, State, and Federal agencies to identify areas within their jurisdictions to develop large strategic fuel breaks to protect specific communities and watersheds within the County.

Project Description: Fuel reduction work is subject to specific terrain and environmental conditions and treatments may include removal of trees and vegetation by hand crews, chipping, mastication, grazing, herbicide or prescribed burning.

Other Alternatives: Rely on the individual property owner or land managers to develop strategic fuel breaks to protect resources and assets that may be outside of their ownership or responsibility.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Work with the current property owner or land manager to implement strategic fuel breaks identified in the Western Slope CWPP. Apply for local, State, or Federal funding to implement these plans.

Responsible Agency/ Department/Partners: Placer County

Cost Estimate: The cost for the individual projects is identified in the Western Slope CWPP Project Planning Worksheets

Benefits (Losses Avoided): Reduced risk of loss of life and property from catastrophic wildfire in developed communities, towns, and cities within the County.

Potential Funding: County, State, and Federal funding

Timeline: These projects are ongoing. Each project within the Western Slope CWPP is reviewed annually and updated as needed or removed if completed.

Project Priority (H, M, L): H

Action 3. Defensible Space Programs (Placer County Chipper Program)

Hazards Addressed: Wildfire, Tree Mortality, Climate Change, Drought and Water Shortage

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: These projects address the ongoing need to manage fuels in and around privately owned homes, businesses and communities, freeways and roadways, and “Assets at Risk” in Placer County. Small communities, individual property owners and infrastructure assets can be impacted by roadside fire starts and fire starts moving into or out of private property.

Project Description: Fuel reduction work is subject to specific terrain and environmental conditions and treatments may include removal of trees and vegetation by hand crews, chipping, mastication, grazing, herbicide or prescribed burning.

Other Alternatives: Each property owner or land manager needs to manage properties and infrastructure within their responsibility. Spread from fire starts within their property can only be prevented or contained by the fire prevention and fuel management work done by the owner.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Work with the current property owner or land manager to implement fuels management and fire prevention projects identified in the Western Slope CWPP WUI area. Apply for local, State, or Federal funding to implement these plans.

Responsible Agency/ Department/Partners: Placer County Resource Conservation District, Placer County

Cost Estimate: The cost for the individual projects is identified in the Western Slope CWPP Project Planning Worksheets.

Benefits (Losses Avoided): Reduced risk of loss of life and property from catastrophic wildfire in developed communities, towns, and cities within the County. Loss of assets at risk can have significant impact on those outside of the County. Communication links and interstate transportation can be significantly impacted by wildfire along the Interstate 80 corridor.

Potential Funding: County, State, and Federal funding

Timeline: These projects are ongoing. Each project within the Western Slope CWPP is reviewed annually and updated as needed or removed if completed.

Project Priority (H, M, L): H

Action 4. Landowner Technical Assistance (Healthy Soils/ Carbon Farm Management Program)

Hazards Addressed: Climate change, Agricultural Hazards

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: Placer County is located in the northern region of the Sierra Nevada foothills, between El Dorado and Nevada counties. The elevation of this county ranges from approximately 570 feet in the valley to over 9,000 feet in the Sierra Nevada mountain range on the eastern side. In 2016, Placer County experienced the second highest population growth in California at 1.8%, according to the California Department of Finance. In the same report, it was noted that Rocklin, the second largest city in Placer County, grew a staggering 4.5% in 2016, the second highest of all cities in California.

These details start to showcase the diverse, rural - yet rapidly developing - landscape of Placer County. Consequently, there is an elevated need for conservation entities in this area to help educate about and implement ecologically sound practices, especially in the current state of concern with our changing climate. Now, more than ever, is the time to promote carbon sequestration practices and other soil-health enhancing activities.

While there is an expanding urban population in this area, many residents maintain or are beginning farming and ranching enterprises. The majority of these agricultural operations are small in terms of acreage and scope, but vital to preserve as working lands to enhance watershed protection and increase carbon sequestration. The location of the lands within Placer County affords unique and valuable opportunities for carbon sequestration activities due to a considerable gradient in ecosystems types (wetlands, rangelands, riparian corridors, mixed oak woodlands, montane hardwood forests, temperate coniferous forests, agriculture, etc.), in addition to plentiful and reliable access to water within most of the county.

The implementation of climate-smart practices through a carbon sequestration lens enables both Placer RCD and CCI to further the mission of our organizations. Placer RCD is enthusiastic to establish the groundwork necessary for carbon farming activities to be successful in our foothills region. With the creation of a Carbon Management Program, we will be primed and equipped to execute robust Carbon Farm Plans with interested landowners in Placer County.

Project Description: Provide technical assistance the private landowners to improve soil health and increase carbon sequestration. The following practices may be implemented depending on site specific assessment and development of conservation/carbon farming plans.

- Mulching
- Compost application
- Residue and Tillage Management, No Till/Strip Till/Direct Seed
- Multi-Story Cropping
- Windbreak/Shelterbelt Establishment
- Forage and Biomass Planting
- Crop Rotation
- Alley Cropping
- Riparian Herbaceous Cover
- Range Planting
- Critical Area Planting
- Tree/Shrub Establishment
- Vegetative Barrier
- Grassed Waterway
- Hedgerow Planting
- Conservation Cover
- Wetland Restoration
- Contour Buffer Strips
- Riparian Restoration

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Placer County Sustainability Plan, Climate Plan

Responsible Agency/ Department/Partners: Placer County Resource Conservation District, Placer County, Carbon Cycle Institute, National Association of Conservation Districts, National Resource Conservation Service

Cost Estimate: \$100,000 annually

Benefits (Losses Avoided): Carbons sequestration

Potential Funding: Currently funding includes grants from Carbon Cycle Institute, National Association of Conservation Districts, Natural Resource Conservation Service

Timeline: Ongoing

Project Priority (H, M, L): H

Annex R Placer County Water Agency

R.1 Introduction

This Annex details the hazard mitigation planning elements specific to Placer County Water Agency (PCWA or Agency), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the Agency. This Annex provides additional information specific to PCWA, with a focus on providing additional details on the risk assessment and mitigation strategy for this Agency.

R.2 Planning Process

As described above, the Agency followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the Agency formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table R-1. Additional details on plan participation and Agency representatives are included in Appendix A.

Table R-1 PCWA – Planning Team

Name	Position/Title	How Participated
Andy Fecko	General Manager	MS Teams access for documents and collaboration.
Brent Smith	Dir. Technical Svs.	MS Teams access for documents and collaboration.
Jay L'Estrange	Dir. Power Generation	MS Teams access for documents and collaboration.
Tony Firenzi	Dir. Strategic Affairs	MS Teams access for documents and collaboration.
Darin Reintjes	Dir Resource Mgt.	MS Teams access for documents and collaboration.
Dan Kelly	Counsel	MS Teams access for documents and collaboration.
Daryl Hensler	Dir. Field Svs.	MS Teams access for documents and collaboration.
Matt Young	Dir. Customer Svs.	MS Teams access for documents and collaboration.
Joseph Parker	Dir. Finance	MS Teams access for documents and collaboration.
Michael Willihnganz	Dir. Admin. Svs.	MS Teams access for documents and collaboration.
Ryan Cline	Dir. Energy Mkt.	MS Teams access for documents and collaboration.
Linda Higgins	Deputy Dir. CS	MS Teams access for documents and collaboration.
Keith Brintnall	Maintenance Coord.	MS Teams access for documents and collaboration.
Sean Loman	Maintenance Coord.	MS Teams access for documents and collaboration.
Rodney Lake	Maintenance Coord.	MS Teams access for documents and collaboration.

Name	Position/Title	How Participated
Randy Cox	Water Mgt. Specialist	MS Teams access for documents and collaboration.
Richard Vorous	Hydro Engineer II	MS Teams access for documents and collaboration.
Jeremy Shepard	Deputy Dir. Eng.	MS Teams access for documents and collaboration.
Aaron Sullivan	Engineering Svs. Mgr.	MS Teams access for documents and collaboration.
Kyle Dushane	Hydro Engineer II	MS Teams access for documents and collaboration.
Ed Horton	Consultant	Review of mitigation list and suggestions
Peter Cheney	Risk & Safety Mgr.	Internal and external liaison, meetings and editing.

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the Agency integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the Agency incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table R-2.

Table R-2 2016 LHMP Incorporation

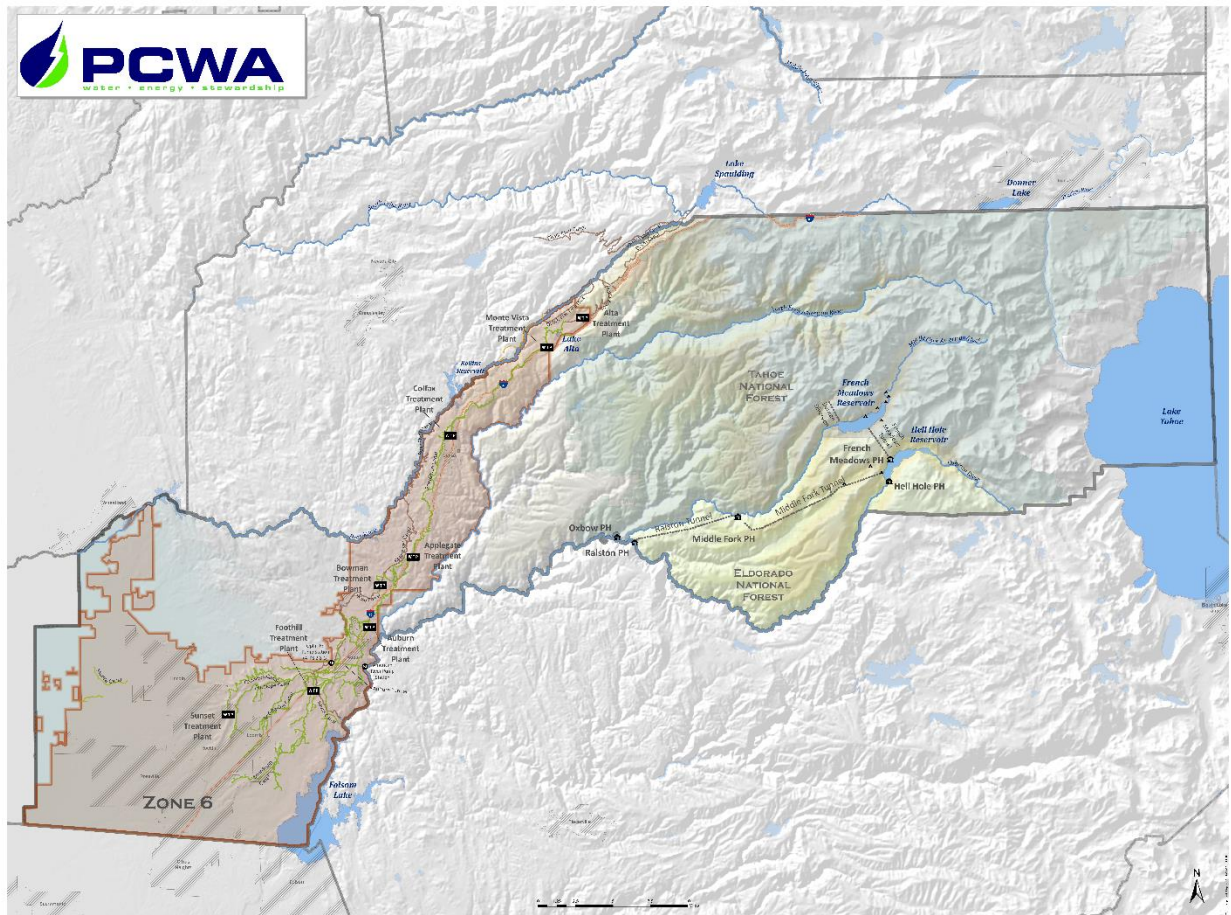

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
Canal Gunite Projects – Soil bank erosion and water conservation for drought.	Ongoing in capital planning budgets and operations. \$1M per. year.
Canal Gunite Middle Fiddler Green & Pulp Mill	FEMA Claims & internal funding for continued service
Hillside Slope Stabilization. Rockfall anchors and netting at Interbay Road	Insurance funded loss, repair prevents /limits additional loss. Ongoing Capital Plans
Hell Hole Dam Core Raise	Capital Project increasing storm water capacity and storage.
French Meadows Forest Fire Restoration Project	Community partnership and funding to reduce high-severity wildfires and watershed restoration.
Replace wooden flume structures to prevent wildfire and hazardous materials service interruptions.	Capital plan and spending. Piped Long Ravine, Secret Town, Penryn #1 Fumes put into pipe.
American River Pump Station hardening & repair after 2017 flooding/storms.	FEMA Claims & internal funding for continued service
LL Anderson Dam Spillway Modification.	Completed Capital Project for storm water management.
Multiple water system inerties increasing redundancy of water supply. 2017-2019	3 Capital Projects completed with Nevada Irrigation District, Mt. Vernon, Locksley Lane and the Live Oak Intertie
Vegetation Management & Brushing Maidu Field Office Canyon Fire Resiliency Project	2020 Agency Capital funding in conjunction with
Vegetation Management & Brushing below American River Pump Station power lines.	2020 Agency Operational Funding
Vegetation Management & Brushing	2019 Monta Vista Treatment Plant, Operational Funding and partnership with Cal Fire
Vegetation Management & Brushing	2015 Lake Arthur 33-Acres, partnership with Cal-Fire
Vegetation Management & Brushing	2016/17 Lake Theodore 78-Acres, Partnership with Cal Fire

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
Vegetation Management & Brushing	2018 Bill Francis Drive project with Cal-Fire
Debris, sedimentation de-silting projects for dam safety and water storage	Ralston Afterbay, North & South Fork Diversions 2016, 17, and 18 Capital and Emergency Projects
Dam management Mammoth reservoir low level outlet replacement	Capital project replacing

R.3 Agency Profile

The Agency profile for the PCWA is detailed in the following sections. Figure R-1 displays a map and the location of the Agency within Placer County.

Figure R-1 PCWA

R.3.1. Overview and Background

The Placer County Water Agency (PCWA) encompasses the entire, 1,500-square-mile boundary of Placer County, ranging from the rim of the Sacramento Valley on the west to the Sierra Nevada and Lake Tahoe

on the east. PCWA is headquartered in Auburn, the County seat of Placer County, nestled into California's Gold Country. The Agency is self-governed with policy and regulatory decisions determined by an independently elected five-member Board of Directors.

The Placer County Water Agency was created under its own state legislation entitled the "Placer County Water Agency Act," adopted in 1957 by the California State Legislature. PCWA carries out a broad range of responsibilities including water resource planning and management, retail, and wholesale supply of irrigation, drinking water and production of hydroelectric energy.

PCWA is actively involved in various watershed areas including the American River, Yuba and Bear rivers, the Lake Tahoe/Truckee River system, the Central Valley Project, and Bay/Delta system.

Water Supply

The PCWA Water System supplies irrigation and treated water in four service zones in Central and Western Placer County, generally located along the Interstate 80 corridor between Roseville and Alta.

The Agency operates an extensive raw water distribution system that includes 170 miles of canals, ditches, flumes and several small reservoirs. Raw water feeds the drinking water treatment plants and a significant amount of Agency raw water irrigates agricultural land and golf courses. Drinking water is produced through a network of eight water treatment plants. About 20 percent of the water supplied by PCWA is retail treated drinking water; about 80 percent is for irrigation and some portion thereof for wholesale transfer. More than 150,000 people depend on PCWA for drinking water.

Other water purveyors in Placer County include PG&E, Alpine Meadows Water Association, Applegate Community Water Association, Central Eden Valley, Christian Valley Community Service District, Dutch Flat Mutual, Eden Valley Line, Foresthill Public Utility District, Heather Glen Community Services District, Meadow Vista County Water District, Midway Heights Community Water District, North Eden Valley Water Association, The Weimar Institute, and The Weimar Water Company.

Treated Water

Surface water supplied by PCWA originates in the Sierra snowpack. Sources for PCWA treated water systems include the Yuba-Bear and American River watersheds. The source water for the treatment plants is supplied by a network of canal systems operated and maintained by PCWA and PG&E. The PCWA treated water systems supply consumers through more than 616 miles of PCWA maintained pipe to over 36,529 service connections. We estimate that PCWA serves more than 150,000 people with clean potable water.

Photograph 1 Foothill Water Treatment Plant

The PCWA's seven treated water systems including Alta, Applegate, Bianchi, Auburn/Bowman, Colfax, Foothill-Sunset, and Monte Vista. Six of the water systems are supplied through water treatment plants that treat surface water supplied via the PCWA canal system. The Bianchi system serves surface water purchased by the City of Roseville.

Fire Hydrants

The Agency provides water to 5,454 fire hydrants over some 51 Fire Service zones through the treated water system. This critical service does not include drafting from canals, rural locations, or reservoirs. Treatment and distribution operators monitor water usage and adjust for large multiple alarm fires and wildfire extinguishing water consumption.

Irrigation

About two thirds of the water supplied annually by PCWA is used for irrigation on the farms, ranches, landscapes, parks and golf courses of Placer County. The Agency operates 170 miles of canals, flumes reservoirs, and diversions to supply customers with untreated “raw” water. Approximately 4,283 irrigation water customers purchase water directly off from the canal system. The irrigation season normally runs from April 15 through October 15; however, many customers purchase water year-round. The irrigation season typically begins two weeks later in the higher elevation service areas around Colfax. Canal repair outages are typically scheduled in the early fall, between the irrigation season and heavy rains.

The PCWA irrigation water system also provides water for wildlife, riparian habitat, fire protection, recreation and scenic beauty. The Agency is very active in protecting the watershed and the quality of its source water.

Wholesale Water

PCWA wholesales both treated and untreated water to at least 14 other water companies, agencies, or districts locally and regionally. We estimate that wholesale raw water serves another 98,741 consumers for a total end user customer base of 248,835 people.

Power System

The PCWA Power System operates the Middle Fork American River Project (MFP), which is the eighth largest public power project in California. Completed in 1967 the MFP includes two major reservoirs, Hell Hole and French Meadows, seven dams, five hydroelectric power plants, and 24 miles of tunnels and related facilities. The project also includes recreational opportunities and facilities located adjacent to the high mountain reservoirs.

Photograph 2 Interbay Dam

On average (since 2013) The Middle Fork Project has produced an average of 1,100 Gigawatt hours of energy per year, which is enough clean, hydroelectric energy to power more than 165,000 homes. PCWA’s power output is distributed through Pacific Gas & Electric Company lines to the power grid, where the energy is sold on the open Cal-ISO power market.

R.4 Hazard Identification

PCWA identified the hazards that affect the Agency and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to Agency (see Table R-3).

Table R-3 PCWA—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Significant	Occasional	Critical	Medium	Medium
Avalanche	Limited	Occasional	Limited	Low	Medium
Climate Change	Extensive	Likely	Limited	High	–
Dam Failure	Significant	Unlikely	Catastrophic	High	Medium
Drought & Water Shortage	Extensive	Highly Likely	Critical	High	High
Earthquake	Limited	Likely	Limited	Low	Low
Floods: 1%/0.2% annual chance	Extensive	Occasional	Limited	High	Medium
Floods: Localized Stormwater	Significant	Highly Likely	Limited	Medium	Medium
Landslides, Mudslides, and Debris Flows	Significant	Likely	Critical	High	Medium
Levee Failure	Limited	Occasional	Critical	Low	Medium
Pandemic	Extensive	Likely	Critical	Medium	Medium
Seiche	Significant	Unlikely	Catastrophic	Low	Medium
Severe Weather: Extreme Heat	Significant	Highly Likely	Negligible	Low	High
Severe Weather: Freeze and Snow	Limited	Occasional	Negligible	Low	Medium
Severe Weather: Heavy Rains and Storms	Significant	Highly Likely	Limited	Medium	Medium
Severe Weather: High Winds and Tornadoes	Significant	Highly Likely	Limited	Low	Low
Tree Mortality	Extensive	Likely	Critical	Medium	High
Wildfire	Extensive	Highly Likely	Catastrophic	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

R.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the Agency's hazards and assess the Agency's vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the Agency is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the Agency. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

R.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section R.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table R-3) affects the Agency and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

R.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the Agency's total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the Agency. This data is not hazard specific, but is representative of total assets at risk within the Agency.

Assets at Risk and Critical Facilities

This section considers the PCWA's assets at risk, with a focus on key Agency assets such as critical facilities, infrastructure, and other Agency assets and their values. With respect to Agency assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table R-4 lists critical facilities and other Agency assets identified by the Agency Planning Team as important to protect in the event of a disaster. PCWA’s physical assets, valued at over \$3.2 billion, consist of the buildings and infrastructure to support the Agency’s operations.

Table R-4 PCWA Critical Facilities, Infrastructure, and Other Agency Assets

PCWA Water System		Facility Criticality		
Asset type	Class	Replacement Value	Employees	Hazard Specific
Water Conveyance	Class 2 & 3	\$ 933,285,736	68	Earthquake, Dam Failure, Water Shortage, Flood, Landslide, Levee Failure, Heavy Rains & Storms, Wildfire and Hazardous Material Exposure
Misc.	Class 2 & 3	\$ 1,818,975		Earthquake, Dam Failure, Water Shortage, Flood, Landslide, Levee Failure, Heavy Rains & Storms, Wildfire and Hazardous Material Exposure
Offices	Class 2 & 3	\$ 21,518,518	110	Earthquake, Heavy Rains & Storms, Wildfire, Pandemic and Hazardous Material Exposure
Pump Stations	Class 2 & 3	\$ 39,754,605		Earthquake, Water Shortage, Flood, Heavy Rains & Storms, Wildfire and Hazardous Material Exposure
Water Tanks	Class 2 & 3	\$ 18,176,851		Earthquake, Water Shortage, Flood, Landslide, Heavy Rains & Storms, Wildfire and Hazardous Material Exposure
Water Treatment Plants	Class 2 & 3	\$ 380,728,064	38	Earthquake, Dam Failure, Water Shortage, Flood, Landslide, Levee Failure, Heavy Rains & Storms, Wildfire, Hazardous Material Exposure, and Pandemic
Grand Total		\$ 1,395,282,748	216

Asset Type		Replacement Value	Employees	Hazard Specific
Dams/Reservoirs	Class 2 & 3	\$ 1,005,509,000		Earthquake, Dam Failure, Water Shortage, Flood, Landslide, Levee Failure, Heavy Rains & Storms, Wildfire and Hazardous Material Exposure
Misc Infrastructure	Class 2 & 3	\$ 1,746,000		Earthquake, Dam Failure, Water Shortage, Flood, Landslide, Levee Failure, Heavy Rains & Storms, Wildfire and Hazardous Material Exposure
Office Residential	Class 2 & 3	\$ 15,748,000		Earthquake, Dam Failure, Water Shortage, Landslide, Heavy Rains & Storms, Wildfire.
Power Systems	Class 2 & 3	\$ 766,466,000		Earthquake, Dam Failure, Water Shortage, Flood, Landslide, Levee Failure, Heavy Rains & Storms, Wildfire and Hazardous Material Exposure, Freeze & Snow, High Winds, Tree Mortality
Tunnels	Class 2 & 3	\$ 37,597,000		Earthquake, Dam Failure, Flood, Landslide, Heavy Rains & Storms, Wildfire and Hazardous Material Exposure
Grand Total		\$ 1,827,066,000	35	

Source: PCWA

Populations Served

PCWA serves both incorporated and unincorporated areas of the County. Out of the more than 380-thousand people in Placer County, PCWA is by far the largest water supplier with some 37-thousand treated water accounts. More than 4-thousand untreated water accounts (Agricultural) and 14 wholesale water distribution accounts where water is provided to other water service areas.

Natural Resources

PCWA has a variety of natural resources of value to the Agency. These natural resources parallel that of Placer County as a whole. Additionally, PCWA is actively involved in various watershed areas including the American River, Yuba and Bear rivers, the Lake Tahoe/Truckee River system, the Central Valley Project, and Bay/Delta system.

Historic and Cultural Resources

PCWA has a variety of historic and cultural resources of value to the Agency including the old State Route Highway 40 Memorial and Heritage Farmhouse at 10681 Ophir Road. Additionally, many of the flumes in the canal system have local cultural significance and are beloved by the community. The Agency has ties to both the gold mining and agricultural history of the area.

Growth and Development Trends

General growth in the Agency somewhat parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Specific Agency Planning and Development

In 2017 PCWA completed an update to the Water Connection Charge Cost Study which proposed a list of forty infrastructure projects that included the Ophir Water Treatment Plant (WTP), 24 miles of pipelines, six storage tanks, emergency standby power generation at the American River and Ophir Road Pump Stations, and three groundwater wells. The Ophir Water Treatment Plant Program is based on 30 million gallons a day (mgd) and is planned to be constructed in 10 mgd phases as demands develop in Placer County. The 2017 capital plan has provisions for capacity beyond this development horizon of 30 MGD of capacity from Ophir WTP. One of these provisions includes oversizing of the transmission pipelines from Ophir WTP towards west Placer County. The Ophir WTP will be designed to the building codes to adequately address seismic activity and will include back generators at the plant and all other critical facilities built under this program. Since 2016, three of these projects have been completed and three other projects are currently under construction in 2021. The Ophir Program considered the available general plans for Placer County, the Town of Loomis, City of Lincoln, and City of Rocklin when determining how to serve future growth in the region.

R.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table R-3 as high or medium significance hazards. Impacts of past events and vulnerability of the Agency to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the Agency to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. Vulnerability is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Agriculture Hazards

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

Before its rapid population growth in the 1970s and 1980s, Placer County was known as an agricultural and timber-producing county. Agriculture and timber production are still important sectors of the County's economy; however, manufacturing, recreation, and service industries have increased in economic importance. Agricultural lands continue to be at risk to development based on population growth projections for the County. In western Placer County, land traditionally used for agricultural purposes lies near existing cities and is expected to accommodate much of this population increase. While its agricultural land is threatened, Placer County retains a significant amount of agricultural land where the economy is intact and where farmers are a real presence in the community.

According to the HMPC, agricultural losses occur on an annual basis and are usually associated with severe weather events, including heavy rains, floods, freeze, heat, and drought. Wildfire and other hazards can also affect agricultural lands. The 2018 State of California Multi-Hazard Mitigation Plan attributes most of the agricultural disasters statewide to drought, freeze, and insect infestations. Other agricultural hazards include fires, crop and livestock disease, insects, and noxious weeds.

In addition to severe weather, invasive species can affect the agricultural industry in the County. Invasive species are organisms that are introduced into an area beyond their natural range and become a pest in the new environment. This hazard addresses the issues related to invasive pests including that pose a significant

threat to the agricultural industry and are therefore a concern in the Placer County Planning Area. This hazard does not address pests and plants that cause impacts to human health, as those issues are addressed in other planning mechanisms in the County.

Location and Extent

There is no scale that measures agricultural hazards. Agriculture in the County is at risk to many hazards: insects, weeds, severe weather, as well as downturns in commodity prices. Each of these has a different duration and speed of onset. Some, such as freeze, can have a short onset and a short duration. Drought can have a long onset and long duration. Insects and weeds can have short or long onset, and short or long durations. All agricultural losses can have a significant impact on affected communities.

Past Occurrences

There have been no state or federal FEMA disasters in the County related to agricultural hazards. There have been multiple USDA Secretarial Disaster Declarations, as shown on Table 4-6 of the Base Plan.

Vulnerability to and Impacts from Agricultural Pests and Diseases

According to the USDA, every year natural disasters, such as droughts, extreme heat and cold, floods, fires, hail, landslides, and tornadoes, challenge agricultural production. Because agriculture relies on the weather, climate, and water availability to thrive, it is easily impacted by natural events and disasters. Agricultural impacts from natural events and disasters most commonly include contamination of water bodies, loss of harvest or livestock, increased susceptibility to disease, and destruction of irrigation systems and other agricultural infrastructure. These impacts can have long lasting effects on agricultural production including crops, forest growth, and arable lands, which require time to mature. More specific impacts by hazard were listed in Section 4.3.6 of the Base Plan.

In addition to threats to agriculture from weather and other natural hazard events, agriculture in the County is at risk from insects, pests, and noxious weeds. Establishment of an invasive species would be detrimental to the agricultural industry of Placer County because of product losses, stringent quarantine regulations, loss of exporting opportunities and increased treatment costs. The introduction of exotic plants influences wildlife by displacing forage species, modifying habitat structure—such as changing grassland to a forb-dominated community—or changing species interactions within the ecosystem.

In addition, invasive weeds can increase fire risk in the County.

While PCWA does not have any direct agricultural risk as far as crops, approximately 2/3 of the water supplied by the agency is used for agricultural and the Agency is highly involved with water conservation and planning for the agricultural Industry. About 11% of employment is attributed to Agriculture in Placer County, with marked growth in small farms and “farm to fork” operations. The loss of PCWA’s ability to provide water through our canal system would be devastating to agriculture in the County. The loss of Agriculture in the Western part of the County would equate to a significant revenue loss for the Agency.

Assets at Risk

Financial and economic community assets are at risk

Avalanche

Likelihood of Future Occurrence–Occasional

Vulnerability–Low

Hazard Profile and Problem Description

According to the Sierra Avalanche Center, avalanches occur when loading of new snow increases stress at a rate faster than strength develops, and the slope fails. Avalanches are a rapid down-slope movement of snow, ice and debris triggered by ground shaking, sound, or human or animal movement. Avalanches consist of a starting zone where the ice or snow breaks loose, a track which is the grade or channel the debris slides down and a run-out zone where the snow is deposited.

Critical stresses develop more quickly on steeper slopes and where deposition of wind-transported snow is common. The vast majority of avalanches occur during and shortly after storms. This hazard generally affects a small number of people, such as snowboarders, skiers, and hikers who venture into backcountry areas during or after winter storms. Roads and highway closures, damaged structures, and destruction of forests are also a direct result of avalanches.

Location and Extent

The two primary factors impacting avalanche activity are weather and terrain. Large, frequent storms deposit snow on steep slopes to create avalanche hazards. Additional factors that contribute to slope stability are the amount of snow, rate of accumulation, moisture content, wind speed and direction and type of snow crystals. Topography also plays a vital role in avalanche dynamics. Slope angles between 30 to 45 degrees are optimal for avalanches. The risk of avalanches decreases on slope angles below 30 degrees. At 50 or more degrees they tend to produce sluff or loose snow avalanches that account for only a small percentage of avalanche deaths and property damage annually.

Areas prone to avalanche hazards include hard to access areas deep in the backcountry and those in the more developed higher elevations of the County in the Tahoe basin. Avalanche hazards exist in eastern Placer County where combinations of the above criteria occur. The Avalanche hazard is low, but exists as a challenge for access to the Middle Fork Power Project on the Eastern side of the County.

Past Occurrences

There have been no state or federal disasters in the County related to avalanche. No events of past avalanche have affected the Agency.

Vulnerability to and Impacts from Avalanche

Avalanches occur when the weight of new snow increases stress faster than strength of the snowpack develops, causing the slope to fail. Avalanche conditions develop more quickly on steeper slopes (located in the eastern portions of the County) and where wind-blown snow is common. Avalanche impacts vary, but include risk to property, injury, or death. Avalanches generally affect a few snowboarders, skiers, and hikers who venture into backcountry areas during or after winter storms. Avalanches cause road closures, and can damage structures and forests.

The Power operations in the Southeastern part of the County are located in wilderness areas and most of the operations are at elevations between 2,000 and 5,000 feet. Assets and transportation routes can be profoundly impacted by snow and avalanche. While the Agency owns four snowcats, safety and mobility can be significantly impacted by snow. This is further compounded by the remoteness of the area and spotty communications. This hazard may be a life safety and operational issue for staff, but is not likely to result in a long-term catastrophic property loss to the Agency.

Assets at Risk

Agency assets at risk include staff, facilities and routes of access to the Middle Fork Power Project.

Climate Change

Likelihood of Future Occurrence—Likely

Vulnerability—High

Hazard Profile and Problem Description

Climate change adaptation is a key priority of the State of California. The 2018 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state's infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Specifically, climate change in relation to water (too much, or too little) directly impact natural resources, water management, Agency operations and facilities. In 2017 a historic winter the American river rose and severely damaged the American River Pump Station, inundating rains caused the Pulp Mill and Middle Fiddler Green canals to erode and fail, as well as other road and property damage from high waters. Storms in 2017 and 2018 caused rockslides on the Blacksmith Flat Road and Interbay Road to be inaccessible. There were additional communication and power lines that failed due to storm damage. This can be contrasted with the historic Drought between 2014 and 2017 where historic levels of low precipitation and snowpack were compounded by hot days, bark beetles killing off trees and epic wildfires. Ecological issues occur with river temperatures warming and more water is needed to prevent the salination of rivers as the oceans rise. Crops with high moisture requirements were abandoned including some nut tree crops that

take years to restore. Ground water well pumping increased in the agricultural areas depleting and sometimes collapsing groundwater stores. Ultimately California has an imbalance of available fresh water to meet the long-term future demand.

Location and Extent

Climate change is a global phenomenon. It is expected to affect the whole of the Agency, Placer County, and State of California. There is no scale to measure the extent of climate change. Climate change exacerbates other hazards, such as drought, extreme heat, flooding, wildfire, and others. The speed of onset of climate change is very slow. The duration of climate change is not yet known but is feared to be tens to hundreds of years.

Past Occurrences

Climate change has not been directly cited as a specific declared disaster hazard, but is often used to explain the amplification of severe weather hazards. The Agency and HMPC members did, however, note that in Placer County, the strength of storms does seem to be increasing and the temperatures seem to be getting hotter. Hotter temperatures, combined with recent drought conditions, exacerbates the potential for damaging wildfires, drought, and tree mortality. Storm magnification has led to flooding, landslides, increasing severe weather patterns. With increased storm a precipitation there is potential for the increased probability for future levee and dam failure.

Vulnerability to and Impacts from Climate Change

The California Adaptation Planning Guide (APG) prepared by California OES and CNRA was developed to provide guidance and support for local governments and regional collaboratives to address the unavoidable consequences of climate change. California's APG: Understanding Regional Characteristics has divided California into 11 different regions based on political boundaries, projected climate impacts, existing environmental setting, socioeconomic factors and regional designations. Placer County falls within the North Sierra Region characterized as a sparsely settled mountainous region where the region's economy is primarily tourism-based. The region is rich in natural resources, biodiversity, and is the source for the majority of water used by the state. This information can be used to guide climate adaptation planning in the Agency and Placer County Planning Area.

The California APG: Understanding Regional Characteristics identified the following impacts specific to the North Sierra region in which the Placer County Planning Area is part of:

- Agricultural Hazard
- Temperature increases
- Decreased precipitation
- Dam & Levee failures
- Drought and water shortage
- Flooding
- Landslides & Debris Flows
- Increased or severe precipitation or weather events
- Reduced snowpack

- Reduced tourism
- Ecosystem change
- Sensitive species stress
- Tree Mortality
- Wildfire
- Public Safety Power Shutoff – energy reliability

Assets at Risk

All Agency assets are at risk from climate change in relation to water being the principal function and purpose of the Agency and in which all production is derived. Additionally, increased temperatures impact water use, and availability. Amplified weather patterns put facilities are risk from severe weather hazards of all kinds and secondary hazards and exposures such as wildfire.

Dam Failure

Likelihood of Future Occurrence–Unlikely
Vulnerability–High

Hazard Profile and Problem Description

Dams are manmade structures built for a variety of uses including flood protection, power generation, agriculture, water supply, and recreation. When dams are constructed for flood protection, they are usually engineered to withstand a flood with a computed risk of occurrence. For example, a dam may be designed to contain a flood at a location on a stream that has a certain probability of occurring in any one year. If prolonged periods of rainfall and flooding occur that exceed the design requirements, that structure may be overtopped or fail. Overtopping is the primary cause of earthen dam failure in the United States.

Location and Extent

Dam failure is a natural disaster from two perspectives. First, the inundation from released waters resulting from dam failure is related to naturally occurring floodwaters. Second, a total dam failure would most probably happen as a consequence of the natural disaster triggering the event, such as an earthquake. There is no scale with which to measure dam failure. However, Cal DWR Division of Safety of Dams (DOSD) assigns hazard ratings to dams within the State that provides information on the potential impact should a dam fail. The following two factors are considered when assigning hazard ratings: existing land use and land use controls (zoning) downstream of the dam. Dams are classified in four categories that identify the potential hazard to life and property: Low, Significant, High, and Extremely High. These were discussed in more detail in Section 4.3.9 of the Base Plan.

While a dam may fill slowly with runoff from winter storms, a dam break has a very quick speed of onset. The duration of dam failure is generally not long – only as long as it takes to empty the reservoir of water the dam held back. The danger would continue for as long as the flood waters from the dam failure took to drain downstream. However, the damage to the Agency operations could be catastrophic. While dam failure inundation maps indicate much of the inundation area is rural undeveloped land, there are bridges and PCWA assets that would potentially suffer severe damage.

Past Occurrences

There has been no federal or state disaster declarations for dam failure in the County. The only known dam failure for the Agency occurred in 1964 When torrential rains caused a failure of the Hell Hole Dam that was under construction and only 20% completed at the time. There were several small bridge failures and a bridge failure at the American River Confluence.

Vulnerability to and Impacts from Dam Failure

Dam failure flooding would vary by community depending on which dam fails and the nature and extent of the dam failure and associated flooding. Impacts to the Agency from a dam failure flood could include loss of life and injury, flooding and damage to property and structures, damage to critical facilities and infrastructure, loss of natural resources, and all other flood related impacts. Evacuations and associated economic losses could also be significant.

The Power Division has four dams and three smaller diversions. A dam failure at the top of the Watershed theoretically could cascade through various facilities downstream causing additional loss or failures. Life safety concerns include gold claims and recreational use downstream, however immediate downstream exposure does not include densely populated residential areas. Large property concerns include bridges close to the American River Confluence that could be affected. Folsom Lake would be affected proportionately. Dam failure could lead to a catastrophic operational loss for the agency. The Division of Safety of Dams (DSOD) rates the Power Division dams in the following categories: (2) extremely high downstream hazard, (1) significant downstream hazard and (1) a low downstream hazard.

The Water Division has nine lakes/reservoirs used for water storage and control. One of which is completely dry and abandoned. All have small dams or flow control. The Division of Safety of Dams (DSOD) rates the Water Division dams as: (1) a high downstream hazard, (3) significant downstream hazard and (1) a low downstream hazard. Most are in rural modestly populated areas.

PG&E also operates at least four dams or reservoirs that significantly impact our water supply and service area.

Assets at Risk

Downstream assets such as powerhouses, other dams and water intake structures are at risk from dam failure. Other public infrastructure assets such as bridges are immediately in the downstream inundation area.

Drought & Water Shortage

Likelihood of Future Occurrence–Highly Likely

Vulnerability–High

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area’s usual water-consuming activities. Historically, California has experienced as many as twelve droughts, since being formally recorded in the mid-1800s. Typically a drought will last from two to seven years. Perhaps the worst was between 1912 and 1934 (as shown on Figure R-2) where over a span of twenty-two years there was only five years of above average precipitation. California having a population of more than 39-million people, and as a major agricultural producer can suffer severe economic and environmental impact. Drought may be amplified by weather conditions; economic or political actions; and/or population and farming. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for environmental sustenance, agriculture, manufacturing, tourism, recreation, and commercial and domestic consumption. As the population in the area continues to grow, so will the demand for water.

Figure R-2 Placer County Precipitation

Source: NOAA National Centers for Environmental information, Climate at a Glance: County Time Series, published April 2021, retrieved on 3/29/2021 from <https://www.ncdc.noaa.gov/cag/>

Location and Extent

Drought and water shortage is normally a regional phenomenon. The County, as well as the Agency, is at risk and water supplies impact the remainder of the State. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which is not likely to impact water storage carry over. Alternatively, a drought may extend for years depleting water storage and availability and creating a water crisis, potentially extending throughout the State and severely impacting agriculture and the economy as a whole. Current drought conditions in the Agency and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table R-5.

Table R-5 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014-2017	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the Agency are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

The historic drought between 2012 and 2016 resulted in a reduction in the local water supply; however, the drought resulted in more significant demand reductions forced by regulatory mandates. In general, summer water use in 2015 had been cut by over 30% relative to 2013 levels. Economically the drought has impacted water sales reducing revenues for the Agency. When prolonged drought occurs it impacts capital improvement plans and operations over time. Agriculture in the region suffered a significant economic impact from reductions. The most significant threat to local economy is the concern of major populations not being adequately served from Folsom Lake due to the water surface going below the intake level. There was great risk of this occurring in both 2014 and 2015. However, Folsom Lake operations were modified (just in time) to prevent this crisis. The issue is complex statewide water management problem beyond the scope of just Placer County. Droughts can bring on conservation and control measures by the State Water Resources Control Board that impact both water consumption and Agency revenues.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the Agency, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, geopolitical, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more contentious. Climate change may create additional impacts to drought and water shortages in the County and the Agency.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Wildfire Section below, as well as in Section 4.3.2 of the Base Plan.

Placer County Water Agency is fortunate to be at the top of the watershed with plentiful water storage under normal circumstances. However; the State Water Resources Control Board can implement conservation regulation and control that can severely impact the local conditions and use of water.

Assets at Risk

Economically the entire Agency is impacted. Power generation is reduced and revenues from water sales are decreased. The result is that capital projects may be postponed for delivery infrastructure - increasing the potential for system failures. Additional effort must go into water management, public awareness and political involvement. Ultimately cascading impacts include increased risk of wildfire, energy disruption and economic challenges.

Flood: 1%/0.2% Annual Chance

Likelihood of Future Occurrence—Occasional/Unlikely

Vulnerability—High

Hazard Profile and Problem Description

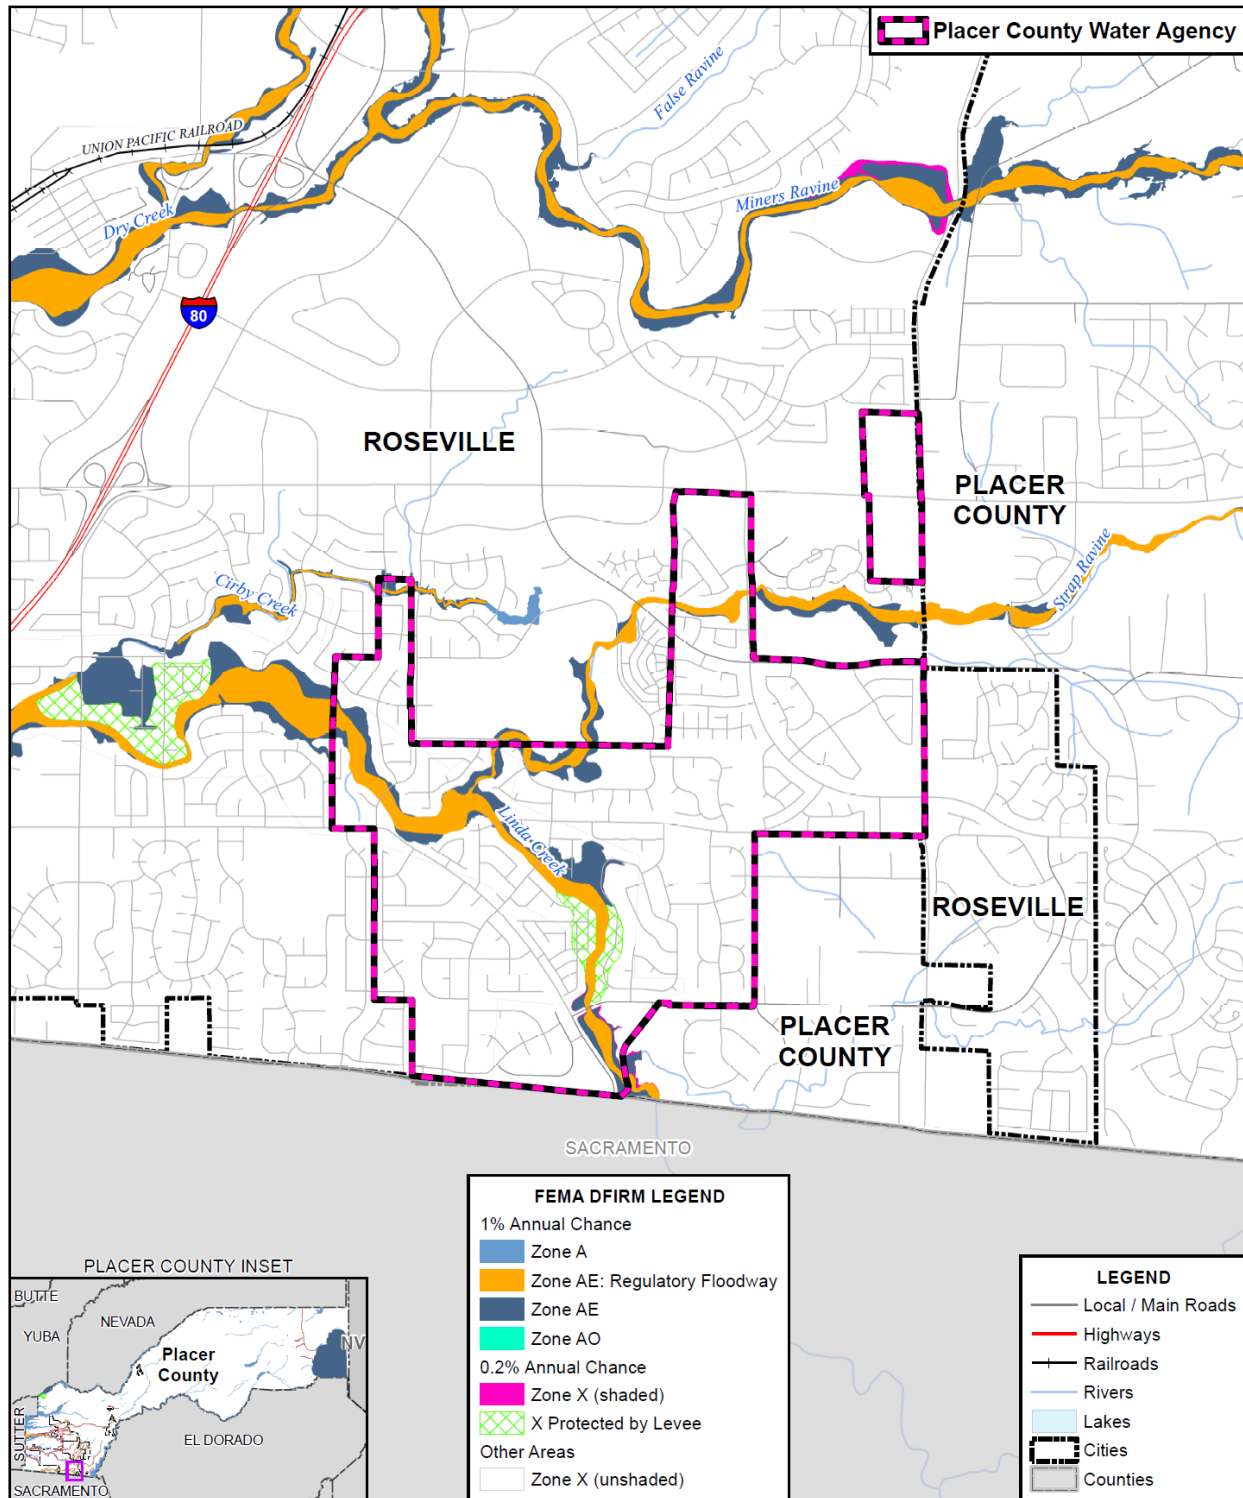

This hazard analyzes the FEMA DFIRM 1% and 0.2% annual chance floods. These tend to be the larger floods that can occur in the County or within the Agency and have caused damages in the past. Historically, the Agency has been at risk to flooding primarily during the winter and spring months when river systems in the County swell with heavy rainfall and snowmelt runoff. Normally, storm floodwaters are kept within defined limits by a variety of storm drainage and flood control measures. Occasionally, extended heavy rains result in floodwaters that exceed normal high-water boundaries and cause damage.

As previously described in Section 4.3.12 of the Base Plan, the Placer County Planning Area and the PCWA have been subject to historical flooding.

Location and Extent

The PCWA has service areas located in the 1% annual chance floodplain. This is seen in Figure R-4.

Figure R-4 PCWA – FEMA DFIRM Flood Zones

0 0.65 1.3 Miles

Data Source: FEMA DFIRM 11/2/2018, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Table R-6 details the DFIRM mapped flood zones within the 1% annual chance flood zone as well as other flood zones located within the Agency.

Table R-6 PCWA– DFIRM Flood Hazard Zones

Flood Zone	Description	Flood Zone Present in the Agency
A	Areas subject to inundation by the 1% annual-chance flood event generally determined using approximate methodologies. Because detailed hydraulic analyses have not been performed, no Base Flood Elevations (BFEs) or flood depths are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	
AE	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE – Regulatory Floodway	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply. Different from AE in that it adds the water course and adjacent lands that must be reserved in order to discharge the base flood without increasing the water surface elevation by more than one foot.	X
AH	An area inundated by 1% annual chance flooding (usually an area of ponding), for which BFEs have been determined; flood depths range from 1 to 3 feet	
AO	Areas subject to inundation by 100-year shallow flooding (usually sheet flow on sloping terrain) where average depths are between one and three feet	
Shaded X	500-year flood the areas between the limits of the 1% annual chance flood and the 0.2-percent-annual-chance (or 500-year) flood	
X Protected by Levee	An area determined to be outside the 500-year flood and protected by levee from 100-year flood	
X	Areas outside of known floodplains.	X

Source: FEMA

Additionally, flood extents can generally be measured in volume, velocity, and depths of flooding. Expected flood depths in the Agency vary, depending on the nature and extent of a flood event; specific depths are unknown. Flood durations in the Agency tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Flooding in the Agency tends to have a shorter speed of onset, due to the amount of water that flows through the Agency’s service area.

Past Occurrences

A list of state and federal disaster declarations for Placer County from flooding is shown on Table R-7. These events also likely affected the Agency to some degree.

Table R-7 Placer County – State and Federal Disaster Declarations from Flood 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Flood (including heavy rains and storms)	16	1950, 1955, 1958 (twice), 1962, 1963, 1969, 1973, 1980, 1983, 1986, 1995 (twice), 1997, 2008, 2017	13	1955, 1958, 1962, 1964, 1969, 1983, 1986, 1995 (twice), 1997, 2006 (twice), 2017

Source: Cal OES, FEMA

Historical amounts of precipitation fell in January and February of 2017, along with antecedent conditions from a wet October and December led to high river levels with many forecast points along the major rivers reaching monitor or even flood-stage and above. Some rivers reached record or near-record levels and there was flooding along many creeks and streams. ([CNRFC - Storm Summaries - Jan and Feb 2017 \(noaa.gov\)](#)) Local and State and Federal disasters were declared. PCWA suffered more than one-million dollars in losses to six Agency facilities with the American River Pumpstation Intake structures being completely submerged at a bend in the river. Additional difficulties and claims from canal run-off and spills were managed within the Agency.

Figure R-5 American River Pump Station

Source: PCWA

Vulnerability to and Impacts from Flood

Floods have been a part of the Agency’s historical past and will continue to be so in the future. Dam safety plans anticipate historical flooding, and operations adjust to rising storm water. As seen by the Afterbay Dam gates on the Middle Fork of the American River on Figure R-6. The gates are in the full-open position and there was ample capacity for 2017 storm waters. One of the Agency challenges brought on by storm waters is managing debris and sediment both of which have been increased by wildfires. Sediment decreases the reservoir capacity, and debris endangers the dams and physical structures. Managing these two issues can be dangerous during a storm and lead to tens of millions of dollars of remediation that can last years later, after the storm.

Figure R-6 Afterbay Dam

Source: PCWA

Heavy rains and storms also create canal management issues. Debris washed, blown and fallen into the canal system create over topping of the canals in unintended areas. The over topping of the canals can lead to erosion, landslides, and ultimately a failure of the canal. Spillways for the management of the canals have always existed, but with increasing development the heavy spilling of the canals can surprise landowners who are in the spill channel. The greater the storm runoff, the more spillways and excess water must be released.

Figure R-7 Pulp Mill Canal 2017

Source: PCWA

During winter months, long periods of precipitation and the timing of that precipitation are critical in determining the threat of flood, and these characteristics further dictate the potential for widespread

structural and property damages. Predominantly, the effects of flooding are generally confined to areas near the waterways of the County. As waterways grow in size from local drainages, so grows the threat of flood and dimensions of the threat. This threatens water management structures in the floodplain. Structures can also be damaged from trees falling as a result of water-saturated soils. Electrical power outages happen, and the interruption of power causes major problems. Loss of power is usually a precursor to closure of governmental offices and community businesses. Roads can be damaged and closed, causing safety and evacuation issues. People may be swept away in floodwaters, causing injuries or deaths.

Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits. Direct impacts, such as drowning, can be limited with adequate warning and public education about what to do during floods. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, loss of environmental resources, and economic impacts.

Placer County Water Agency does not handle storm water systems or reclaimed water. The storm exposures mainly arise from open water supply systems including canals and flumes. During major storm events water storage being released into the canal system is restricted and the agency opens spillway relief systems to allow for extra capacity. The main hazard that remains is debris swept into the canal system that potentially collects to block free flowing water. This can cause overtopping. Crews regularly patrol during storms to prevent debris build up at trash-racks and culverts.

The American River Pump Station has some degree of vulnerability during a 200 to 500 year storm due to its location along the Middle Fork of the American River.

The Power Project has potential storm exposure from over topping of dams at the top of the Middle Fork Project and to power plants along the river through descending elevations. Past forest fires compound watershed hazards with increased sedimentation causing water levels to rise. Additionally, floating forest-fire debris can enter into the watershed and cause damage and potential destruction to dams, diversions and related facilities along the river.

Assets at Risk

The majority of operational hazards are at or along rivers or canal systems. All Agency assets with the exception of business offices would at some degree of risk from flooding.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Flooding occurs in areas other than the FEMA mapped 1% and 0.2% annual chance floodplains. Localized, stormwater flooding occurs throughout the County during the rainy season from November through April. Prolonged heavy rainfall contributes to a large volume of runoff resulting in high peak flows of moderate duration. Heavy snowpack with unseasonably warm high altitude temperatures can also create rapid snow melt and extreme run off conditions.

Location and Extent

The PCWA is subject to localized flooding throughout the Agency. Expected flood depths in the Agency vary by location. Flood durations in the Agency tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. California is prone to atmospheric rivers that dump copious amounts of rain over short periods of time. Localized flooding in the Agency tends to have a shorter speed of onset, especially when antecedent rainfall has soaked the ground and reduced its capacity to absorb additional moisture.

Typical locations of concern are the management of dams, levies, and canal systems where debris or sedimentation have created areas of blockage or decreased capacity. As in the above 1%/2% flood years canal systems can be overtopped in low areas when there is intense rain in combination with fall debris. Overtopping can erode the embankments jeopardizing the integrity of the canal. Guniting the canal system can enhance the stability of earthen canals and the Agency budgets a million dollars a year to repair or guniting earthen canals.

As the County becomes more increasingly populated, and a run of dry years has become a collective memory; the active use of historic spillways can be surprising to those that may have just moved to the area or who have repurposed land in a spillway that may have been dry for years. It is critical that structures or uses of spillway land be restricted.

Past Occurrences

There have been no federal or state disaster declarations in the County due to localized flooding. The Agency noted the following past occurrences of localized flooding:

- Winters of 2016, 2017, and 2019 all saw above average precipitation levels each with incidence of atmospheric rivers or narrow corridors of intensely concentrated moisture hitting the Placer County area.

Vulnerability to and Impacts from Localized Flooding

Historically, much of the growth in the Agency and County has occurred adjacent to streams, resulting in significant damages to property, and losses from disruption of community activities when the streams

overflow. Additional development in the watersheds of these streams affects both the frequency and duration of damaging floods through an increase in stormwater runoff.

Primary concerns associated with stormwater flooding include life safety issues and impacts to property and to infrastructure that provides a means of ingress and egress throughout the community. Ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Objects can also be buried or destroyed through sediment deposition. Floodwaters can break utility lines and interrupt services. Standing water can cause damage to crops, roads, and foundations. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

Assets at Risk

Water management assets such as canal systems dams/reservoir and water side assets or access routes are all vulnerable to flood or flood debris, damage or resulting land or mudslides caused by flooding. Water damage liability claims and repairs may occur.

Landslide, Mudslide, Debris Flows

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

According to the California Geological Survey, landslides refer to a wide variety of processes that result in the perceptible downward and outward movement of soil, rock, and vegetation under gravitational influence. Common names for landslide types include slump, rockslide, debris slide, lateral spreading, debris avalanche, earth flow, and soil creep. Landslides may be triggered by both natural and human-induced changes in the environment that result in slope instability.

The susceptibility of an area to landslides depends on many variables including steepness of slope, type of slope material, structure and physical properties of materials, water content, amount of vegetation, and proximity to areas undergoing rapid erosion or changes caused by human activities. These activities include mining, construction, and changes to surface drainage areas. Landslide events can be determined by the composition of materials and the speed of movement. A rockfall is dry and fast while a debris flow is wet and fast. Regardless of the speed of the slide, the materials within the slide, or the amount of water present in the movement, landslides are a serious natural hazard.

Debris flows can also occur in some areas of the County and the Agency. These debris flows generally occur in the immediate vicinity of existing drainage swales or steep ravines. Debris flows occur when near surface soil in or near steeply sloping drainage swales becomes saturated during unusually heavy precipitation and begins to flow downslope at a rapid rate. Debris flows are also common during the rainy season in post fire areas.

Location and Extent

Landslides, mudslides, and debris flows can affect certain areas of the Agency. The CGS has estimated that the risk varies across the Agency and has created maps showing risk variance. This risk variance falls into multiple categories. These are discussed in Section 4.3.14 of the Base Plan. According to the Agency Planning Team, risk varies within the Agency range from moderate to high. The speed of onset of landslide is often short, especially in post-wildfire burn scar areas, but it can also take years for a slope to creep and fail. Catastrophic landslide duration is usually short, though digging out and repairing landslide areas can take extensive effort with continued instability being problematic. Known problematic areas that are considered high risk are surveyed and monitored by the Agency, but this cannot be geographically all encompassing.

The Agency has identified several locations where rockfall is problematic and have installed deep anchors for slope stabilization and rockfall nets to protect critical assets and equipment. An example is shown in Figure R-8 above the Hell Hold Dam Road.

Figure R-8 Rockfall Netting Above Hell Hole 2016

Source: PCWA

Recent slides have blocked asset roads and hampered operations by prolonging access and endangering those crossing or working in the area.

Past Occurrences

There have been no federal or state disaster declarations in the County from landslide. However, the Agency Planning Team noted three recent incidences of landslides. Figure R-9 shows a photo of the Blacksmith Flat Road. This was a slide that started in the winter of 2017. Blacksmith Flat Road is a Forest Service Road (FR-23.) The slide continues to hamper access to the upper reaches of the Middle Fork Project. It is considered an unpassable road and a safety hazard. As of the writing of this annex in early 2021, it is unsure when this road will be reopened.

Figure R-9 Blacksmith Flat Road Landslide 2017

Source: PCWA

Figure R-10 is a photo from the January 25, 2018 rockslide/landslide. I-Bay road was unsafe and blocked by slide debris, there was minor damage to an intake structure and the rock face had to be secured before opening the roadway. Interbay Road is owned and was repaired by the Agency under an insurance claim. Insurance coverage for access roads is no longer available to the Agency. The specific area is now secured by rock fall netting, but similar geology is present in multiple areas throughout the County. There are many bucolic roads that may have slide issues compounded by fires and big weather.

Landslide and debris flow hazards (not included in the Power System Project stated above under Flood Hazards) are under study or have not been specifically identified. The Water system does have eight smaller dams, reservoirs and levees. Many of the canal land and water easements are also located along slopes and in mountainous areas and are potentially susceptible to a damaging landslide event.

Figure R-10 Interbay Road Slide

Source: PCWA

Vulnerability to and Impacts from Landslide

Although landslides are primarily associated with slopes greater than 15 percent, they can also occur in relatively flat areas and as cut-and-fill failures, river bluff failures, lateral spreading landslides, collapse of wine-waste piles, failures associated with quarries, and open-pit mines. Landslides may be triggered by both natural- and human-caused activity. Canal systems were often built on hillsides with flumes crossing valleys. Failure points can occur with unstable soils, human encroachment into the embankment, rodent activity and/or may be triggered by storm systems, water inundation and organic materials that make their way into the canal system.

Impacts from landslide, mudslides and debris flow may include structures, infrastructure, and impacts upon life safety. When a canal system fails from landslide the damage ranges from a variation in water supply

for drinking water and firefighting, to crop failure from lack of irrigation. While the agency considers and builds in redundancies, canal system failures are considered extremely serious. In addition to Agency managed canals, canals from other operators such as PG&E and Nevada Irrigation District have delivery points into our water systems and are considered critical within the water supply chain.

Past Occurrences

Past occurrences include the Pulp Mill Canal in the winter of 2017 where a three-hundred and fifty foot section of a lined canal was damaged by erosion creating voids underneath the canal, causing leaks, instability of the canal, and ultimately a landslide failure undermining the canal and creating the entire section of the canal to slide down the hillside.

Figure R-11 Pulp Mill Canal 2017

Source: PCWA

In 2017, the Boardman canal had a slide in an unlined section of the canal that occurred above the canal. The slide blocked the flow of the canal as earthen debris from the slide ended up in the water way. Such a slide during major storms compounds water management with storm runoff only being controlled by spillways above the slide. This situation could compound additional failures and a loss of water supply.

Figure R-12 Boardman Canal

Source: PCWA

During the same winter a section of the Middle Fiddler Green canal had a two-hundred foot section of the lined canal start to erode away from the gunite lined edge of the canal. Any earth movement, sliding or erosion can create cracking and storm water infiltration into the supporting hillside.

This type of slide can be particularly concerning to homeowners in the area around the canal systems. Both failure and water from spill management can impact life safety, structures and infrastructure in the area.

While dams, reservoir, and levy failures have not occurred recently from slide damage, this does not mean that slides from above the bodies of water, and into water storage facilities could not occur. The Agency inspects and manages dams reservoirs and levies to known best practices and follow State Dam Safety requirements.

Assets at Risk

Much of the topography where Agency assets are located are on, above or below hillsides. Additionally the majority of operational hazards are at or along rivers or canal systems. All Agency assets with the exception of business offices would at some degree of risk from slides.

Pandemic

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to the World Health Organization (WHO), a disease epidemic occurs when there are more cases of that disease than normal. A pandemic is a worldwide epidemic of a disease. A pandemic may occur when a new virus appears against which the human population has no immunity.

A pandemic occurs when a new virus emerges for which people have little or no immunity, and for which there is no vaccine. This disease spreads easily person-to-person, causing serious illness, and can sweep across the country and around the world in a very short time. The U.S. Centers for Disease Control (CDC) and Prevention has been working closely with other countries and the WHO to strengthen systems to detect outbreaks of that might cause a pandemic and to assist with pandemic planning and preparation. An especially severe pandemic could lead to high levels of illness, death, social disruption, and economic loss.

Location and Extent

During a pandemic, the whole of the Agency, County, and surrounding region is at risk, as pandemic is a regional, national, and international event. The speed of onset of pandemic is usually short, while the duration is variable, but can last for more than a year as shown in the 1918/1919 Spanish Flu that by some estimates infected one-third of the population. There is no scientific scale to measure the magnitude of pandemic. Pandemics are usually measured in numbers affected by the pandemic, and by number who die from complications from the pandemic.

Past Occurrences

There has been one state and federal disaster declaration due to pandemic, as shown in Table R-8.

Table R-8 Placer County – State and Federal Pandemic Disaster Declarations 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Pandemic	1	2020	1	2020

Source: Cal OES, FEMA

The 20th century saw three outbreaks of pandemic.

- The 1918-1919 Influenza Pandemic (H1N1)
- The February 1957-1958 Influenza Pandemic (H2N2)
- The 1968 Influenza Pandemic (H3N2)

To date, the 21st century has seen two acknowledged pandemics.

- 2009 Swine Flu (H1N1)
- 2019/2020 COVID 19

Placer County Water Agency responded to the pandemic by following National, State and Local requirements for notifications, social distancing, cleaning, mask wearing and employee management including disease testing, leave policies, quarantine, and adapting workplace configurations up to and including the closure of certain non-essential facilities. The Agency leveraged technology setting many employees up to be able to work from home and setting up software for virtual meeting and collaboration space. While Agency employees were not considered amongst the food and agricultural section of critical employees for receiving vaccinations, the Agency understood that water is a critical resource that sustains life and the Agency is prepared to continue operations under pandemic circumstances.

Vulnerability to and Impacts from Pandemic

Pandemics have and will continue to have impacts on human health in the region. A pandemic occurs when a new virus emerges for which there is little or no immunity in the human population; the virus causes serious illness and spreads easily from person-to-person worldwide. There are several strategies that public health officials can use to combat a pandemic. Constant surveillance regarding the current pandemic, use of infection control techniques, and administration of vaccines once they become available. Citizens can help prevent the spread of a pandemic by staying home, or “self-quarantining,” if they suspect they are infected. Pandemic has not affected the buildings, critical facilities, or infrastructure in the Agency. Pandemic can have varying levels of impact to employees, and the Agency customer base depending on the nature of the pandemic.

Impacts could range from school and business closings to the interruption of basic services such as public transportation, health care, and the delivery of food and essential medicines. Hospitalizations and deaths can occur, especially to the elderly or those with pre-existing underlying conditions. As seen with Covid-19, multiple businesses were forced to close temporarily (some permanently), and unemployment rose significantly. Supply chains for food and essentials can be interrupted.

Assets at Risk

Pandemics do not typically destroy physical facilities, but can affect Agency personnel who operate Agency facilities. Additional deep cleaning and regular sanitization procedures were introduced following standard industrial hygiene practices. The operation of physical assets could be impacted as there is a level of knowledge for the operation of treated water, raw water, and water treatment plants as well as operation and maintenance of hydro-electric facilities. Inspections, maintenance, and capital investment may have been arrested to varying degrees and unknown impact on physical facilities. A loss of institutional knowledge can occur from death or retirements.

Severe Weather: Heavy Rains and Storms

Likelihood of Future Occurrence—Highly Likely

Vulnerability—Medium

Hazard Profile and Problem Description

Storms in the Agency occur annually and are generally characterized by heavy rain often accompanied by strong winds and sometimes lightning and hail. Approximately 10 percent of the thunderstorms that occur each year in the United States are classified as severe. A thunderstorm is classified as severe when it contains one or more of the following phenomena: hail that is three-quarters of an inch or greater, winds in excess of 50 knots (57.5 mph), or a tornado. Heavy precipitation in the Agency falls mainly in the fall, winter, and spring months in the western side of the County and primarily in the fall and spring in the eastern side of the County.

Location and Extent

Heavy rain events occur on a regional basis. Rains and storms can occur in any location of the Agency. All portions of the Agency are at risk to heavy rains. Most of the severe rains occur during the fall, winter, and spring months. There is no scale by which heavy rains and severe storms are measured. Magnitude of storms is measured often in rainfall and damages. The speed of onset of heavy rains can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of severe storms in California, Placer County, and the Agency can range from minutes to hours to days. Information on precipitation extremes can be found in Section 4.3.4 of the Base Plan.

Past Occurrences

There have been past disaster declarations from heavy rains and storms, which were discussed in Past Occurrences of the flood section above. According to historical hazard data, severe weather, including heavy rains and storms, can be an annual occurrence in the Agency. This is the cause of many of the federal disaster declarations related to flooding.

Big Storms years with atmospheric rivers occurred in 1982, 1983, 1995, 1997, and 2017. Storms in January and February of 2017 caused damage to multiple Agency facilities with the Flooding and Landslide Hazards listed above. In addition, damage to private property occurs from canal and water way overflows. This is

not accurately captured as it is considered “weather,” and an “Act of God” type of loss that falls on private insurance carriers when coverage is purchased by the citizenry.

Vulnerability to and Impacts from Heavy Rain and Storms

Heavy rain and severe storms are the most frequent type of severe weather occurrences in the Agency. These events can cause localized flooding. Elongated events, or events that occur during times where the ground is already saturated can cause 1% and 0.2% annual chance flooding. Wind often accompanies these storms and has caused damage in the past. Hail and lightning are rare in the Agency.

Actual damage associated with the effects of severe weather include impacts to property, critical facilities (such as utilities), and life safety. Heavy rains and storms often result in localized flooding creating significant issues. Roads can become impassable and ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Floodwaters and downed trees can break utilities and interrupt services.

During periods of heavy rains and storms, power outages can occur. These power outages can affect pumping stations and lift stations that help alleviate flooding. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Assets at Risk

Water conveyance, pumpstations and water treatment plants can be the hardest hit by winter storms.

Tree Mortality

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, and contribute to future fuel loads in forests surrounding communities. During extended drought, tree mortality is driven by a build-up in endemic bark beetle populations and exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events.

Location and Extent

Onset of tree mortality events can be relatively fast; however, conditions – such as high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas,

and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 - 40 dead trees per acre
- Orange depicting 5 -15 dead trees per acre
 - Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A number of Placer County areas were designated during this event and the majority of Placer County watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality, along with numerous Tier 1 High hazard “hot spots”. A map of these areas was shown in in Section 4.3.18 of the Base Plan.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015. No events of past tree mortality have affected the Agency. Tree mortality most often presents losses through damaged or falling trees during high winds or more significantly through wildfire size and intensity of Wildfire. See the Wildfire Hazard summary.

Vulnerability to and Impacts from Tree Mortality

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface with the forest. Trees in these interface areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead trees within the wildland urban intermix or wildland urban interface or urban areas therefore pose a greater risk to due to their proximity to residents, businesses, and road, power, and communication infrastructure.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure.

Tree mortality impacts the Agency in various ways. Wildfire intensity and size cannot be ignored. The Agency has almost two hundred properties in its property portfolio and additional easements and assets along 786 miles of delivery system. Not only do we have assets exposed, but the water supply system itself, is critical for fighting fire. The Agency maintains a strong presence with adjacent landowners, naturalist groups, forest services and the firefighting community.

In Power Systems, the dead trees and debris makes its way from the watershed into the rivers creating debris and large log hazards for dams and increased silt and sedimentation of the water ways. Large storms exacerbate tree mortality periods by increasing the hazards for dams and complicating water management.

Dead trees shed, fail, or die in place threatening the canal system or other assets with water blockages or canal failures. The dead trees can become an issue of contention between landowners and the Agency complicating easements and good will.

Assets at Risk

All Agency physical assets are at risk and as learned from the Camp Fire even underground water delivery systems can be damaged by the extreme heat of a wildfire. Most likely assets to sustain damages are dams, buildings, flumes and canal systems impacted by tree failure, debris or wildfire.

Wildfire

Likelihood of Future Occurrence—Highly Likely

Vulnerability—High

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the PCWA. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. In the past, the fire season extended from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas. A large part of the Agency service area is in the WUI.

Extreme Heat/Wildfire and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal

agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

Accidents to power distribution lines can occur from weather conditions or at random. One such random event of power failure struck the Agency on October 22, 2020. A vehicle struck a power line near Newcastle. The Agency was able to avoid major issues but noted that damages could have been extensive if the water treatment and distribution system ran dry. Without electricity the Agency cannot treat water. Fire services and potable water could have been adversely impacted.

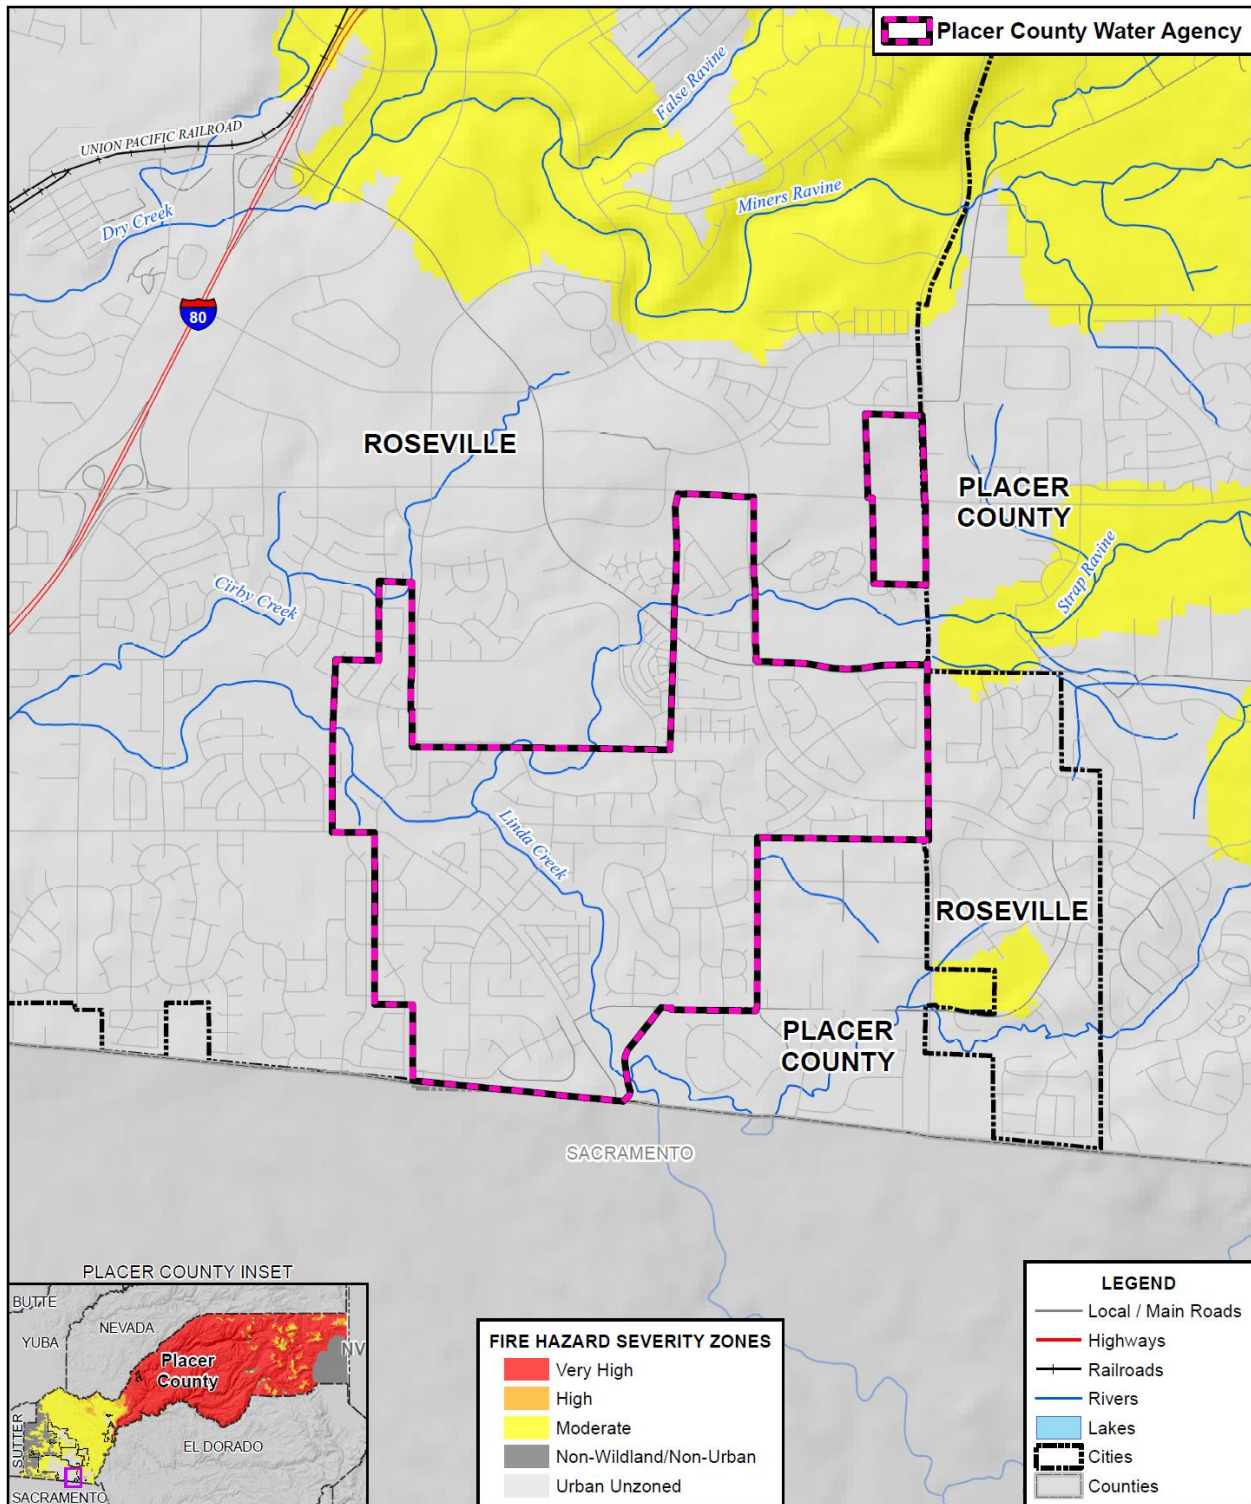

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a Public Safety Power Shutoffs (PSPS.) More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan. PSPS events are becoming common in the fall during high wind events. The Agency noted it have been affected by PSPS on September 8th and 9th of 2020; September 26th through September 28, 2020; October 25, 2020; and October 28, 2020. While the Agency has many backup systems, unintended consequences can occur when migrating to the backup system. Furthermore the general public has turned to small generators which create additional fire danger and pollution.

Location and Extent

Wildfire can affect all areas of the Agency. CAL FIRE has estimated that the risk varies across the Agency and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the PCWA were created. Figure R-13 shows the CAL FIRE FHSZ in the Agency. As shown on the maps, fire hazard severity zones within the Agency range from Non-Wildland/Non-Urban to very high hazardous wilderness areas on the Eastern side of the map.

Figure R-13 PCWA – Fire Hazard Severity Zones

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of high wind, drought or during or after hot dry summer months. Fires can burn for a short period of time or may have uncontrolled durations lasting for weeks or longer. Smoldering materials can last for months.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table R-9.

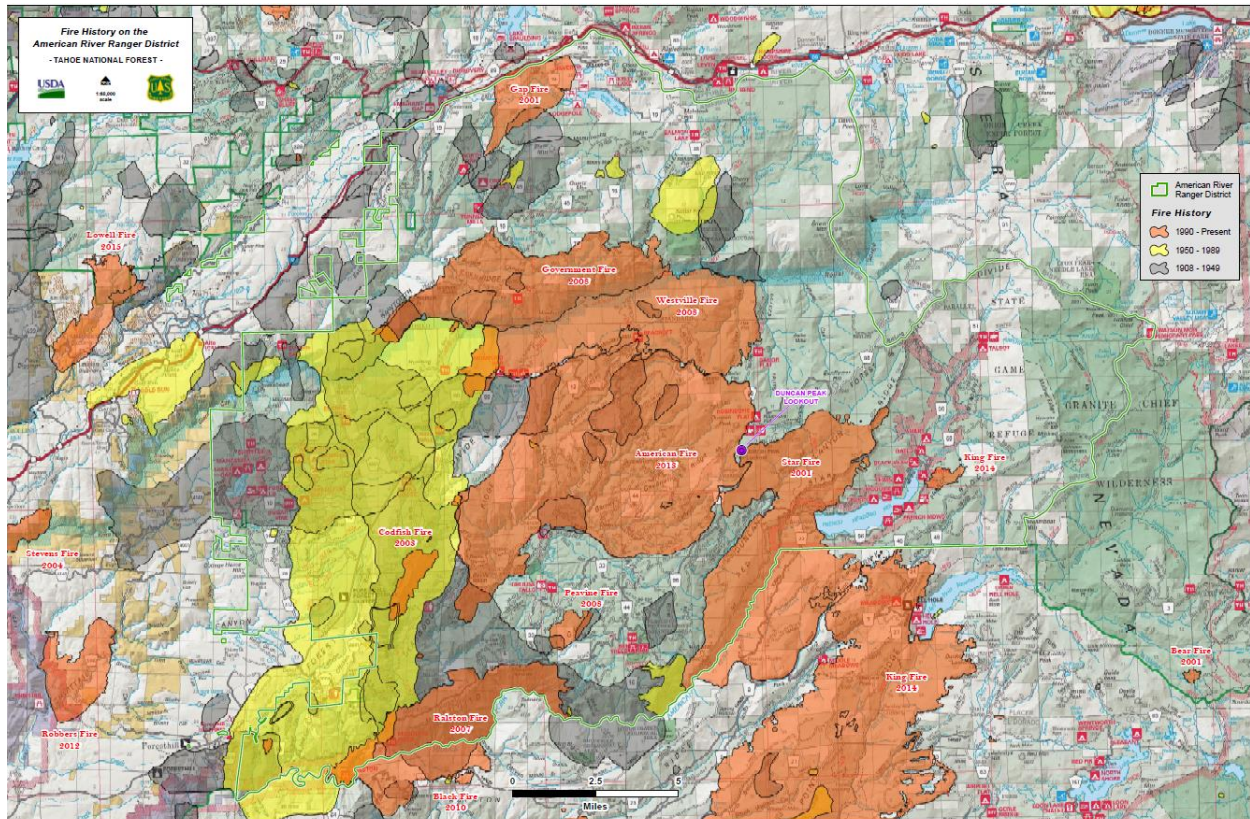

Table R-9 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

The Agency provided a map of fires that have occurred in and around PCWA territory. This is shown on Figure R-14.

Figure R-14 PCWA – Area Fires

Source: US Forest Service

The Agency also noted it was affected by a fire on September 8, 2020. A fire occurred in the El Dorado National Forest. Evacuations occurred in the area. Distribution power lines were shutdown which led to an electrical generation shut down. Damage values have not been fully calculated. The Agency noted that in the long term, wildfire debris, erosion and waterway damage typically plague the Agency years into the future.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the Agency from wildfire is of significant concern, with some of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with developed land and increasing population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As adverse climate changes and development continues throughout the County, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries, damage to structures and other improvements, the loss of natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the Agency. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the Agency by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality smoke and air pollution from wildfires can be a severe health hazard impacting the citizenry and employees.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

The top of the water shed (water supply system) is located in an area prone to wildfire. Assets include canals, flumes, treatment plants and water storage facilities. While flumes are typically “big timber” (see Figure R-15) they range in age and condition and could limit the flow of water through the water supply system. Emergency Services should give special consideration to water facilities because of the symbiotic working relationship. It is recommended that Emergency Services immediately work with the Agency during emergency situations.

Figure R-15 Traditional Big Timber Flume

Source: PCWA

The Power Project is in a wilderness area that is prone to wildfire. Facilities have been intelligently planned and have survived multiple fires but are still susceptible to damages that can be caused by wildfire. Primary weaknesses include access, communications, and power lines. Dorms, housing, campgrounds and recreational facilities are also more likely to combust. Water resources are used to assist with firefighting where applicable. Wildfire is a great risk for both water and power production.

Assets at Risk

The majority of Agency assets are in rural or wildland-urban interfaces (WUI,) areas which have historically taken the brunt of wildfires. The Agency would consider all assets at high risk of wildfire.

R.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

R.6.1. Regulatory Mitigation Capabilities

Table R-10 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the PCWA.

Table R-10 PCWA Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	Y 2021	Strategic plan approved by the Board considers sustainability and reliability of the Agency and system. Yes
Capital Improvements Plan	Y Annual	Capital Improvements are included in the Budget process and include risk and replacement annually. Yes
Economic Development Plan	N	See Placer County.
Local Emergency Operations Plan	N	See Placer County.
Continuity of Operations Plan	Y 2020	AWIA/FERC Emergency Action Plans.
Transportation Plan	N	See Placer County.
Stormwater Management Plan/Program	N	See Placer County.
Engineering Studies for Streams	N	See Placer County.
Community Wildfire Protection Plan	N	See Placer County.
Agency Rules and Regulations	Y	Rules, regulations, rates and charges governing the distribution and use of water.
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	N	Version/Year: See Placer County
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score: See Placer County
Fire department ISO rating:	N	Rating: Varies by property location.
Site plan review requirements	Y	Technical Services/Engineering for “water availability.”
Agency Rules and Regulations	Y	Rules, regulations, rates and charges governing the distribution and use of water.
Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
Zoning ordinance	N	See Placer County
Subdivision ordinance	N	See Placer County
Floodplain ordinance	N	See Placer County
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	See Placer County
Flood insurance rate maps	N	See Placer County
Elevation Certificates	N	See Placer County

Acquisition of land for open space and public recreation uses	Y	The Agency maintains recreation land as a part of the FERC Licensing Agreement.
Erosion or sediment control program	Y	Dam and asset inspection and monitoring.
How can these capabilities be expanded and improved to reduce risk?		
Regular risk assessment, planning and implementation of risk reduction measures are incorporated into various aspects of operations. The Agency has multiple cooperative partnerships to leverage these activities. Perhaps additional grant funding could accelerate risk reduction, but there is limited staff availability for grant writing.		

Source: PCWA

As indicated above, the Agency, in conjunction with Placer County, has several programs, plans, policies, and codes and ordinances that guide hazard mitigation. Some of these Agency-specific elements are described in more detail below.

Placer County Urban Water Management Plan, 2015

PCWA has prepared the Urban Water Management Plan (UWMP) to comply with the Urban Water Management Planning Act (UWMPA) requirements for urban water suppliers. This UWMP addresses PCWA’s water management planning efforts to ensure adequate water supply to meet demands over the next 30 years. The 2015 UWMP specifically assesses the availability of supplies to meet future demands during normal, single-dry and multiple dry years. The plan takes in consideration catastrophic interruption and drought. This plan can be found on the Agency website at: Environmental Planning & Compliance | pcwa.net

Placer County Water Connection Charge Plan (and Development Process)

The Water Connection Charge Plan facilitates development and standard specifications for residential and commercial water system design in the PCWA service area. Connection charges and water sales are administered per the plan. It can be located on the PCWA website: New Development Process | pcwa.net

R.6.2. Administrative/Technical Mitigation Capabilities

The Agency is governed by a five-member Board of Directors, elected to four-year terms by voters residing within five geographical areas of Placer County. The Board of Directors meets twice monthly in regular session and holds special meetings as needed.

The Board employs a General Manager to administer all Agency activities, services and employment, and in-house counsel to advise the Agency on legal and regulatory matters and retained counsel specific to advising the Board of Directors. The Agency staffs 230 full-time employees in total. About 74-employees work out of the Auburn Business Center. Departments include Administrative Services, Resource Development, Technical Services, Customer Services, and Financial Services. The Agency participates in the Placer County Local Hazard Mitigation Plan, the Placer County Emergency Operations Plan, and has a room set up to activate as an Agency Emergency Operation Center with radio, telecommunications, satellite phone service and A/V capabilities.

The Power Systems Office is located in Foresthill where operations are conducted for the Middle Fork Project. 35-employees manage the engineering, maintenance and operations of the hydro-electric system

which includes 4 dams, 3 diversions, 5 powerhouses and associated tunnels, penstocks and facilities. There are up-to-date Emergency Management Plans, FERC Emergency Action Plans, and a FERC Security Plan for the operations.

Drinking Water Operations are coordinated from offices located on Ferguson Road, across from the Business Center but utilize various treatment plants and water storage facilities. Drinking Water Operations consists of 38-employees who are directly involved in the production and distribution of treated drinking water. A team of water plant operators coordinate operation of eight water treatment plants. Water quality personnel interpret public health laws, monitor water to ensure its safety, perform necessary reporting to the USEPA and California Department of Health Services. Water treatment plant maintenance personnel maintain and repair all the water quality facilities including the treatment plants, pump sites and well sites. Water distribution operators route water through pipeline systems and manage a network of tanks, pumps and pressure-control stations. Drinking Water Operations maintains the Hazardous Materials Business Plan. The Risk Assessment and Emergency Response Plans meeting the America’s Water Infrastructure Act were completed in 2020.

Field Service has 68-employees who maintain 165-miles of canal and 616-miles of drinking water delivery systems. The Field corporate yard is located on Maidu Ave close to the edge of the American River Canyon. This yard houses the materials and heavy equipment required to maintain the raw and drinking water delivery systems.

Customer Services has a staff of 19-employees who provide a range of services including assisting the customer with all service related issues, service installations, new accounts, billing, payment processing, collections and water use efficiency. The department coordinates customer notifications during schedule maintenance projects and when water system emergencies arise (outages). Customer Services maintains an Agency Emergency Response Plan and an Interactive Voice Response (IVR) system for emergency notifications to the customer base.

The meter services crew conducts the agency’s meter reading, testing and replacement programs. Other activities include a cross-control program that prevents the reverse flow of water from private services back into the public water system and the constructed conveyance program that assists canal water customers in obtaining alternate water supplies for in-home use.

Table R-11 identifies the Agency department(s) responsible for activities related to mitigation and loss prevention in PCWA.

Table R-11 PCWA’s Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
County Wide Master Plan – Financial Assistance Program	Y	Loans or grants provided to districts for conservation and development of eligible water supplies and Facilities. Yes.
Placer County Urban Water Management Plan	Y	Addresses water demand and water supply
Water Connection Charge Plan	Y	Connection charges and development requirements.
Planning Commission	N	See Placer County

Mitigation Planning Committee	N	See Placer County
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	See Cal-Fire, Operations, Maintenance and cooperative agreements.
Mutual aid agreements	Y	The Agency has mutual aid agreements with other water/power entities for employees and equipment in the event of a disaster.
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	N	See Placer County
Emergency Manager	N	See Placer County
Community Planner	N	See Placer County
Civil Engineer	N	See Placer County
GIS Coordinator	N	See Placer County Coordinated with the Agency GIS Staff
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	N	See Placer County
Hazard data and information	N	See Placer County
Grant writing	N	See Placer County
Hazard analysis	N	See Placer County
Agency Customer IVR Reverse Notification System	Y	Agency system, effective for customer base notifications, adequately trained and staffed.
How can these capabilities be expanded and improved to reduce risk?		
The Agency has a close working relationship with the County for governance planning and emergency services.		

Source: PCWA

R.6.3. Fiscal Mitigation Capabilities

Table R-12 identifies financial tools or resources that the Agency could potentially use to help fund mitigation activities.

Table R-12 PCWA's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	N	Extensively used in projects described.
Authority to levy taxes for specific purposes	N	
Fees for water, sewer, gas, or electric services	Y	Used in Placer County for conservation.
Impact fees for new development	N	
Storm water utility fee	Y	Check?

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Incur debt through general obligation bonds and/or special tax bonds	N	
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	N	
State and Federal Hazard Mitigation Grants	Y	Used for Prevention, hardening or replacing infrastructure.
Facility Agreements	Y	Used for accepting compliant water infrastructure from development.
Insurance	Y	Used for replacement and stabilization of existing hazard conditions after loss.
How can these capabilities be expanded and improved to reduce risk?		
Many grant projects require expensive pre-planning for qualification. In some cases, this pre-work prevents acceptable grant applications. Grant applications and work require additional staffing in a very lean organization.		

Source: PCWA

R.6.4. Mitigation Education, Outreach, and Partnerships

Table R-13 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table R-13 PCWA's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Sierra-French Meadows Forest Restoration Partnership	Y	See items below this table.
Mountain Counties Water Resource Association	Y	See items below this table.
Urban Water Management Plan	Y	See items below this table.
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	See items below this table.
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	See items below this table.
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	Y	See items below this table.

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Other	Y	See items below this table.
How can these capabilities be expanded and improved to reduce risk?		
The Agency maintains many active partnerships and participates in a variety of strategic planning and outreach and will continue to do so. Some of this outreach is outlined below. Other things such as the joint Fire and Water annual community service publication focused on wildfire preparedness and water and forest conservation.		

Source: PCWA

PCWA has several partners in carrying out Agency objectives. These include:

Sierra-French Meadows Forest Restoration Partnership - The Sierra-French Meadows Forest Restoration Partnership Includes PCWA, Placer County, The U.S. Forest Service, the Nature Conservancy, The Sierra Nevada Conservancy, The American River Conservancy and UC Merced SNRI all working together to make the forest healthy and more resilient. Located in the headwaters of the Middle Fork American River, in the Tahoe National Forest, the Project aims to restore forest health by reducing high-severity fires across 28,000 acres of critical watershed, and to study the effects of forest treatments on ecosystem health. [FrenchMeadowsLessons_2019.pdf \(scienceforconservation.org\)](#)

Mountain Counties Water Resource Association – The Mountain Counties Water Resource Association seeks to educate state, local and federal decision-makers on the issues facing water agencies in the region. These issues include long-term sustainability through many of the hazards within this plan. [Mountain Counties Water Resources Association](#)

Urban Water Management Plan – The Urban Water Management Plan (UWMP) unifies planning for California watersheds into watershed area plans, considering the entire watershed and the more geographically far-reaching impacts of water.

River Arc – River Arc seeks to improve water reliability in the Sacramento region using surplus water from the American River and sustaining ground water reserves to refill groundwater basins during wet years in collaboration with area water providers. [www.riverarcproject.com](#)

Regional Water Authority – The RWA is a joint powers authority, formed to serve and represent regional water supply interests and to assist its members in protecting and enhancing the reliability, availability, and quality of water resources. A part of the mission is to address the impact of climate change on water supplies and kickstart the Sacramento Regional Water Bank for sustainable water storage and recovery. The Authority is comprised of both public and private partners. PCWA is a member and supporter of RWA. [RWA \(rwah2o.org\)](#)

Water Education Foundation – The Water Education Foundation is an impartial non-profit organization which develops and implements education programs leading to a broader understanding of water issues and to the resolution of water problems. The Agency supports the Foundation and its mission.

County of Placer – PCWA is a supporter of the Placer Legacy program. The Agency has been asked by the US Fish & Wildlife Service to participate in the development of an HCP/NCCP “Natural Communities Conservation Plan” in part to mitigate for the potential secondary impacts of the growth that could be enabled by the continued development of the Agency’s existing water rights.

Sacramento River Watershed Program – The SRWP represents a wide coalition of stakeholders who care about the quality of the water and quality of life in the Sacramento River Watershed. Areas of emphasis include monitoring toxic pollutants, public outreach and education, and biological and habitat preservation. The Agency is studying the feasibility of a Sacramento River diversion in exchange for an equal release of its water right water in the American River. The Agency’s proposed Sacramento River diversion project would be consistent with the SRWP goals and objectives. [Sacramento River Watershed Program \(sacriver.org\)](http://sacriver.org)

The United States Forest Service – Is a Federal Agency under the US Department of Agriculture responsible for administering National Forests and Grass Lands which include the Tahoe and El Dorado Forest. PCWA enjoys a strong relationship working alongside the Forest Service as our facilities and watersheds are intermingled.

The United States Bureau of Reclamation – Is a Federal Agency under the US Department of the Interior which oversees water resource management specifically as it applies to the oversight and operation of diversion, delivery and storage and hydroelectric projects. The USBR still has an interest in the American River at the former site of the Auburn Dam.

The State Department of Parks & Recreation – Auburn State Recreation Area – The Auburn State Recreation Area is a part of the California Department of Parks and Recreation. They are responsible for the conservation and management of approximately 20-miles of park along the confluence of the American River.

Federal Energy Regulatory Commission (FERC) – Is an independent government agency that regulates the generation and transmission of energy, and more specifically licenses the Middle Fork Hydroelectric Project.

Pacific Gas & Electric Company (PG&E) – PG&E is a utility company delivering energy services to Northern and Central California. PG&E has multiple land, operational and watershed connections with PCWA.

Cal-Fire – Is a major incident management responder, providing varied emergency services. Cal-Fire has both State and Local responsibilities and is a primary responder to wildland fire in the Placer/El Dorado Area. PCWA has a working relationship with Cal-Fire that includes water and the sharing of with other Agency resources.

Protect American River Canyons (PARC) – PARC is a community-based non-profit organization located in Auburn that is dedicated to building American River community through collaboration and protection of the natural, recreational and historical resources for the North and Middle Forks of the American River Watershed.

Department of Water Resources – DWR’s mission is to manage the water resources in California in cooperation with other agencies, to benefit the State’s people, and to protect, restore, and enhance the natural and human environment. PCWA coordinates with DWR on groundwater monitoring in west Placer County, interstate water resource negotiations regarding the Truckee River system, and on other regional issues.

Water Forum – The Water Forum was a collaborative process of a diverse group of business and agricultural leaders, citizens groups, environmental interests, water managers and local governments in Sacramento County, Placer County, and El Dorado County, with the co-equal objectives to (a) provide a reliable and safe water supply for the region’s economic health and planned development to the year 2030, and (b) preserve the fishery, wildlife, recreational, and aesthetic values of the Lower American River. Implementation of the Water Forum Agreement will continue under the WF Successor Effort for many years.

Regional Water Authority – The RWA is a joint powers authority, formed to serve and represent regional water supply interests and to assist its members in protecting and enhancing the reliability, availability and quality of water resources. PCWA is a member and supporter of RWA.

City of Roseville – PCWA provides water from its Middle Fork American River Project (MFP) to the City. PCWA also has several interconnections between its treated water system and the cities that enable each to help the other in emergencies.

San Juan Water District – PCWA provides water from its MFP to the Agency to supply its customers within Placer County. PCWA also has several interconnections between its treated water system and the San Juan’s that enable each to help the other in emergencies.

Nevada Irrigation District – NID and PCWA have common watershed and multiple interconnections that can be used to support water service.

R.6.5. Other Mitigation Efforts

The Agency is involved in a variety of mitigation activities including public outreach and project activities. These mitigation activities include:

- Public Service Advertisements www.pcwa.net
- Water Conservation (public outreach) program www.pcwa.net
- Website Newsletters to the general public www.pcwa.net

The Agency Water Conservation Program includes residential programs and rebates for: high efficiency clothes washing machines, high efficiency toilets, hot-water recirculation systems, point of use hot water heater, new lawn replacement pilot program, free mulch distribution, and water wise house calls. Commercial programs include customer recognition for conservation (Flume Awards) and rebates including high efficiency toilet rebate program, waterless urinal rebate program, water wise business calls & large landscape irrigation survey for information on these and other programs customers may visit the PCWA Web site and visit the Customer Service section for the Water Use Efficiency pages at www.pcwa.net.

Field Services Canal Guniting Projects – Lining earthen canals with gunite prevents soil bank erosion and water loss from seeping into the ground. Cracks and repairs to gunite have to be maintained as roots and earth movement cause areas of entropy. This work conserves water loss and is increasingly important during prolonged drought. Ongoing in capital planning budgets and operations. one-million per year.

Emergency guniting was done for the Middle Fiddler Green & Pulp Mill canals when 2017 Storms caused heavy losses this was paid from FEMA Claims & internal emergency funding.

Hillside Slope Stabilization to prevent landslide - Rockfall anchors and netting were installed at Interbay Road in January of 2018 when a slide blocked safe access to the Middle Fork Powerhouse. Insurance funded preventative actions and repair of the area so that the road could be reopened. PCWA has spent some \$4-Million in rock fall mitigation over the last 7-years.

Hell Hole Dam Core Raise - In 2020 PCWA raised the impervious core of the Hell Hole Dam to increase water capacity, for drought and flood control, and to strengthen the dam against catastrophic storm failure. The project was an internally funded Capital Project.

French Meadows Forest Fire Restoration Project - Is a community partnership founded to reduce high-severity wildfires and promote watershed restoration. The French Meadows partnership restored forest health to 1,066 acres of critical headwaters in the first year of the French Meadows Forest Restoration Project reducing stand density by over 30% and harvesting over 3 million board feet of timber. This prevented a loss of unique wet meadow habitat critical for reducing the intensity and spread of wildfire.

Wooden Flume Replacement – Flumes are a critical part of the canal system carrying water across valleys and ravines in a gravity fed canal system. The Agency seeks to replace wooden flume structures where practical to prevent wildfire and hazardous materials service interruptions. Long Ravine, Secret Town, Penryn #1 Fumes put into pipe through internal Capital plans and spending.

American River Pump Station – The American River Pump Station allows the Agency to draw water from the American River that is a critical supply in drought conditions. The intake and lower structures were severely damaged by the 2017 flooding/storms. The area and structures needed both hardening against future damage and repair. This was funded by FEMA Claims & internal funding for continued service.

Water System Interties – Multiple water system Interties increased redundancy of water supply should any of the hazards cause disruption to the water treatment or delivery system. Between 2017-2019, three Capital Projects were completed in conjunction with the Nevada Irrigation District. The Mt. Vernon, Locksley Lane and the Live Oak Interties are all functional interties between water systems.

Vegetation Management & Brushing – Vegetation Management and brushing has taken on a higher priority due to the frequency, intensity and prolonged wildfire season. Multiple projects have been completed with operational funding, capital funding and community partnerships with Cal-fire assistance.

- ✓ Vegetation Management & Brushing of the surrounding area of the Maidu Field Office through the Canyon Fire Resiliency Project 2020 Agency Capital funding and partnership
- ✓ Vegetation Management & Brushing below American River Pump Station power lines was funded by 2020 Agency operational funding

- ✓ 2019 Monta Vista Treatment Plant was thinned and brushed in cooperation with Cal-Fire and adjacent landowners to ensure water storage would be safe from wildfire and treefall. This was accomplished with operational funding and partnership with Cal Fire.
- ✓ In 2015, 33-acres around Lake Arthur were cleared and brushed in partnership with Cal-Fire and local landowners.
- ✓ 2016/17, 78 acres around Lake Theodore were cleared and brushed in partnership with Cal Fire and local landowners
- ✓ A Vegetation Management & Brushing project was completed on a large plot of un-developed Agency Land on Bill Francis Drive. The project was completed with a Cal-Fire partnership.

Debris, sedimentation de-silting projects – Debris, sedimentation and de-silting projects are important for dam safety enhancing the water storage capacity and removing debris that can cause problems for the safe operation of the dam. In addition, the de-silting adds water capacity for water storage and drought management. In 2016, 2017 and 2018 Emergency and Capital projects were completed for Ralston Afterbay, and the North & South Fork Diversions.

Dam management - The Mammoth reservoir low level outlet was replaced with an automated valve in 2020. The replacement allowed for automated operation to enhance water management for storms and water storage. This was an Agency capital project.

R.7 Mitigation Strategy

R.7.1. Mitigation Goals and Objectives

The PCWA adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

R.7.2. Mitigation Actions

The planning team for the PCWA identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Agriculture Pests and Diseases
- Avalanche
- Climate Change
- Dam Failure
- Drought & Water Shortage
- Floods: 1%/0.2% annual chance
- Floods: Localized Stormwater
- Landslides, Mudslides, and Debris Flows
- Pandemic
- Severe Weather: Heavy Rains and Storms

- Tree Mortality
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Develop Operable Dam Spillway Gates at Hell Hole Reservoir

Hazards Addressed: Dam Failure, Severe Weather, Flooding and Drought Water Supply

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: This project will improve Hell Hole's currently uncontrolled spillway. The improvements will allow capture of approximately 6,000 acre-feet of additional water that would otherwise escape over the spillway. This project increases the water storage and allows greater control of reservoir water levels during severe weather, flooding and drought conditions as well as adding a level of dam safety through management of the spillway.

Project Description: The project will install operable gates on the currently fixed spillway at Hell Hole Reservoir. Being able to keep the gates lowered during winter will preserve the current mode of safe reservoir operation during winter. Raising the gates in spring will allow capture of spring runoff that would otherwise escape over the spillway.

Other Alternatives: Do nothing.

Existing Planning Mechanism(s) through which Action Will Be Implemented: The project was identified when preparing PCWA's new license application for the Middle Fork American River Hydropower Project. Construction, operation, and maintenance will be performed by Placer County Water Agency (PCWA).

Responsible Agency/ Department/Partners: PCWA

Cost Estimate: \$5,000,000

Benefits (Losses Avoided): Impounded water will be available to users first within the county and secondarily outside the county. During droughts this water will bolster the supply.

Potential Funding: Middle Fork Finance Authority Capital

Timeline: Completion in 2025

Project Priority (H, M, L): High

Action 2. Alternate Intake for Alta Water Treatment Plant

Hazards Addressed: Severe Weather: Heavy Rains & Storms, Freeze & Snow, Drought & Water Shortage

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: The Alta Water Treatment Plant receives its source water from the PG&E Alta Powerhouse Intake and is susceptible to spills within the intake structure house, oil, solvents and other chemicals that may be in the building. Also, in the event of a fuel spill that impacts the Towle Canal, water needs to flow from the canal, through Alta Forebay, then to the PG&E powerhouse intake, a process that may take several days. Alta forebay is also susceptible to freezing, impairing water flow to the treatment plant.

Project Description: This project will install a structure and piping to allow for the raw water inflow to the treatment plant to come from Towle Canal, near the point where the canal enters Alta forebay.

In the event of a fuel, or other contamination in the Towle canal, raw water supply can be restored to the treatment plant after the water in Towle canal has been deemed safe, a much shorter time period than waiting for the contamination to be removed from Alta forebay.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: PCWA Capital Improvement

Responsible Agency/ Department/Partners: PCWA Technical Services. PG&E

Cost Estimate: \$ 450,000

Benefits (Losses Avoided): Restoration of water supply to Alta WTP in a shorter period of time; water supply in the event of the forebay freezing over, water supply in the event there is an issue with the PG&E intake structure.

Potential Funding: HGMP grant funding, State grant funding, PCWA CIP budget

Timeline: Undetermined, unfunded.

Project Priority (H, M, L): Medium

Action 3. Canal Access for Fire Fighting and water source

Hazards Addressed: Wildfire, Drought and Water Shortage

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The area east of the City of Auburn is comprised of many rural communities, receiving water from small water systems, PCWA canals, or wells.

In many of these areas, fire equipment cannot cross canal to access or escape fires. This project will work in conjunction with local fire agencies and Cal-Fire to determine locations along the canal where having the ability to access with fire equipment to cross the canals, or access the canals as a source of water for fire suppression.

Project Description: This project will cooperate with local fire agencies and Cal-Fire to determine locations where canal crossings are desired, and locations that are suitable as a water source for fire suppression equipment.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: PCWA Capital Improvement

Responsible Agency/ Department/Partners: PCWA Technical Services

Cost Estimate: \$500,000

Benefits (Losses Avoided): Fire equipment will have designated locations to cross canals, reducing the potential of causing damage to the canals, hence reducing the water supply to PCWA and private WTP's. Further, fire personnel will know where and how to access a reliable water supply, minimizing the potential of contaminating the water within the canal.

Potential Funding: HGMP grant funding, State grant funding, PCWA CIP budget

Timeline: Undetermined, not studied or funded

Project Priority (H, M, L): M

Action 4. Back-up and Stand-By Power Generation for critical community drinking and fire suppression water supply.

Hazards Addressed: Mukti-hazard (Agriculture Pests and Diseases, Avalanche, Climate Change, Dam Failure, Drought & Water Shortage, Floods: 1%/0.2% annual chance, Floods: Localized Stormwater, Landslides, Mudslides, and Debris Flows, Pandemic, Severe Weather: Heavy Rains and Storms, Tree Mortality, and Wildfire). Natural or intentional interruption of primary power supply to critical facilities providing community drinking and fire suppression water.

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: After the 2018 Camp Fire, the most destructive and deadly wildfire in California history, PG&E and other electrical utilities implemented Public Power Safety Shutoffs (PSPS) to help prevent wildfires during high, dry, wind events that typically occur in the fall, from arcing or downed power lines.

For PCWA, these PSPS events typically occur during PG&E fall maintenance activities on their canals and powerhouses, effectively eliminating the PG&E water supply to PCWA.

PCWA utilizes pumping from the American River during these maintenance outages to supplement and/or replace this water supply.

PG&E has told PCWA that they will not be creating micro-grids or provide mobile power generation to keep critical PCWA water supply facilities powered during PSPS events.

Project Description: Project will identify the critical PCWA facilities that do not have stand by power generation and determine the best solution to provide power during any power interruptions.

Other Alternatives: None. These facilities are critical for the continued, uninterrupted, water supply for the PCWA service area, and when available, water supply for adjacent water suppliers

Existing Planning Mechanism(s) through which Action Will Be Implemented: Capital budgets and grant funding.

Responsible Agency/ Department/Partners: PCWA Technical Service and Drinking Water Operations, and coordination with PG&E

Cost Estimate: \$5,000,000

Benefits (Losses Avoided): Uninterrupted water supply to the PCWA service area, including PCW's largest service area supplying water to 161,750 persons and fire hydrants

Potential Funding: PCWA and grant funding

Timeline: 2 to 10 years

Project Priority (H, M, L): High

Action 5. Lake Arthur Pumping Station

Hazards Addressed: Flooding, Drought & Water Shortage, Severe Weather, Wildfire. Increases reliability of water supply

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: In the event of a PG&E canal failure west of the Lake Arthur, the primary water supply to PCWA from PG&E is eliminated or significantly reduced. Fuel spills from vehicles or trains that enter PCWA and/or PG&E canals can also reduce the water supply to PCWA.

Water supplies to PCWA are also reduced during annual maintenance activities on PG&E canals.

Project Description: The Boardman canal traverses the hillside approximately 40 feet above and 100 feet away from Lake Arthur. The installation of one or more pumps will provide access to more than 80 acre feet of water into the Boardman canal, hence the Auburn, Foothill and Sunset water treatment plants.

Other Alternatives: Release water from Lake Arthur into Rock Creek Reservoir for potential release into the PG&E canal system, if available.

Existing Planning Mechanism(s) through which Action Will Be Implemented: PCWA Capital Improvement

Responsible Agency/ Department/Partners: PCWA Technical Services

Cost Estimate: \$ 850,000

Benefits (Losses Avoided): Access to additional water supply at a location that would benefit the upper PCWA raw water system and Auburn WTP.

Potential Funding: HGMP grant funding, State grant funding, PCWA CIP budget

Timeline: Unknown, not currently funded

Project Priority (H, M, L): Medium

Action 6. Monte Vista Spill Improvements and Cedar Creek Canal Encasement in Pipe

Hazards Addressed: Severe Weather, Flooding, Landslide prevention of canal failure,

Goals Addressed: 1, 2, 3, 4, 5, 7

Issue/Background: With climate change, precipitation events are expected to increase in intensity and in amounts of precipitation in the form of rain. The Cedar Creek Canal intercepts sheet flows and debris from these precipitation events and conveys them to the Monte Vista spill; automation of this spill will regulate the amount of flow allowed to continue within the Cedar Creek Canal, releasing excess flows to Canyon Creek. Automation will also remove large debris from the water, preventing the debris from entering the Gold Run pipe, potentially causing a blockage in the pipe, causing water to backup and overflow at the pipe inlet.

Cedar Creek Canal in an open canal traversing a sheer cliff above interstate 80 and alongside the Union Pacific Railroad, if debris become lodged in the open canal, or on the trash rack at the head of the Gold Run Pipe, water can back up, overtopping the canal, eroding the cliff onto interstate 80 or impairing the Railroad.

Project Description: This project will automate the Monte Vista Spill to regulate the flows into the spill and into the Gold Run Pipe. The project will also encase the Cedar Creek canal between Monte Vista Spill and the head of the Gold Run Pipe, approximately 1,900 feet. A detailed description of the project can be found in the 2019 FEMA pre-disaster mitigation grant application.

Other Alternatives: None that will provide the same results as what is proposed above.

Existing Planning Mechanism(s) through which Action Will Be Implemented: PCWA Capital Improvement

Responsible Agency/ Department/Partners: PCWA Technical Services

Cost Estimate: \$3,006,000

Benefits (Losses Avoided): Interruption of traffic on West bound interstate 80 for an unknown period of time to clear debris and restore canal connectivity; interruption to commerce and travel on the nearby railroad tracks; elimination of the raw water supply to four PCWA and several private water treatment plants.

Potential Funding: HGMP grant funding, State grant funding, PCWA CIP budget

Timeline: Unknown, 50% design of pipeline portion, not currently funded.

Project Priority (H, M, L): High

Action 7. Pulp Mill Canal Pipeline Encasement

Hazards Addressed: Drought, Severe Weather, Wildfire, Landslide.

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The northern section of the Pulp Mill Canal traverses the side of a hill below the Southern Pacific Railroad tracks. After two prolonged, heavy precipitation events in 20xx and 20xx, the hillside became saturated, causing the soils under the canal and flumes to slip out, resulting in canal failure. The canal could not be repaired until the water content of the soils allowed for construction equipment to access the area and gunite placed.

Project Description: This project would eliminate the north section of the Pulp Mill canal by connecting a new pipeline to the existing pipeline on the south side of interstate 80, continue west along Casa Loma Road, turn north at the Interstate 80 underpass for Alta Bonneybrook Road, and continue to Lake Alta.

Other Alternatives: Pipe the existing Pulp Mill Canal from exit of the existing Interstate 80 undercrossing to Lake Alta. This alternative does not mitigate the potential of the hillside failing from over saturation during large precipitation events that are expected to occur with increasing frequency due to climate change.

Existing Planning Mechanism(s) through which Action Will Be Implemented: PCWA Capital Improvement

Responsible Agency/ Department/Partners: PCWA Technical Services

Cost Estimate: \$2,500,000

Benefits (Losses Avoided): Eliminates the potential of canal failure, reduces potential of damage from train derailment and associated fluid spill from train.

Potential Funding: HGMP grant funding, State grant funding, PCWA CIP budget

Timeline: Unknown, unfunded.

Project Priority (H, M, L): H

Action 8. Permanent Pumps in Rock Creek Reservoir (PG&E Reservoir)

Hazards Addressed: Drought, Severe Weather, Dam Safety, Drought, Water reliability

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Currently, water can only be pumped from Rock Creek Reservoir by installing temporary pumps into the Wise Canal below the reservoir outlet. Reservoir outlet flow must be adjusted to match the temporary pump capacity to prevent flows from continuing in the Wise canal, affecting downstream activities.

These pumps take time to rent, install, and adjust, installation of permanent pumps will provide a ready water supply at any time needed.

Project Description: Project would install three to four pumps of varying capacity or variable speed, into a deep section of Rock Creek Reservoir, pumping water into the PCWA Middle Fiddler Green Canal, providing a water supply to NID and PCWA canals and potentially to the PCWA Foothill and Sunset water treatment plants. A fish exclusion screen would also be installed at the suction of each pump.

Other Alternatives: Purchase temporary pumps and crane system to allow for the pumps to be lowered into Wise Canal in a shorter time period than the current method.

Existing Planning Mechanism(s) through which Action Will Be Implemented: PCWA Technical Services Capital Improvement Plan

Responsible Agency/ Department/Partners: PCWA Technical Services, Field Services, Drinking Water Operations. Partners with NID, PG&E, FERC, and CDFW

Cost Estimate: \$5,000,000

Benefits (Losses Avoided): Additional water source in the event of a PG&E or PCWA canal failure, Drought, PG&E water reductions, severe weather

Potential Funding: HGMP or State grant funding, PCWA CIP

Timeline: Unknown, concept and temporary practice currently.

Project Priority (H, M, L): H

Action 9. Vegetation Management at PCWA Wooden Flumes

Hazards Addressed: Wildfire, Tree Mortality, Severe Weather, water reliability.

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The PCWA raw water conveyance system east of the City of Auburn, generally along the Interstate 80 corridor. Water is conveyed across ravines and small valleys using flumes with timber frame understructures. Many of these flumes are in heavily wooded, brushy, remote areas.

In the event of a wildfire, there is the potential that the understructure of the flumes could be damaged, causing the canal to spill its contents, potentially creating additional damage to the surrounding area. Further, the water supply to PCWA and private treatment plants is reduced or eliminated, reducing treated water storage, hence water supply to fire hydrants.

Project Description: This project would significantly reduce the amount vegetation within 200 feet of the flume, then remove less vegetation an additional 300 feet to either side of the flume and 1,000 feet up and downstream of the flume, along the alignment of the canal. There are 17 timber frame flumes for this project. A project description available upon request.

Other Alternatives: Remove only vegetation within 10 feet of the canal. No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: PCWA Capital Improvement

Responsible Agency/ Department/Partners: PCWA Technical Services

Cost Estimate: \$500,000

Benefits (Losses Avoided): At the conclusion of the project, each flume will have a defensible space that firefighting efforts can be implemented with minimum hazard to the flume and personnel. Water supplies to PCWA and private treatment plants remains uninterrupted.

Potential Funding: HGMP grant funding, State grant funding, PCWA CIP budget

Timeline: Ongoing

Project Priority (H, M, L): High

Action 10. Enhance Canals by Converting Earthen Canals to Gunite-Lined Canals in Critical Areas.

Hazards Addressed: Drought/Landslide-Debris/Hazardous Materials/Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: In 2011 a PG&E's Canal failed sliding off a hillside and causing water rationing and irrigation water shortages. Unlined dirt canals also lose water through seepage intensifying drought situations. Rodents can cause earthen canal failures through burrowing. Canals can be damaged by wildfire with more of a tendency to slide. Firefighting is also dependent on a consistent water supply.

Project Description: PCWA has an on-going capital improvement fund for lining canals, but there are more than 177 miles of canal with most originating in the 1800s. The Agency funds \$1-million a year to gunite a little less than two miles a year.

Other Alternatives: Some sections are put into pipe.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Ongoing operational maintenance, improvements, and capital spending.

Responsible Agency/ Department/Partners: PCWA

Cost Estimate: Approximately \$96 a foot on average

Benefits (Losses Avoided): Water shortages impacting water supply, operations and revenue. Canals intersect highways and rail-lines where a disruption failure could cost millions per hour in delayed commerce.

Potential Funding: Agency capital and operational budgets, grants to supplement?

Timeline: Annually complete approximately two miles or 10,560 feet a year

Project Priority (H, M, L): High

Action 11. *Wildfire prevention or Wildfire firefighting enhancements.*

Hazards Addressed: Wildfire and first responder enhancements

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: PCWA has operations spanning across multiple state, local and federal forests with a history of wildfire. There has always been a strong interest in being a cooperative agency in conjunction with fire and emergency services.

Project Description: There are multiple concepts that can potentially be developed for fire prevention or fire suppression support including: transformer-yard fire barriers or extinguishment, additional locations for fire cameras, water access enhancements, wildfire or emergency evacuation-areas, equipment staging areas, public emergency communications enhancements and aviation and rescue enhancements. (landing areas.)

Other Alternatives: Unknown

Existing Planning Mechanism(s) through which Action Will Be Implemented: Some ideas are internal to the Agency others may be cooperative partnerships.

Responsible Agency/ Department/Partners: Dependent of specific projects and stakeholders

Cost Estimate: Unknown, unstudied

Benefits (Losses Avoided): Life safety and wildfire prevention or

Potential Funding: Unknown at this point

Timeline: Unknown at this point

Project Priority (H, M, L): M

Action 12. Replace Wooden Flume Structures

Hazards Addressed: Wildfire and Drought

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Wooden flumes are subject to destruction from natural elements and wildfire. The flumes are critical connections in a gravity fed canal system running through valleys and from hill to hill. Flumes are critical for the stability of the water supply for both domestic water and irrigation water.

Project Description: Canals run into pipe rather than flumes have less of a probability of failing and have a greater chance of surviving wildfire.

Other Alternatives: Undergrounding pipe and pumpstations

Existing Planning Mechanism(s) through which Action Will Be Implemented: Capital budgets as priorities allow. Three flumes have been piped or encased, 30 more exist as wooden structures.

Responsible Agency/ Department/Partners: PCWA

Cost Estimate: \$12-million plus

Benefits (Losses Avoided): \$2.7-million in replacement value at risk without considering subsequent losses including water supply and firefighting.

Potential Funding: Agency Capital funding & grants

Timeline: One every five years? 150 Years?

Project Priority (H, M, L): High

Action 13. Reservoir - dam capacity and water management improvement projects.

Hazards Addressed: Dam Failure, Flooding, Drought, Severe Weather and Climate Change

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The Agency has 16-reservoirs of varying size and hazard, all with water regulating appliances such as a dam, spillway, checkboard system or low-level outlet for the control of water. Over time reservoirs collect sedimentation displacing storage capacity and creating challenges rising water levels or water management devices. Almost any reservoir improvement quickly becomes a large capital project. Particularly hazardous is debris from wildfires that threaten the dams or spillways.

Project Description: Sedimentation removal, dam or spillway projects or maintenance, improving capacity or increasing safety, water management, and water storage.

Other Alternatives: Accept the risk of severe outlying hazards beyond current experience.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Capital improvement projects.

Responsible Agency/ Department/Partners: PCWA in partnership and cooperation of DSOD and FERC

Cost Estimate: Many of the projects are undetermined and require study.

Benefits (Losses Avoided): Improved dam safety and water management

Potential Funding: Capital Improvement Funds

Timeline: Undetermined, may arise from inspections, and requires study and project specifications

Project Priority (H, M, L): M

Action 14. Rockfall anchoring, stabilization, rockfall netting and slide debris mitigation.

Hazards Addressed: Landslides, mudflows & debris flow. Severe Weather and Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The Agency has had multiple slides blocking access routes to operational and wilderness recreational areas or areas where existing roads have fallen off the mountainside. While we have done extensive geological studies and stabilized hillsides above many of our assets, wildfires and extreme storms create dynamic slide conditions. There are areas where existing slides that have destroyed or blocked roadways and need to be cleaned up for emergency and fire access.

Project Description: Continue to study and identify locations where roads and facilities may be at risk for earth movement and address with anchoring, stabilization and rockfall netting. Where roadways are

blocked, clear debris from roadways and stabilize the remaining hillside. In some cases the hillsides below roadways need to be stabilized.

Other Alternatives: Do nothing and spend money clearing roadways after a slide.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Existing Blacksmith Flat Road, Mosquito Ridge Road slide could be done in cooperation between the Forest Service and perhaps facilitated with grant funding.

Responsible Agency/ Department/Partners: Arrangements with the roadway owners, Forest Service and others along with grants and Capital funding for PCWA owned roadways.

Cost Estimate: Typically, one to fifteen million per location

Benefits (Losses Avoided): Increases access for fire services, recreation, and Agency operations

Potential Funding: Depends on the roadway ownership.

Timeline: As studied, identified, and needed.

Project Priority (H, M, L): Priority assigned dependent on the criticality of the area. Existing slides are H.

Action 15. Zone 3 Automation

Hazards Addressed: Severe Weather, Flooding Canal failure, and reliability of water supply,

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: With climate change, precipitation events are expected to be more intense for shorter periods of time, with the canals intercepting increased run off and debris, that may lodge in the canal perimeter, inlets to flumes, or piped inlets, causing the canal to overtop, potentially causing canal failure, or failure of a hillside below the canal, interruption the PCWA water supply to PCWA and Private water treatment plants.

Project Description: This project will install automated headgates at each of the spills (controlled release points) to regulate the flows downstream of each automated headgate into the canal and releasing excess flows, up to the historical maximum(s), into the spill channel, measuring each of these flows for record keeping and planning.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: PCWA Capital Improvement

Responsible Agency/ Department/Partners: PCWA Technical Services

Cost Estimate: \$ 2,000,000

Benefits (Losses Avoided): During large precipitation events, only the amount of water needed to meet demands is allowed to remain in the canal, all other water is released in a controlled manner, reducing the potential for damage to the canal and the spill way. Further, the automated headgates adjust to changing conditions in real time.

Adding the automated headgates to the SCADA systems also allows for remote control and monitoring of the canal system, allowing the operators to narrow areas that may need to have operator intervention to restore flows in the canal, or narrow where there may be an issue with the canal.

Potential Funding: HGMP grant funding, State grant funding, PCWA CIP budget

Timeline: Unknown, Concept stage of planning.

Project Priority (H, M, L): Medium

Action 16. Pumps at Halsey Forebay

Hazards Addressed: Drought, Severe Weather, Water supply reliability.

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: In the event of the Bear River Canal is out of service, or water is unavailable to the PCWA Upper Bowman Canal to provide water to the Bowman Canal, hence the PCWA Bowman and Christian Valley water treatment plants, storage in PG&E Halsey Forebay may be available as an alternate water supply.

Project Description: This project will install permanent pumping facilities, either electric, diesel powered, or both, at PG&E Halsey Forebay, connecting to existing piping under Christian Valley Road, to supply water to the Bowman Canal for use at the PCWA Bowman and Christian Valley WTP's.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: PCWA Capital Improvement

Responsible Agency/ Department/Partners: PCWA Technical Services, PG&E

Cost Estimate: \$500,000

Benefits (Losses Avoided): Additional/supplemental water supply to the PCWA Bowman and Christian Valley water treatment plants.

Potential Funding: HGMP grant funding, State grant funding, PCWA CIP budget

Timeline: Unknown, concept.

Project Priority (H, M, L): M

Action 17. Backup Electrical Generation at American River and Ophir Road Pump Stations

Hazards Addressed: Drought, Severe Weather, Water supply reliability, power interruptions.

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Since 2018, PG&E and other California power suppliers have used Public Power Safety Shutoffs (PSPS) to reduce the potential of wildfires that may occur due to high winds and dry weather that may damage power lines. These PSPS event generally occur during the same time period when PG&E performs maintenance activities on their hydroelectric canal system, Reducing the primary water supply for PCWA by 90%.

During these PG&E maintenance activities, PCWA utilizes a backup water supply from the American River, a PSPS event during this time effectively eliminates the entire PCWA water supply, hence treated water to over 200,000 persons and businesses.

To deliver water to the PCWA treatment plants, water must first be pumped from the American River into a tunnel under the City of Auburn, then pumped from the tunnel to an adjacent canal, or pumped again directly to at PCWA treatment plant.

Project Description: This project will install sufficient diesel-powered electrical generation, providing and un-interrupted water supply from the American River during PSPS or other electrical interruptions that occur during the same time as a reduction in water supply.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: PCWA Capital Improvement

Responsible Agency/ Department/Partners: PCWA Technical Services, PG&E

Cost Estimate: \$8,000,000

Benefits (Losses Avoided): Uninterrupted water supply to PCWA treatment plants, hence treated water supply to over 200,000 persons and businesses

Potential Funding: HGMP grant funding, State grant funding, PCWA CIP budget

Timeline: 3 years

Project Priority (H, M, L): H

Action 18. Sierra Forest Restoration Partnerships

Hazards Addressed: Forest fire & Tree Mortality

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Wildfires are growing in frequency, size and severity. This project aims to reduce high severity wildfires and restore forest health by studying and treating forest ecosystems in the American River Watershed.

Project Description: Multiple partners have found shared interests in the American River Watershed and have sponsored, and are working the project to thin overgrowth and restore natural meadows as firebreaks. The work is creating healthy, forests resistant to wildfire. The wildfire fuels are being harvested for energy and raw material use. Scientific study is ongoing.

Other Alternatives: Single interest entities have not been able to implement viable alternatives.

Existing Planning Mechanism(s) through which Action Will Be Implemented: The Sierra French Meadows Partnership is an ongoing and collaborative partnership forwarding the goals of the Project.

Responsible Agency/ Department/Partners: PCWA, Placer County, The U.S. Forest Service, the Nature Conservancy, The Sierra Nevada Conservancy, The American River Conservancy and UC Merced SNRI.

Cost Estimate: \$5-20-Million

Benefits (Losses Avoided): Indirect costs are not calculated, but potential cost for emergency debris and sedimentation removal may exceed \$13-million. Timber, recreation loss and grazing land values are not calculated here.

Potential Funding: Grants and continued funding from the partners.

Timeline: Ongoing

Project Priority (H, M, L): H

Action 19. Colfax to Applegate Water Reliability Project

Hazards Addressed: Drought and Water Shortage and Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Climate change is projected to increase the frequency of droughts and water shortages. Wildfires are growing in frequency, size, and severity. Limited fire hydrants along the I-80 corridor create challenges to fight fires that may spark and spread into large devastating events.

Project Description: This project would construct a new water treatment plant north of the Colfax City limit and associated transmission facilities along an 8-mile stretch of the I-80 corridor. This would provide small and underfunded water providers between Colfax and Applegate with a supplemental secure source of potable water supply during dry periods. Additionally, fire hydrants would be located along the transmission pipeline as a source of water supply to aid in firefighting activities of wildfires that could spark or move to within the area.

Other Alternatives: None identified.

Existing Planning Mechanism(s) through which Action Will Be Implemented: The Placer County Water Agency is currently preparing the Colfax to Applegate Water Reliability Project to serve as a guiding document to address this hazard over a planning horizon of 30 years.

Responsible Agency/ Department/Partners: Placer County Water Agency. Possible partners/cooperators include Placer County Fire, Placer Hills FD, and Cal Fire

Cost Estimate: \$38,000,000

Benefits (Losses Avoided): Indirect costs are not calculated, but potential cost for drought and water shortage impacts and losses due to catastrophic fires to the regions would be in the tens of billions of dollars.

Potential Funding: SWRCB and DWR grants and not interest loans, FEMA grants and continued funding from the PCWA Financial Assistance Program.

Timeline: The new water treatment plant is planned for construction start in 2023 with completion in 2025. The transmission facilities associated with this project would be phased and built as funding becomes available.

Project Priority (H, M, L): H

Action 20. Emergency Evacuation / Transit Priority Lane Infrastructure – Highways 89 and 267

Hazards Addressed: Increasing emergency vehicle access and evacuation capacity on major roadways in the North Lake Tahoe region of eastern Placer County.

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Existing State Routes (SRs) 267 and 89 are the only continuous roadways that connect the Lake Tahoe region and its communities of Placer County to the Interstate 80 corridor (4-lane roadway) to the north accessed through the Town of Truckee in Nevada County. The distance on SR 89 between Tahoe City and Truckee is approximately 12 miles, and similarly, the distance on SR 267 between Kings Beach and Truckee is approximately 12 miles. Both SR 267 and SR 89 are two-lane highways with discontinuous paved shoulders. In the event of a wildfire or other emergency requiring a large-scale evacuation, the two highways could become congested and also impact emergency vehicle access.

Project Description: As part of enhancing and encouraging travel in the area using public transit, Placer County is planning to add a third travel lane to both highways for use by public transit and high occupancy vehicles only. Funding for this type of infrastructure will require several years to secure. The third lane could be used by emergency vehicles and/or evacuation purposes in the event of a large-scale emergency. This type of infrastructure should be considered the highest priority to help become fully prepared in eastern Placer County for mitigating the potential impacts of a catastrophic event requiring evacuation to help prevent casualties

Other Alternatives: None.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Placer County Resort Triangle Transportation Plan (RTTP), Sacramento Area Council of Governments (SACOG), Placer County Transportation Planning Agency (PCTPA), Tahoe Regional Planning Agency (TRPA), and Caltrans

Responsible Agency/ Department/Partners: Placer County / Department of Public Works / Caltrans

Cost Estimate: \$500M

Benefits (Losses Avoided): Improved emergency access and large-scale evacuation corridors to help prevent loss of life and limb.

Potential Funding: Placer County (Transient Occupancy Tax), Federal (FHWA, FTA and FEMA), State (Caltrans and OES)

Timeline: Planning from 2020 to 2022, Design from 2022 to 2024, Implementation from 2024 to 2030

Project Priority (H, M, L): H

Annex S Placer Hills Fire Protection District

S.1 Introduction

This Annex details the hazard mitigation planning elements specific to Placer Hills Fire Protection District (PHFPD or District), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to the PHFPD, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

S.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table S-1. Additional details on plan participation and District representatives are included in Appendix A.

Table S-1 Placer Hills FPD – Planning Team

Name	Position/Title	How Participated
Ian Gow	Fire Chief	Review and approval of information provided
Gillian Lofrano	District Manager	Provided data and information
Mark D'Ambrogi	Fire Marshal	Participated in meetings, completed required information

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the District integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the District incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table S-2.

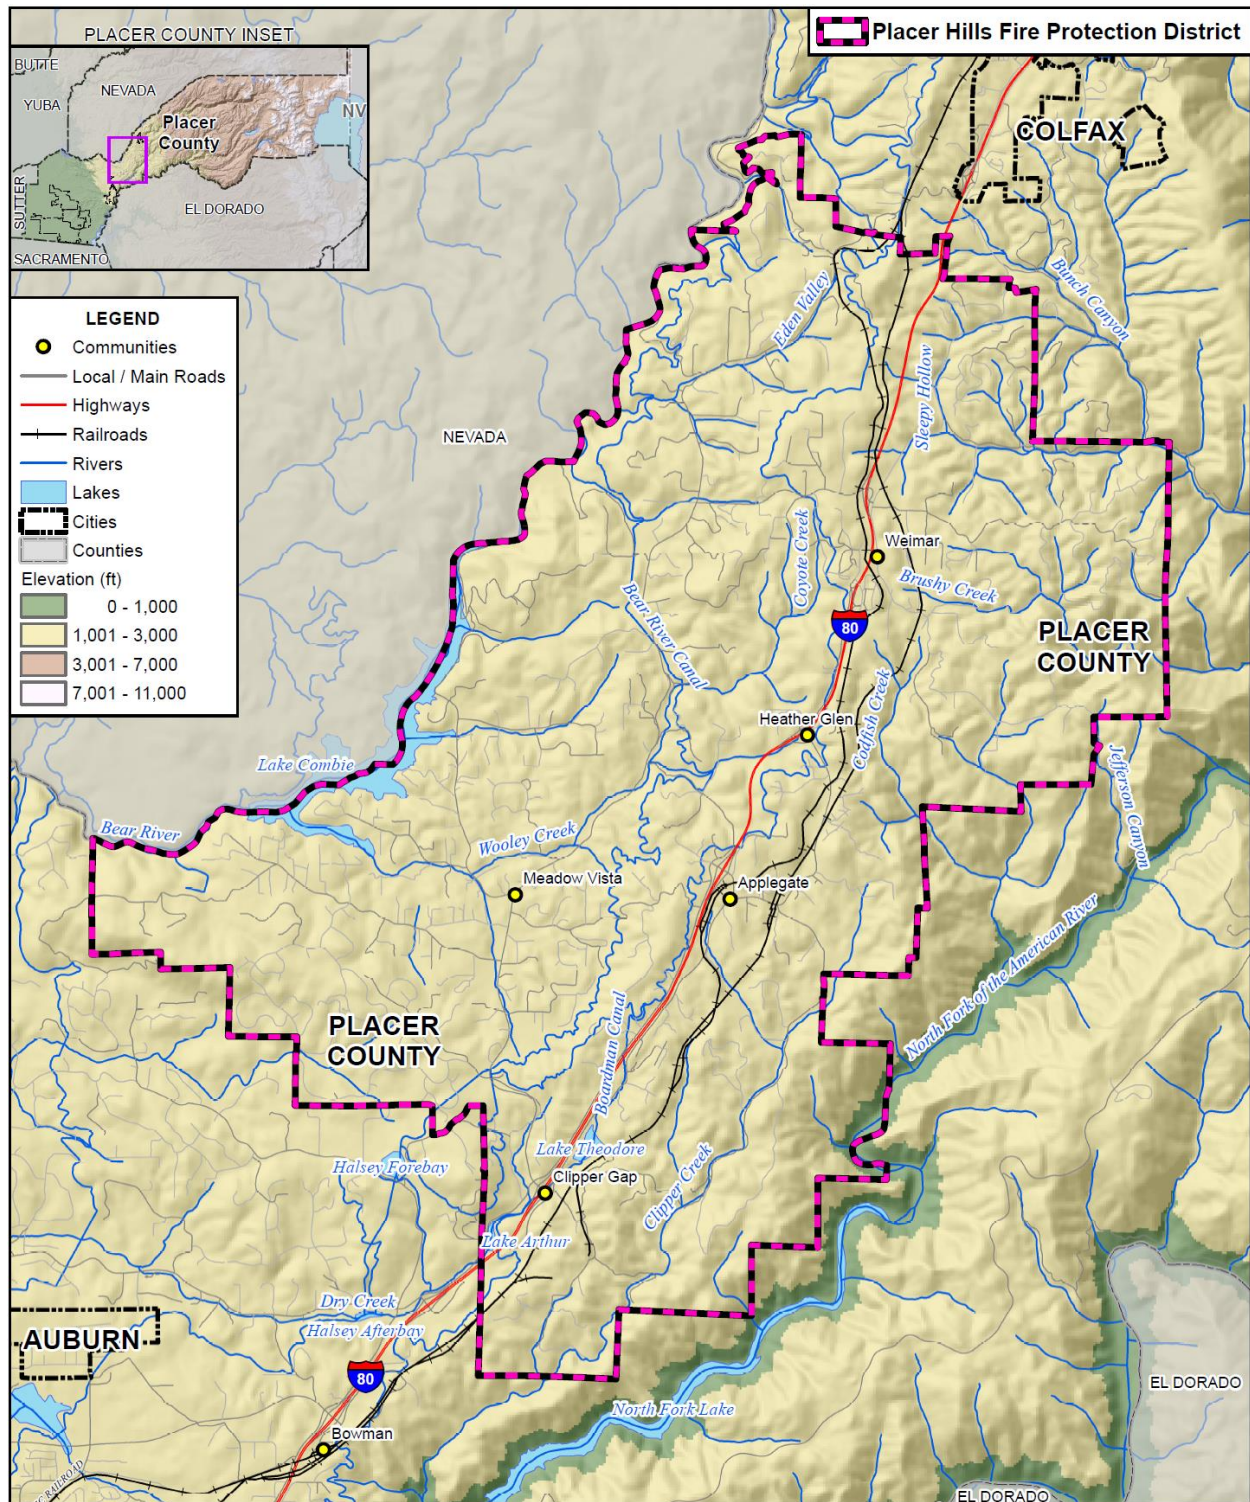

Table S-2 2016 LHMP Incorporation

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
N/A	Mitigation related planning mechanisms were completed through coordination with Placer County CDRA

S.3 District Profile

The District profile for the Placer Hills FPD is detailed in the following sections. Figure S-1 displays a map and the location of the District within Placer County.

Figure S-1 Placer Hills FPD

CONSULTING

COUNTY OF
Placer

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

S.3.1. Overview and Background

The Placer Hills Fire Protection District (Placer Hills FPD) services a 34 square mile area that houses approximately 12,500 full time residents and a day population of about 15,000 people. The District services the communities of Applegate, Clipper Gap, Eden Valley, Meadow Vista, and Weimar.

In 1949, community members of the Meadow Vista came together through the Grange to create the Meadow Vista Fire Department. In 1988, the Meadow Vista Fire Protection District, Company No. 31 and the Ponderosa Fire Brigade annexed to become the Placer Hills Fire Protection District.

Placer County established Company No. 31 in 1979 at the Weimar Institute to assist in the County contract with the California Department of Forestry. In 1980, members of the Applegate and Weimar communities came together to develop Engine Company No. 31. The community built the fire station in Applegate in 1983 and the County provided an engine and a water-tender. John Velican provided an engine for the Ponderosa Fire Brigade.

With start-up monies budgeted by the Placer County Board of Supervisors, Placer Hills Fire Protection District built a new station at Weimar Crossroads and purchased a new mini-pumper quick attack in 1990. Also in the same year, the Fire Board hired a part-time Fire Marshal to establish a fire prevention program throughout the District. The Placer County Board of Supervisors adopted Ordinance 4225-B, County Code Chapter 7.50 creating the legal authority for fire districts to collect fees in order to mitigate the impacts of new development. The Placer Hills Fire Protection District started collecting the Fire Facilities Fees in late 1990 and has been able to purchase/lease state of the art firefighting engines and equipment.

To further enhance the fire protection of this District, the Fire Board passed a Fire Suppression Benefit Assessment in 1991, which provided daytime staffing during weekdays. Placer Hills Fire Protection District started providing non-transporting Advanced Life Support Services in October 1997. In September 2001 the District staffed one engine with a crew of two, 24 hours per day and an additional engine with 2 during work hours and fire season weekends. The community approved another Benefit Assessment of \$49 in June 2004. This enabled the District to staff an engine at both the Meadow Vista and Weimar fire stations 24/7. In 2019 the community approved an additional Benefit Assessment of \$185 to continue ALS and full staffing at both stations. The Fire District runs approximately 1,800 calls every year.

S.4 Hazard Identification

Placer Hills FPD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table S-3).

Table S-3 Placer Hills FPD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Limited	Unlikely	Negligible	Low	Medium
Avalanche	Limited	Unlikely	Limited	Low	Medium
Climate Change	Limited	Likely	Critical	Medium	–
Dam Failure	Limited	Occasional	Negligible	Low	Medium
Drought & Water Shortage	Extensive	Likely	Critical	High	High
Earthquake	Limited	Unlikely	Negligible	Low	Low
Floods: 1%/0.2% annual chance	Limited	Likely	Limited	Medium	Medium
Floods: Localized Stormwater	Extensive	Likely	Critical	Medium	Medium
Landslides, Mudslides, and Debris Flows	Limited	Unlikely	Critical	Low	Medium
Levee Failure	Limited	Unlikely	Negligible	Low	Medium
Pandemic	Significant	Unlikely	Critical	Low	Medium
Seiche	Limited	Unlikely	Negligible	Low	Medium
Severe Weather: Extreme Heat	Extensive	Likely	Critical	Medium	High
Severe Weather: Freeze and Snow	Limited	Unlikely	Limited	Medium	Medium
Severe Weather: Heavy Rains and Storms	Limited	Likely	Negligible	Low	Medium
Severe Weather: High Winds and Tornadoes	Limited	Unlikely	Limited	Low	Low
Tree Mortality	Limited	Likely	Limited	Medium	High
Wildfire	Extensive	Highly Likely	Catastrophic	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

S.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District’s hazards and assess the District’s vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

S.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section S.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table S-3) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

S.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District’s total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the Placer Hills FPD’s assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table S-4 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. Placer Hills FPD’s physical assets, valued at over \$12 million, consist of the buildings and infrastructure to support the District’s operations.

Table S-4 Placer Hills FPD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
Station 84	Essential	\$5,000,000	Wildfire
Station 85	Essential	\$2,000,000	Wildfire
Station 86	Essential	\$4,000,000	Wildfire
District Administrative Offices	Essential	\$1,000,000	Wildfire
Total		\$12,000,000	

Source: Placer Hills FPD

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. Placer Hills FPD provides services to a number of resident types of which include: retired individuals, a majority of the population, senior and elderly persons, working families that commute to school and work, second family homes used periodically throughout the year, and recreational enthusiasts utilizing natural resources in the area.

It is important to note that there are several elderly, disabled, and low income people in the Placer Hills area. In the case of a wildfire evacuation, these people may not have transportation. Likewise, in the event of a power outage during the winter months, these special populations may not be able to get to a shelter for warmth.

Natural Resources

Placer Hills FPD has a variety of natural resources of value to the District. These natural resources parallels that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Historic and Cultural Resources

Placer Hills FPD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallels that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan. The District is in the planning stages of replacing the current Station 84, anticipating new construction in the next 4-5 years.

Development since 2016

Population growth since 2016 within District boundaries are covered in Section 4.3.1 of the Base Plan and in the individual annexes of the incorporated communities falling within the service area of the District.

No District facilities have been constructed since 2016. In 2019 the District purchased a commercial two story building for use as Administrative Offices, Board Meeting Room, and training classroom. Prior to that Administrative Offices were located within Station 84. This facility, like all District facilities, are located within a High Fire Severity Zone. No expansion of service areas is planned.

The Placer Hills Fire Protection District has a cooperative agreement with the Newcastle Fire Protection District for Administrative and Operation services. Of which include: Fire Chief, District Manager, Fire Marshal services, Battalion Chief response, and cross staffing of engine company personnel. Discussions are in process to evaluate the feasibility of consolidation between the two districts.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. The District is in the planning stages of creating an outdoor training facility for all risk hazard training. There are no plans for expansion of the District's service area. More general information on growth and development in Placer County as a whole can be found in "Growth and Development Trends" in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

S.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table S-3 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Climate Change

Likelihood of Future Occurrence—Likely

Vulnerability—Medium

Hazard Profile and Problem Description

Climate change adaptation is a key priority of the State of California. The 2018 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state’s infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Location and Extent

Climate change is a global phenomenon. It is expected to affect the whole of the District, Placer County, and State of California. There is no scale to measure the extent of climate change. Climate change exacerbates other hazards, such as drought, extreme heat, flooding, wildfire, and others. The speed of onset of climate change is very slow. The duration of climate change is not yet known, but is feared to be tens to hundreds of years.

Past Occurrences

Climate change has never been directly linked to any declared disasters. While the District noted that climate change is of concern, no specific impacts of climate change could be recalled. The District and HMPC members did, however, note that in Placer County, the strength of storms does seem to be increasing and the temperatures seem to be getting hotter. Hotter temperatures, combined with recent drought conditions, exacerbates the potential for damaging wildfires.

Vulnerability to and Impacts from Climate Change

The California Adaptation Planning Guide (APG) prepared by California OES and CNRA was developed to provide guidance and support for local governments and regional collaboratives to address the unavoidable consequences of climate change. California's APG: Understanding Regional Characteristics has divided California into 11 different regions based on political boundaries, projected climate impacts, existing environmental setting, socioeconomic factors and regional designations. Placer County falls within the North Sierra Region characterized as a sparsely settled mountainous region where the region's economy is primarily tourism-based. The region is rich in natural resources, biodiversity, and is the source for the majority of water used by the state. This information can be used to guide climate adaptation planning in the District and Placer County Planning Area.

The California APG: Understanding Regional Characteristics identified the following impacts specific to the North Sierra region in which the Placer County Planning Area is part of:

- Temperature increases
- Decreased precipitation
- Reduced snowpack
- Reduced tourism
- Ecosystem change
- Sensitive species stress
- Increased wildfire

Assets at Risk

The District noted that its facilities will most likely not be at risk from climate change.

Drought & Water Shortage

Likelihood of Future Occurrence—Likely

Vulnerability—High

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area's usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table S-5.

Table S-5 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water

supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

Impacts that may affect the District due to drought are the increased risks of wildfire due to reduced fuel moistures and reduction of water sources for firefighting activities.

Assets at Risk

All District assets (from Table S-4) are at risk from this hazard.

Flood: 1%/0.2% Annual Chance

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

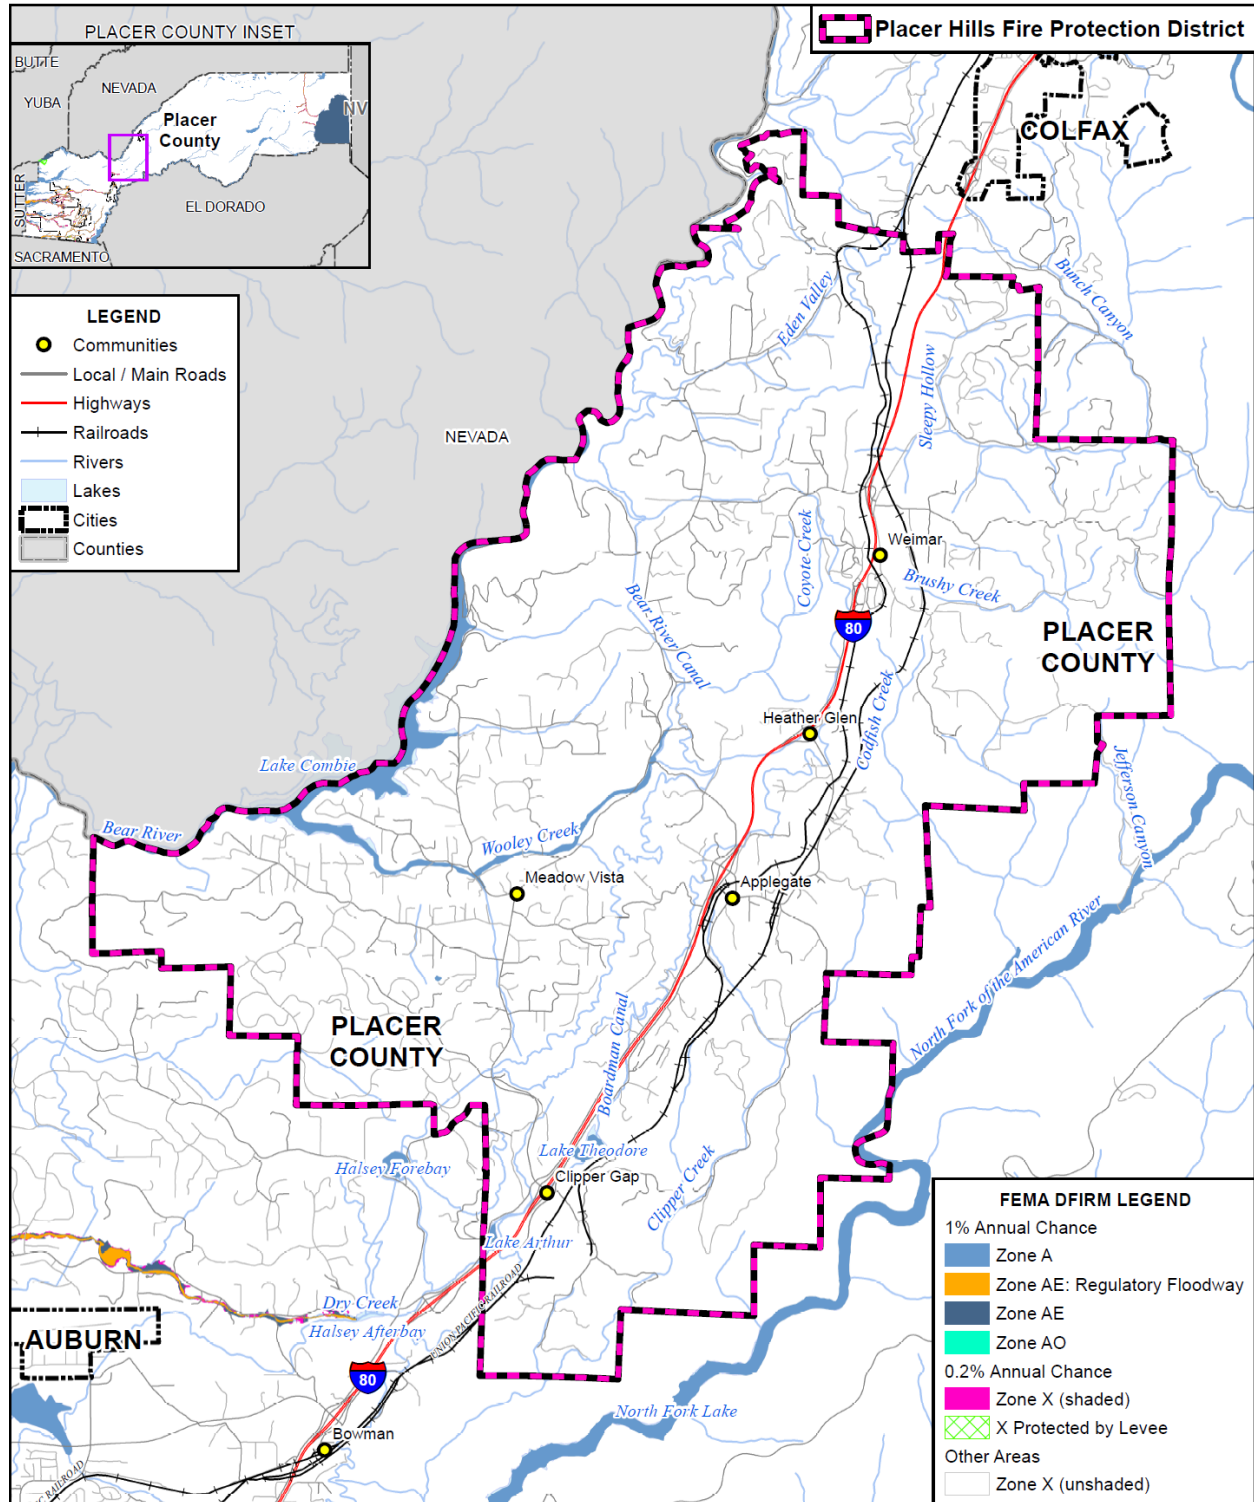

This hazard analyzes the FEMA DFIRM 1% and 0.2% annual chance floods. These tend to be the larger floods that can occur in the County or in the District, and have caused damages in the past. Flooding is a significant problem in Placer County and the District. Historically, the District has been at risk to flooding primarily during the winter and spring months when river systems in the County swell with heavy rainfall and snowmelt runoff. Normally, storm floodwaters are kept within defined limits by a variety of storm drainage and flood control measures. Occasionally, extended heavy rains result in floodwaters that exceed normal high-water boundaries and cause damage.

As previously described in Section 4.3.12 of the Base Plan, the Placer County Planning Area and the Placer Hills FPD have been subject to historical flooding.

Location and Extent

The Placer Hills FPD has areas located in the 1% annual chance floodplain. This is seen in Figure S-2.

Figure S-2 Placer Hills FPD – FEMA DFIRM Flood Zones

Data Source: FEMA DFIRM 11/2/2018, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Table S-6 details the DFIRM mapped flood zones within the 1% annual chance flood zone as well as other flood zones located within the District.

Table S-6 Placer Hills FPD– DFIRM Flood Hazard Zones

Flood Zone	Description	Flood Zone Present in the District
A	Areas subject to inundation by the 1% annual-chance flood event generally determined using approximate methodologies. Because detailed hydraulic analyses have not been performed, no Base Flood Elevations (BFEs) or flood depths are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	Y
AE	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	N
AE – Regulatory Floodway	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply. Different from AE in that it adds the water course and adjacent lands that must be reserved in order to discharge the base flood without increasing the water surface elevation by more than one foot.	N
AH	An area inundated by 1% annual chance flooding (usually an area of ponding), for which BFEs have been determined; flood depths range from 1 to 3 feet	N
AO	Areas subject to inundation by 100-year shallow flooding (usually sheet flow on sloping terrain) where average depths are between one and three feet	N
Shaded X	500-year flood the areas between the limits of the 1% annual chance flood and the 0.2-percent-annual-chance (or 500-year) flood	N
X Protected by Levee	An area determined to be outside the 500-year flood and protected by levee from 100-year flood	N
X	Areas outside of known floodplains.	Y

Source: FEMA

Additionally, flood extents can generally be measured in volume, velocity, and depths of flooding. Expected flood depths in the District vary, depending on the nature and extent of a flood event; specific depths are unknown. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Flooding in the District tends to have a shorter speed of onset, due to the amount of water that flows through the District.

Past Occurrences

A list of state and federal disaster declarations for Placer County from flooding is shown on Table S-7. These events also likely affected the District to some degree.

Table S-7 Placer County – State and Federal Disaster Declarations from Flood 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Flood (including heavy rains and storms)	16	1950, 1955, 1958 (twice), 1962, 1963, 1969, 1973, 1980, 1983, 1986, 1995 (twice), 1997, 2008, 2017	13	1955, 1958, 1962, 1964, 1969, 1983, 1986, 1995 (twice), 1997, 2006 (twice), 2017

Source: Cal OES, FEMA

Vulnerability to and Impacts from Flood

Floods have been a part of the District’s historical past and will continue to be so in the future. During winter months, long periods of precipitation and the timing of that precipitation are critical in determining the threat of flood, and these characteristics further dictate the potential for widespread structural and property damages. Predominantly, the effects of flooding are generally confined to areas near the waterways of the County. As waterways grow in size from local drainages, so grows the threat of flood and dimensions of the threat. This threatens structures in the floodplain. Structures can also be damaged from trees falling as a result of water-saturated soils. Electrical power outages happen, and the interruption of power causes major problems. Loss of power is usually a precursor to closure of governmental offices and community businesses. Roads can be damaged and closed, causing safety and evacuation issues. People may be swept away in floodwaters, causing injuries or deaths.

Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits. Direct impacts, such as drowning, can be limited with adequate warning and public education about what to do during floods. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, loss of environmental resources, and economic impacts.

Assets at Risk

No District assets (from Table S-4) are at risk from this hazard.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Flooding occurs in areas other than the FEMA mapped 1% and 0.2% annual chance floodplains. Flooding may be from drainages not studied by FEMA, lack of or inadequate drainage infrastructure, or inadequate maintenance. Localized, stormwater flooding occurs throughout the County during the rainy season from November through April. Prolonged heavy rainfall contributes to a large volume of runoff resulting in high peak flows of moderate duration.

Location and Extent

The Placer Hills FPD is subject to localized flooding throughout the District. Flood extents are usually measured in areas affected, velocity of flooding, and depths of flooding. Expected flood depths in the District vary by location. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Localized flooding in the District tends to have a shorter speed of onset, especially when antecedent rainfall has soaked the ground and reduced its capacity to absorb additional moisture.

The District tracks localized flooding areas. localized flood areas identified by the Placer Hills FPD are summarized in Table S-8.

Table S-8 Placer Hills FPD – List of Localized Flooding Problem Areas

Area Name	Flooding	Pavement Deterioration	Washout	High Water	Landslide/ Mudslide	Debris	Downed Trees
Placer Hills Rd at Crother Rd	X			X		X	
Placer Hills Rd along Woolley Creek	X			X		X	
Applegate Rd at railroad undercrossing	X			X			
Boole Rd at Hilltop Rd	X			X		X	
Combie Rd at lower parts	X			X			
Canyon Way at Live Oak	X			X		X	
Placer Hills Rd between Crother Rd and West Weimar Cross Rd					X		X

Source: Placer Hills FPD

Past Occurrences

There have been no federal or state disaster declarations in the County due to localized flooding. The District noted the following past occurrences of localized flooding:

Minor flooding occurs during heavy and prolonged periods of rain throughout the District. Such occurrences cause delays and or re-routing to emergency calls for service. Most all occurrences are confined to county roadways. Locations of the minor flooding that occurs is as follows:

Minor rock debris slides occur during heavy and prolonged periods of rain throughout the District. Such occurrences cause delays and or re-routing to emergency calls for service. Most all occurrences are confined to county roadways which are located along all portions of Placer Hills Rd and portions of Canyon Way.

Vulnerability to and Impacts from Localized Flooding

Historically, much of the growth in the District and County has occurred adjacent to streams, resulting in significant damages to property, and losses from disruption of community activities when the streams overflow. Additional development in the watersheds of these streams affects both the frequency and duration of damaging floods through an increase in stormwater runoff.

Primary concerns associated with stormwater flooding include life safety issues, and impacts to property and to infrastructure that provides a means of ingress and egress throughout the community. Ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Objects can also be buried or destroyed through sediment deposition. Floodwaters can break utility lines and interrupt services. Standing water can cause damage to crops, roads, and foundations. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

The District's concerns with localized flooding include increased response times to emergencies and the ability of citizen evacuation in flooded areas.

Assets at Risk

No District assets (from Table S-4) are at risk from this hazard.

Severe Weather: Extreme Heat

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to FEMA, extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. Heat kills by taxing the human body beyond its abilities. In extreme heat and high humidity, evaporation is slowed, and the body must work extra hard to maintain a normal temperature.” Most heat disorders occur because the victim has been overexposed to heat or has over-exercised for his or her age and physical condition. Older adults, young children, and those who are sick or overweight are more likely to succumb to extreme heat.

In addition to the risks faced by citizens of the District, there are risk to the built environment from extreme heat. While extreme heat on its own does not usually affect structure, extreme heat during times of drought

can cause wildfire risk to heighten. Extreme heat and high winds can cause power outages and PSPS events, causing issues to buildings in the District.

Extreme Heat and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on these types of power outages can be found in Section 4.3.2 of the Base Plan.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, including periods of high winds, high temperatures, and low humidity, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Location and Extent

Heat is a regional phenomenon and affects the whole of the District. Heat emergencies are often slower to develop, taking several days of continuous, oppressive heat before a significant or quantifiable impact is seen. Heat waves do not strike victims immediately, but rather their cumulative effects slowly affect vulnerable populations and communities. Heat waves do not generally cause damage or elicit the immediate response of floods, fires, earthquakes, or other more "typical" disaster scenarios.

The NWS has in place a system to initiate alert procedures (advisories or warnings) when extreme heat is expected to have a significant impact on public safety. The expected severity of the heat determines whether advisories or warnings are issued. The NWS HeatRisk forecast provides a quick view of heat risk potential over the upcoming seven days. The heat risk is portrayed in a numeric (0-4) and color (green/yellow/orange/red/magenta) scale which is similar in approach to the Air Quality Index (AQI) or the UV Index. This can be seen in Section 4.3.2 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for heat. The District Planning Team noted that since extreme heat is a regional phenomenon, events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.2.

The District has experienced increased wildfire danger during times of extreme heat and increased medical responses due to heat related illness.

During times of PSPS the District has been affected with loss of power that impacts communications such as internet and phone. Station 84, Station 86, and the Administrative Offices have back-up generators to continue continuity of services.

Vulnerability to and Impacts from Extreme Heat

The District experiences temperatures in excess of 100°F during the summer and fall months. The temperature moves to 105-110°F in rather extreme situations. During these times, drought conditions may worsen. Also, power outages and PSPS events may occur during these times as well, especially when combined with the potential for severe wind events. Health impacts, including loss of life, are often the primary concern with this hazard, though economic impacts are also an issue.

Days of extreme heat have been known to result in medical emergencies, and unpredictable human behavior. Periods of extended heat and dryness (droughts) can have major economic, agricultural, and water resources impacts. Extreme heat can also dry out vegetations, making it more vulnerable to wildfire ignitions and spread.

Extreme heat is a concern to the District. During extreme hot weather, the risk of wildfire increases. This can be further exacerbated during periods of drought. Also vulnerable to the effects of extreme hot weather is the elderly population located within District boundaries. The District contains a significant elderly population, with some residing in homes that have not been sufficiently updated to protect against extreme temperatures. The effects of extreme heat to the District include increased wildfire danger and potential heat related issues to personnel engaging in emergency response.

Assets at Risk

No District assets (from Table S-4) are at risk from this hazard.

Severe Weather: Freeze and Snow

Likelihood of Future Occurrence—Unlikely

Vulnerability—Medium

Hazard Profile and Problem Description

According to the NWS and the WRCC, winter snowstorms can include heavy snow, ice, and blizzard conditions. Heavy snow can immobilize a region, stranding commuters, stopping the flow of supplies, and

disrupting emergency and medical services. Accumulations of snow can collapse roofs and knock down trees and power lines. In rural areas, homes and farms may be isolated for days, and unprotected livestock may be lost. The cost of snow removal, damage repair, and business losses can have a tremendous impact on cities and towns.

Heavy accumulations of ice can bring down trees, electrical wires, telephone poles and lines, and communication towers. Communications and power can be disrupted for days until the damage can be repaired. Power outages can have a significant impact on communities, especially critical facilities such as public utilities. Even small accumulations of ice may cause extreme hazards to motorists and pedestrians.

Some winter storms are accompanied by strong winds, creating blizzard conditions with blinding wind-driven snow, severe drifting, and dangerous wind chills. Strong winds accompanying these intense storms and cold fronts can knock down trees, utility poles, and power lines. Blowing snow can reduce visibility to only a few feet in areas where there are no trees or buildings. Serious vehicle accidents with injuries and deaths can result. Freezing temperatures can cause significant damage to the agricultural industry.

Location and Extent

Freeze and snow are regional issues, meaning the entire District is at risk to cold weather and freeze events. While there is no scale (i.e. Richter, Enhanced Fujita) to measure the effects of freeze, the WRCC reports that in a typical year, minimum temperatures fall below 32°F on 22.6 days with 0 days falling below 0°F in western Placer County. Snowfall is measured in depths, and the WRCC reports that average snowfall on the western side of the County is 1.4 inches. Freeze and snow have a slow onset and can generally be predicted in advance for the County. Freeze events can last for hours (in a cold overnight), or for days to weeks at a time. Snow event can last for hours or days, but is more unlikely in the western portion of the County. When it does snow, the snow often melts relatively quickly.

Past Occurrences

There has been no federal and one state disaster declarations in the County for freeze and snow, as shown on Table S-9.

Table S-9 Placer County – State and Federal Disaster Declarations from Freeze and Snow 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Freeze	1	1972	0	–

Source: Cal OES, FEMA

The District noted that cold and freeze is a regional phenomenon; events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.3.

The most eastern portion of the District that include the communities of Applegate, Weimar, and unincorporated Colfax experience snow and freezing. Typically this occurs 4-8 times a year requiring fire apparatus to utilize chains on response vehicles to navigate these conditions. This will usually result in

extended response times. An increase for calls of service due to broken water pipes does occur during these events.

Vulnerability to and Impacts from Severe Weather: Freeze and Snow

The District experiences temperatures below 32 degrees during the winter months. Freeze can cause injury or loss of life to residents of the District. While it is rare for buildings to be affected directly by freeze, damages to pipes that feed buildings can be damaged during periods of extreme cold. Freeze and snow can occasionally be accompanied by high winds, which can cause downed trees and power lines, power outages, accidents, and road closures. Transportation networks, communications, and utilities infrastructure are the most vulnerable physical assets to impacts of severe winter weather in the County.

Freeze and snow are a concern to the District. During periods of freeze and snow, pipes in both residential and commercial buildings freeze and crack, and transit becomes difficult with many roads in the area freezing over. The impact to the area road system is not just a concern to residents, but also to the emergency service crews who can become immobilized during emergency situations. Even the small snow events that occur half a dozen times every year in the Weimar area create significant traffic issues for cars and school buses. According to the Placer Hills FPD planning team, winter storms resulting in up to three feet of snow occurred in 1990 causing moderate property damage, and closing businesses, schools, and roads creating significant impacts to the area. During extreme winter events, response times to emergencies may be extended. Also vulnerable to the effects of freeze and snow is the elderly population located within District boundaries. The District contains a significant elderly population, with some residing in homes that have not been sufficiently updated to protect against extreme temperatures.

Impacts to the District include extended response times, increase in freeze related incidents of broken water pipes, increase in vehicle accidents, and medical emergencies related to freezing conditions.

Assets at Risk

No District assets (from Table S-4) are at risk from this hazard.

Tree Mortality

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, and contribute to future fuel loads in forests surrounding communities. During extended drought, tree mortality is driven by a build-up in endemic bark beetle populations and exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events.

Location and Extent

Onset of tree mortality events can be relatively fast; however conditions – such as high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas, and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 - 40 dead trees per acre
- Orange depicting 5 -15 dead trees per acre
- Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the middle and eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A number of Placer County areas were designated during this event and the majority of Placer County watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality, along with numerous Tier 1 High hazard “hot spots”.”. A map of these areas was shown in in Section 4.3.18 of the Base Plan.

There have been several locations where tree mortality has been present in the District. Most areas have been relatively small in scale limited to 5-10 dead trees per acre on private properties. These areas have been mitigated by property owner actions to eliminate the dead trees.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015.

Past tree mortality in the District has been very limited, 1-2 trees on any given private parcel. Majority of tree mortality has occurred at higher elevations including the North Fork Shaded Fuel Break contingent to District boundary. This project is a Cal Fire project and tree mortality is addressed through the implementation.

Vulnerability to and Impacts from Tree Mortality

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose

on trees (i.e. Soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead trees within the wildland urban intermix or wildland urban interface or urban areas therefore pose a greater risk to due to their proximity to residents, businesses, and road, power, and communication infrastructure.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure.

The primary concerns the District has concerning tree mortality is the increased dead fuel loading for wildfire and falling dead trees into structures causing damage and or injury.

Assets at Risk

No District assets (from Table S-4) are at risk from this hazard.

Wildfire

Likelihood of Future Occurrence–Highly Likely
Vulnerability–High

Hazard Profile and Problem Description

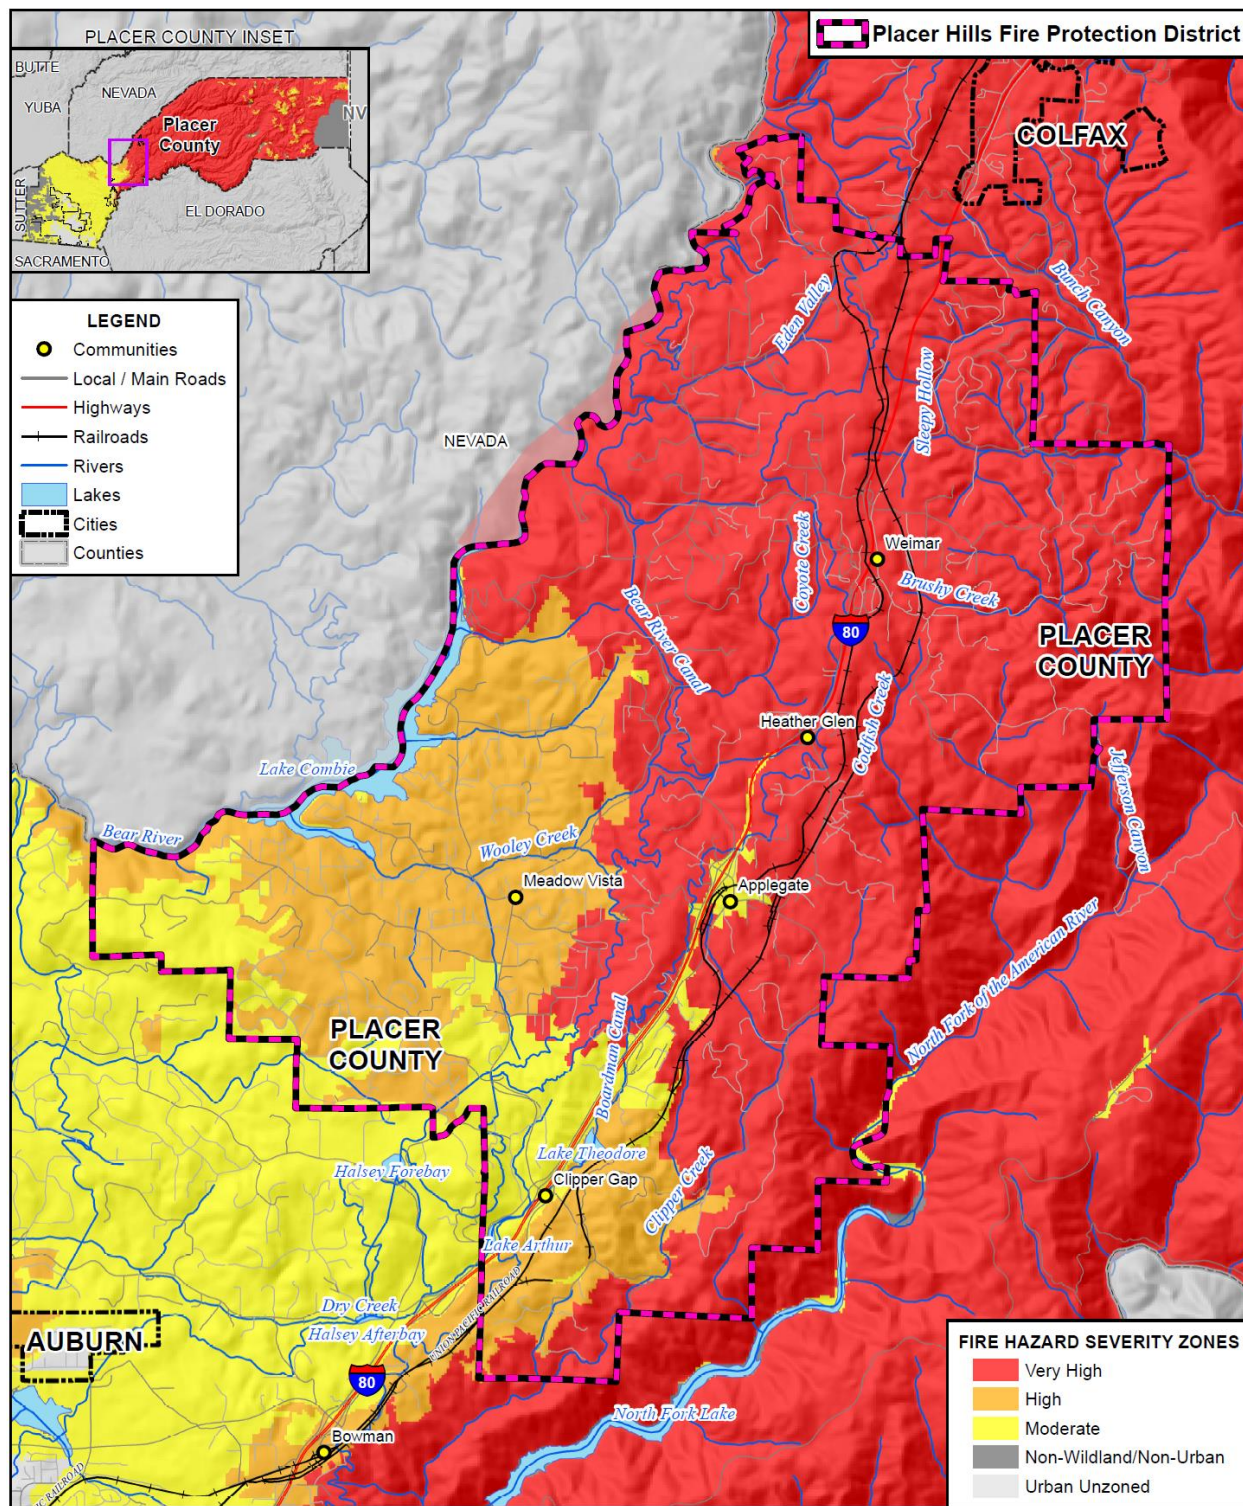

Wildland fire and the risk of a conflagration is an ongoing concern for the Placer Hills FPD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the Placer Hills FPD were created. Figure S-3 shows the CAL FIRE FHSZ in the District. As shown on the maps, fire hazard severity zones within the District range from Moderate to Very High.

The entire Placer Hills Fire District is within State Responsibility Area (SRA). Cal Fire is the primary agency for wildfire with assistance from the Placer Hills Fire District. Wildfire activity is captured and recorded by Cal Fire for the LHMP.

Figure S-3 Placer Hills FPD – Fire Hazard Severity Zones

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table S-10.

Table S-10 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

The Placer Hills Fire District responds to structure fires. There have been no significant sole structure fires within the District in the last 5 years.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat

of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

Since all of the District is within a Fire Hazard Severity Zone as identified by Cal Fire and is a combination of Wildland Urban Intermix and Wildland Urban Interface, main concerns are for the safety of citizens and protection of structures from wildfire. Given the right conditions; weather, fuels, and topography, a wildfire can significantly impact and cause catastrophic damage to development within the District.

Assets at Risk

All District assets (from Table S-4) are at risk from this hazard.

S.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

S.6.1. Regulatory Mitigation Capabilities

Table S-11 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the Placer Hills FPD.

Table S-11 Placer Hills FPD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	N	
Capital Improvements Plan	Y	Mitigation measure to be incorporated into each specific project
Economic Development Plan	N	
Local Emergency Operations Plan	Y	Through coordination with Placer County
Continuity of Operations Plan	Y	Local District Operating Procedures, to follow Placer County Plan
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	Y	In coordination with the Placer Sierra Fire Safe Council

Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Y	Version/Year: Enforced through Placer County CDRA
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score: ??(Placer County?)
Fire department ISO rating:	Y	Rating: 3/3Y
Site plan review requirements	Y	Enforced through District Standard Conditions for Development
		Is the ordinance an effective measure for reducing hazard impacts?
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	N	(All these areas the District falls under Placer County)
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
Continued cooperative planning and building review processes to ensure all agencies apply mitigation measures and conditions for development.		

Source: Placer Hills FPD

New Development: Project Guidelines

The District has and continues to adopt Ordinances to mitigate issues related to fire and life safety. These Ordinances include adoption of the most current California Fire Code, Placer County Hazardous Vegetation Ordinance with an MOU for enforcement/abatement services, Fee schedules for plan review, approval, and inspection to ensure compliance with Ordinances.

These guidelines contain fire prevention requirements for new development. Key elements include requirements for the following:

- Addresses and Access
- Water Supply, rural and municipal
- Fire suppression systems
- Vegetation Abatement and defensible space
- Fire Alarm Systems

- Hydrants and water storage for firefighting

S.6.2. Administrative/Technical Mitigation Capabilities

The Board is comprised of 5 members and is selected by registered voters within the District. The Board serves as the governing body for the District’s residents. The Board of Directors approves District Rules and Regulations and, through the Fire Chief, ensures adherence to District policies. The Placer Hills FPD provides services through three fire stations: Meadow Vista, Applegate, and Weimar.

Placer Hills FPD’s dispatch services are provided by the Placer County Sheriff’s Office 911 center in Auburn. The 911 center uses computer aided dispatching to ensure optimal resource monitoring and management utilizing the closest resource backed up by station cover assignments in a multi-tiered alarm structure. Table S-12 identifies the personnel responsible for activities related to mitigation and loss prevention in the District.

Table S-12 Placer Hills FPD’s Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	Y	In coordination with Placer County, Yes
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	N	
Mutual aid agreements	Y	Through Western Placer County Fire Chiefs Association, closest resources response agreement
Other	Y	Placer County Code Enforcement for abatement of hazardous vegetation
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	Y	In coordination with Placer County
Floodplain Administrator	N	
Emergency Manager	Y	In coordination with Placer County
Community Planner	Y	In coordination with Placer County
Civil Engineer	Y	In coordination with Placer County
GIS Coordinator	Y	In coordination with Placer County
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	In coordination with Placer County
Hazard data and information	Y	In coordination with Placer County
Grant writing	N	
Hazus analysis	N	

Other
How can these capabilities be expanded and improved to reduce risk?
Continued cooperative planning and inspection processes to ensure all agencies apply mitigation measures and conditions to reduce risk.

Source: Placer Hills FPD

S.6.3. Fiscal Mitigation Capabilities

Table S-13 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table S-13 Placer Hills FPD’s Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	From Impact Fees and Special Assessments
Authority to levy taxes for specific purposes	Y	Voter approved only, to sustain funding for services
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	Y	Used for capital expenses
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	Not Used
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	Y	SAFER Grant for former Fire Marshal position
State funding programs	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
The District will continue to seek grant monies from all sources in order to better protect residents and structures in District territories.		

Source: Placer Hills FPD

S.6.4. Mitigation Education, Outreach, and Partnerships

Table S-14 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table S-14 Placer Hills FPD’s Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	YN	Placer Sierra Fire Safe Council, Placer County Fire Alliance. Evaluate risk and identify projects to reduce wildfire risk.
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	Updated web site, social media- Facebook, Twitter. To get safety messages out to public.
Natural disaster or safety related school programs	Y	School programs
StormReady certification	N	
Firewise Communities certification	Y	Through Placer County Fire Alliance and FIREWISE Coordinator.
Public-private partnership initiatives addressing disaster-related issues	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
Continued participation with allied agencies and organizations and collaborate with single messaging on specific issues.		

Source: Placer Hills FPD

The Placer Hills FPD has automatic aid agreements with bordering Districts and mutual aid agreements with other fire agencies throughout the area. The District relies heavily upon this aid from neighbors.

The District also works with other agencies on wildfire-related matters. Working with professional fire experts from the U.S. Forest Service and California Department of Forestry and Fire Protection helps ensure that the District’s work complements state and federal work and is up to standard for controlling wildfires.

S.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

- In 2017/18 the District received a FEMA Fire Prevention Award for a Fire Marshal position. An individual was hired for this position and when funding ended (one year funding) the individual moved on to another agency. The Fire Marshal position was retained as a part-time position as it functions to this day.
- In 2019 the District was successful in passing of Measure A. A parcel tax for all properties within the District that brings in an approximate additional 1 million dollars. This funding allows the retention of two stations staffed 24/7 with paramedic capability, an internship program that provides a third FF on each engine company, ability to reserve funds for capital improvements, and as of this date and time, all full-time positions are filled.
- The District has developed Standards for new development and implemented a fee schedule for pre-development and inspection services.
- The District has adopted the Placer County Hazardous Abatement Ordinance and has a MOU with Placer County for Code Enforcement and Abatement processes. This Ordinance is used extensively for compliance of defensible space requirements within the District.

- An Administrative building was purchased in 2020 where District Administration functions, including meeting and training rooms.
- An agreement for services was implemented between the Newcastle Fire District and Placer Hills Fire District. Placer Hills provides administrative services; Fire Chief, Fire Marshal, District Manager, Battalion Chiefs, and allows for the sharing of firefighting personnel between the two agencies to ensure maximum staffing for each work shift. Discussion of consolidating the two agencies is ongoing.

The District is involved in a variety of mitigation activities including public education, fuels management projects, and other activities to reduce fuel loads and fire risk. These mitigation activities include:

- Public Education and Fire Safety
 - ✓ A variety of public outreach activities are conducted throughout the district on an ongoing basis.
 - ✓ The District has a program where they make address signs and provide them to the public at cost.
 - ✓ The District promotes the use of the County Chipper for local residents.
- Defensible Space
 - ✓ When staffing is available for program management, the District provides defensible space inspections for area residents upon request.
 - ✓ When staffing is available for program management complaint based inspections occur for vegetation management on private properties to be in compliance with the Hazardous Vegetation Ordinance.
- New Development
 - ✓ The District has a comprehensive review, approval, and inspection process for all new development within the Districts that address fire and life safety issues in addition to the Placer County development process.

S.7 Mitigation Strategy

S.7.1. Mitigation Goals and Objectives

The Placer Hills FPD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

S.7.2. Mitigation Actions

The planning team for the Placer Hills FPD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Climate Change
- Drought & Water Shortage
- Floods: 1%/0.2% annual chance
- Floods: Localized Stormwater
- Severe Weather: Extreme Heat

- Severe Weather: Freeze and Snow
- Tree Mortality
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Address signage for residential and commercial structures.

Hazards Addressed: Multi-hazard (Climate Change, Drought & Water Shortage, Floods: 1%/0.2% annual chance, Floods: Localized Stormwater, Severe Weather: Extreme Heat, Severe Weather: Freeze and Snow, Tree Mortality, and Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Many structures throughout the fire district have either no addressing or limited addressing that is not consistent. Many structures were built at a time when there was no addressing standard in place. There is now a standard created by Placer County for consistent addressing in unincorporated areas of Placer County.

Project Description: Apply Placer County standard for addressing for all new construction throughout the fire district. Identify structures needing appropriate addressing and inform and educate property owners of a standard and consistent addressing means.

Other Alternatives: No other alternatives are identified at this time.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Addressing for new construction will be identified and implemented during the plan review and approval process as a condition to develop. Through inspection as well as emergency response to incidents where addressing is lacking, inform and educate property owners of the value of appropriate addressing.

Responsible Agency/ Department/Partners: Placer Hills Fire Protection District staff officers and engine company personnel.

Cost Estimate: No costs identified, use of district personnel to implement. Costs for address signage will be the responsibility of the property owner. Estimated at \$40-\$60 dependent upon where obtained.

Benefits (Losses Avoided): Prevent delay in emergency response to incidents. Can assist in incidents requiring evacuation and in pre-planning communities for major incidents.

Potential Funding: Possible grant funding for large scale “addressing project”. The Placer Hills Firefighter Association creates address signs for citizens as a fund raising project.

Timeline: Ongoing

Project Priority (H, M, L): High

Action 2. Defensible space inspection and implementation throughout the District.

Hazards Addressed: Wildfire, Climate Change, Drought and Water Shortage, and Extreme Heat

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Most all of the District lies within Very High or High Fire Severity Zones as identified by Cal Fire. The application of defensible space and home hardening are ways to reduce the risk of wildfire destruction. Although homeowners/business owners are aware of such risks, through an inspection process property owners can be better informed of what action they can do to reduce such risks.

Project Description: Through an inspection process, educate, inform, and make recommendation for property owners on what actions to take to reduce the risk of destruction from wildfire. Identify vegetation to remove, reduce, and maintain to achieve defensible space. Identify potential areas of home hardening to better prepare for wildfire. Conduct inspections on private properties to identify specific needs of that property to achieve defensible space.

Other Alternatives: No other alternatives are identified at this time.

Existing Planning Mechanism(s) through which Action Will Be Implemented: All new construction will be conditioned to create and maintain defensible space through the plan review and approval process as a condition to build. Through an inspection program, identify areas to conduct property inspections. The basis of the inspection program will utilize Public Resource Code (PRC), Placer County Hazardous Vegetation Ordinance, and local fire district adopted ordinance.

Responsible Agency/ Department/Partners: Placer Hills Fire Protection District designated staff will implement and manage this inspection program.

Cost Estimate: Currently the District has one part-time funded Fire Marshal position to manage this program. Additional funding will increase success in implementation. Property owners are responsible for implementing clearance requirements.

Benefits (Losses Avoided): Reduction of property loss due to wildfire may be obtained through such a program.

Potential Funding: Possible grant funding for fulltime and or additional personnel for project management and inspection. Potential of charging fee for inspection.

Timeline: Ongoing

Project Priority (H, M, L): High

Action 3. Private roadway and driveway vegetation clearances.

Hazards Addressed: Wildfire, Tree Mortality, Climate Change, Drought and Water Shortage, and Extreme Heat

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Many private roadways and driveways throughout the fire district contain dense flammable vegetation along the shoulders of the roadway/driveway as well vertical clearances. This can impede fire resource response and somewhat limit access in the event of an emergency. During wildfire conditions this can pose significant risk to responders as well as civilians.

Project Description: Through inspection, identify those areas needing fuel reduction along private roadways and driveways. Optimal clearance is 10 feet from each shoulder and 15 vertical clearance. Inform property owners of the importance and their responsibility to create and maintain these accesses for emergency response and civilian evacuation. Implement the formal process of “Notice to Abate” as needed.

Other Alternatives: No other alternatives are identified at this time.

Existing Planning Mechanism(s) through which Action Will Be Implemented: All new constructed roads and driveways will be conditioned to create and maintain clearance through the plan review and approval process as a condition to develop. Through inspection as well as emergency response to incidents, personnel will identify areas needing appropriate clearance. Once identified, a process will be initiated based on the Placer County Hazardous Vegetation Ordinance and local fire district adopted ordinance.

Responsible Agency/ Department/Partners: Placer Hills Fire Protection District staff officers and engine company personnel.

Cost Estimate: Currently the District has one part-time funded Fire Marshal position to manage this program. Additional funding will increase success in implementation. Property owners are responsible for implementing clearance requirements.

Benefits (Losses Avoided): Prevent delay in emergency response to incidents and potentially increased ability of civilian evacuation. Reduce vegetation to reduce fuel loading and the risk of wildfire.

Potential Funding: Possible grant funding for large scale roadside clearing projects for project management and fuel reduction implementation.

Timeline: Ongoing

Project Priority (H, M, L): High

Action 4. *Participate and collaborate with the Placer Sierra Fire Safe Council (PSFSC) and contribute to the Community Wildfire Protection Plan (CWPP)*

Hazards Addressed: Wildfire, Climate Change, Drought and Water Shortage, and Extreme Heat

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The Placer Hills Fire Protection District is within the boundaries of the GAAFSC. Participation from Placer Hills Fire Protection District continues strong over the years. Two (2) members of the Placer Hills Fire Protection District have been appointed to the PSFSC. The Fire Safe Council's in Placer County contribute greatly to the CWPP. This is opportunity for local fire agencies to be involved in such a process.

Project Description: Continued participation and collaboration will occur on an on-going basis. Attending monthly meetings and participate in PSFSC events by command staff member(s).

Other Alternatives: No other alternatives have been identified that includes such collaboration

Existing Planning Mechanism(s) through which Action Will Be Implemented: Identify staff personnel to attend meetings and PSFSC events.

Responsible Agency/ Department/Partners: Placer Hills Fire Protection District command staff.

Cost Estimate: No costs are associated with this action.

Benefits (Losses Avoided): Keep current on projects and public outreach campaigns. Develop a collaborative approach to the wildfire risks and reduction methods. Participate in the CWPP process.

Potential Funding: Possible grant funding through the PSFSC to assist Placer Hills Fire Protection District with fuel reduction and related projects.

Timeline: Ongoing

Project Priority (H, M, L): High

Action 5. *Heavy Rains, Localized Flooding, Flood, Freeze, and Snow Mitigation*

Hazards Addressed: Natural events that create flooding, localized flooding, freezing, and snow.

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: From time to time, the District experiences localized heavy rains that create minor flooding on streets and roads used for emergency response. In addition, freezing may occur occasionally. This natural occurrence of rain, and freeze can have an impact on response to emergencies.

Project Description: Obtain the most up-to-date information regarding adverse weather, predicted weather events, and related weather that may impact District response to emergencies.

Other Alternatives: No other alternatives are identified at this time.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Coordinate with Placer OES on specific predicted weather events. Plan response accordingly to specific event: alternate routes for flooded areas and apparatus with appropriate chains for ice. Notify Placer County Roads through Placer Dispatch for problem areas that include flooding; need for storm drain clearing, sanding of roads for ice and snow, and road closures.

Responsible Agency/ Department/Partners: Newcastle Fire Protection District staff officers and engine company personnel.

Cost Estimate: No costs identified with this operational procedure.

Benefits (Losses Avoided): Prevent delay in emergency response to incidents and safety of responding personnel.

Potential Funding: None identified for this mitigation.

Timeline: Ongoing

Project Priority (H, M, L): Medium

Annex T San Juan Water District

T.1 Introduction

This Annex details the hazard mitigation planning elements specific to the San Juan Water District (SJWD or District), a new participating jurisdiction to the 2021 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to SJWD, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

Note: SJWD participated in the original 2005 Placer County LHMP. A copy of that document could not be located by SJWD, Placer County, or Cal OES. Additionally, staff turnover in the past 16 years has reduced institutional memory of that 2005 Plan. It can be assumed that none of SJWD’s proposed mitigation actions were completed, SJWD’s mitigation priorities at that time are unknown, and that the 2005 Plan was not incorporated into any SJWD planning mechanisms. Development in the District since 2005 was described by SJWD as minimal, and a general description of more recent development in the District is included in Section T.5.2 of this Annex.

T.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table T-1. Additional details on plan participation and District representatives are included in Appendix A.

Table T-1 SJWD – Planning Team

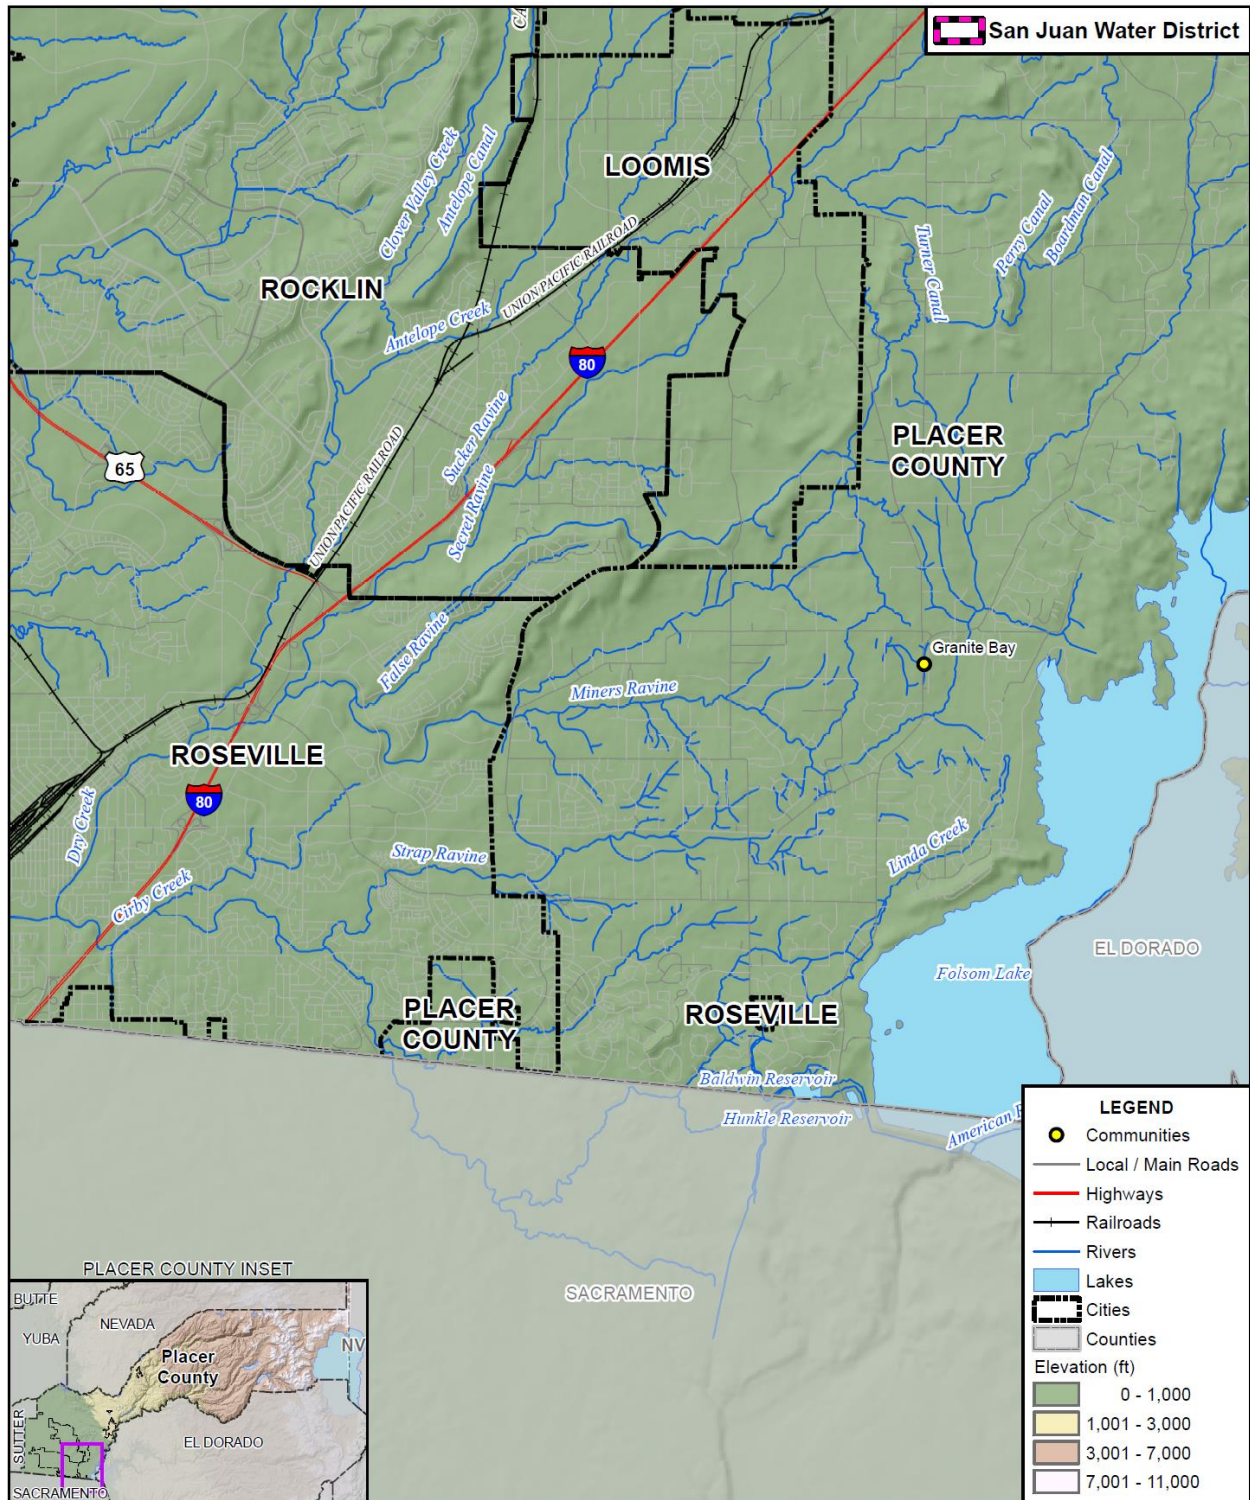

Name	Position/Title	How Participated
Scott Alcantara	Safety Regulatory Compliance Coordinator	Attended Meetings, coordinated participation, gathered information, edited and reviewed response
Tony Barela	Operations Manager	Research and review
Lisa Brown	Customer Service Manager	Research and review
Andrew Pierson	Engineering Manager	Research and review
Adam Larsen	Field Services Manager	Research and review

Name	Position/Title	How Participated
Greg Turner	Water Treatment Plant Superintendent	Research and review

T.3 District Profile

The District profile for the SJWD is detailed in the following sections. Figure T-1 displays a map and the location of the District within Placer County.

Figure T-1 SJWD

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

T.3.1. Overview and Background

San Juan Water District is a community services district established by a vote of the citizens in 1954, formed under Section 61000 et seq., Title 6, Division 3 of the California Government Code Water Code, Section 3000. We provide reliable, high-quality water service to both retail and wholesale customers in eastern Sacramento and southern Placer counties. San Juan's roots date back to the Gold Rush era with the formation in 1854 of the original entity, North Fork American River and Mining Company, later known as the North Fork Ditch Company.

SJWD provides drinking water supplies to approximately 160,000 residents in our retail and wholesale areas. The District provides treatment and delivery of more than 65,000 acre-feet of water per year through approximately 218 miles of pipeline to wholesale and retail customers. The retail division serves the northeast portion of Sacramento County, east Roseville and Granite Bay.

Wholesale customers include San Juan Water District, Citrus Heights Water District, Fair Oaks Water District, Orange Vale Water Company, a portion of the City of Folsom (north of the American River) and periodically to another 171,000 customers in Sacramento Suburban Water District.

T.4 Hazard Identification

SJWD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table T-2).

Table T-2 SJWD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Limited	Unlikely	Negligible	Low	Medium
Avalanche	Limited	Unlikely	Negligible	Low	Medium
Climate Change	Extensive	Likely	Critical	Medium	–
Dam Failure	Limited	Unlikely	Critical	High	Medium
Drought & Water Shortage	Significant	Likely	Critical	High	High
Earthquake	Significant	Occasional	Critical	High	Low
Floods: 1%/0.2% annual chance	Significant	Occasional	Limited	Medium	Medium
Floods: Localized Stormwater	Limited	Likely	Limited	Low	Medium
Landslides, Mudslides, and Debris Flows	Limited	Unlikely	Negligible	Low	Medium
Levee Failure	Limited	Unlikely	Limited	Low	Medium
Pandemic	Extensive	Likely	Critical	High	Medium
Seiche	Limited	Unlikely	Limited	Low	Medium
Severe Weather: Extreme Heat	Extensive	Likely	Limited	Medium	High
Severe Weather: Freeze and Snow	Extensive	Occasional	Limited	Medium	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Likely	Limited	Medium	Medium
Severe Weather: High Winds and Tornadoes	Extensive	Occasional	Limited	Medium	Low
Tree Mortality	Limited	Occasional	Limited	Low	High
Wildfire	Significant	Occasional	Limited	Medium	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

T.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District’s hazards and assess the District’s vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

T.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section T.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table T-2) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

T.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District’s total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the SJWD’s assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table T-3 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. SJWD’s physical assets, valued at over \$130 million, consist of the buildings and infrastructure to support the District’s operations.

Table T-3 SJWD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
Main Campus/Yard		\$10 Million	Earthquake/Flood
Water treatment plant		\$50 Million	Earthquake/Flood/Hazmat
Pumping stations		\$10 Million	Earthquake/Flood
Water distribution		\$50 Million	Earthquake/Subsidence
Water storage facilities		\$10 Million	Earthquake/Subsidence
Total		\$130 million	

Source: SJWD

Natural Resources

SJWD has a variety of natural resources of value to the District. These natural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan

Historic and Cultural Resources

SJWD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. SJWD provides drinking water supplies to approximately 160,000 residents in our retail and wholesale areas. The District provides treatment and delivery of more than 65,000 acre-feet of water per year through approximately 222 miles of pipeline to wholesale and retail customers. The retail division serves the northeast portion of Sacramento County, east Roseville and Granite Bay.

Wholesale customers include San Juan Water District, Citrus Heights Water District, Fair Oaks Water District, Orange Vale Water Company, a portion of the City of Folsom (north of the American River) and periodically to another 171,000 customers in Sacramento Suburban Water District.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

T.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table T-2 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Climate Change

Likelihood of Future Occurrence—Likely
Vulnerability—High

Hazard Profile and Problem Description

Climate change adaptation is a key priority of the State of California. The 2018 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state's infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing. The District is concerned that climate change can cause possible Harmful Algal Bloom (HAB) in its source water (Folsom Lake).

Location and Extent

Climate change is a global phenomenon. It is expected to affect the whole of the District, Placer County, and State of California. There is no scale to measure the extent of climate change. Climate change exacerbates other hazards, such as drought, extreme heat, flooding, wildfire, and others. The speed of onset of climate change is very slow. The duration of climate change is not yet known, but is feared to be tens to hundreds of years.

Past Occurrences

Climate change has never been directly linked to any declared disasters. While the District noted that climate change is of concern, no specific impacts of climate change could be recalled. The District and HMPC members did, however, note that in Placer County, the strength of storms does seem to be increasing and the temperatures seem to be getting hotter. Hotter temperatures, combined with recent drought conditions, exacerbates the potential for damaging wildfires.

Vulnerability to and Impacts from Climate Change

The California Adaptation Planning Guide (APG) prepared by California OES and CNRA was developed to provide guidance and support for local governments and regional collaboratives to address the unavoidable consequences of climate change. California's APG: Understanding Regional Characteristics has divided California into 11 different regions based on political boundaries, projected climate impacts, existing environmental setting, socioeconomic factors and regional designations. Placer County falls within the North Sierra Region characterized as a sparsely settled mountainous region where the region's economy is primarily tourism-based. The region is rich in natural resources, biodiversity, and is the source for the majority of water used by the state. This information can be used to guide climate adaptation planning in the District and Placer County Planning Area.

The California APG: Understanding Regional Characteristics identified the following impacts specific to the North Sierra region in which the Placer County Planning Area is part of:

- Temperature increases
- Decreased precipitation
- Reduced snowpack

- Reduced tourism
- Ecosystem change
- Sensitive species stress
- Increased wildfire

Assets at Risk

The District noted that its facilities will most likely not be at risk from climate change.

Dam Failure

Likelihood of Future Occurrence–Unlikely

Vulnerability–High

Hazard Profile and Problem Description

Dams are manmade structures built for a variety of uses including flood protection, power generation, agriculture, water supply, and recreation. When dams are constructed for flood protection, they are usually engineered to withstand a flood with a computed risk of occurrence. For example, a dam may be designed to contain a flood at a location on a stream that has a certain probability of occurring in any one year. If prolonged periods of rainfall and flooding occur that exceed the design requirements, that structure may be overtopped or fail. Overtopping is the primary cause of earthen dam failure in the United States.

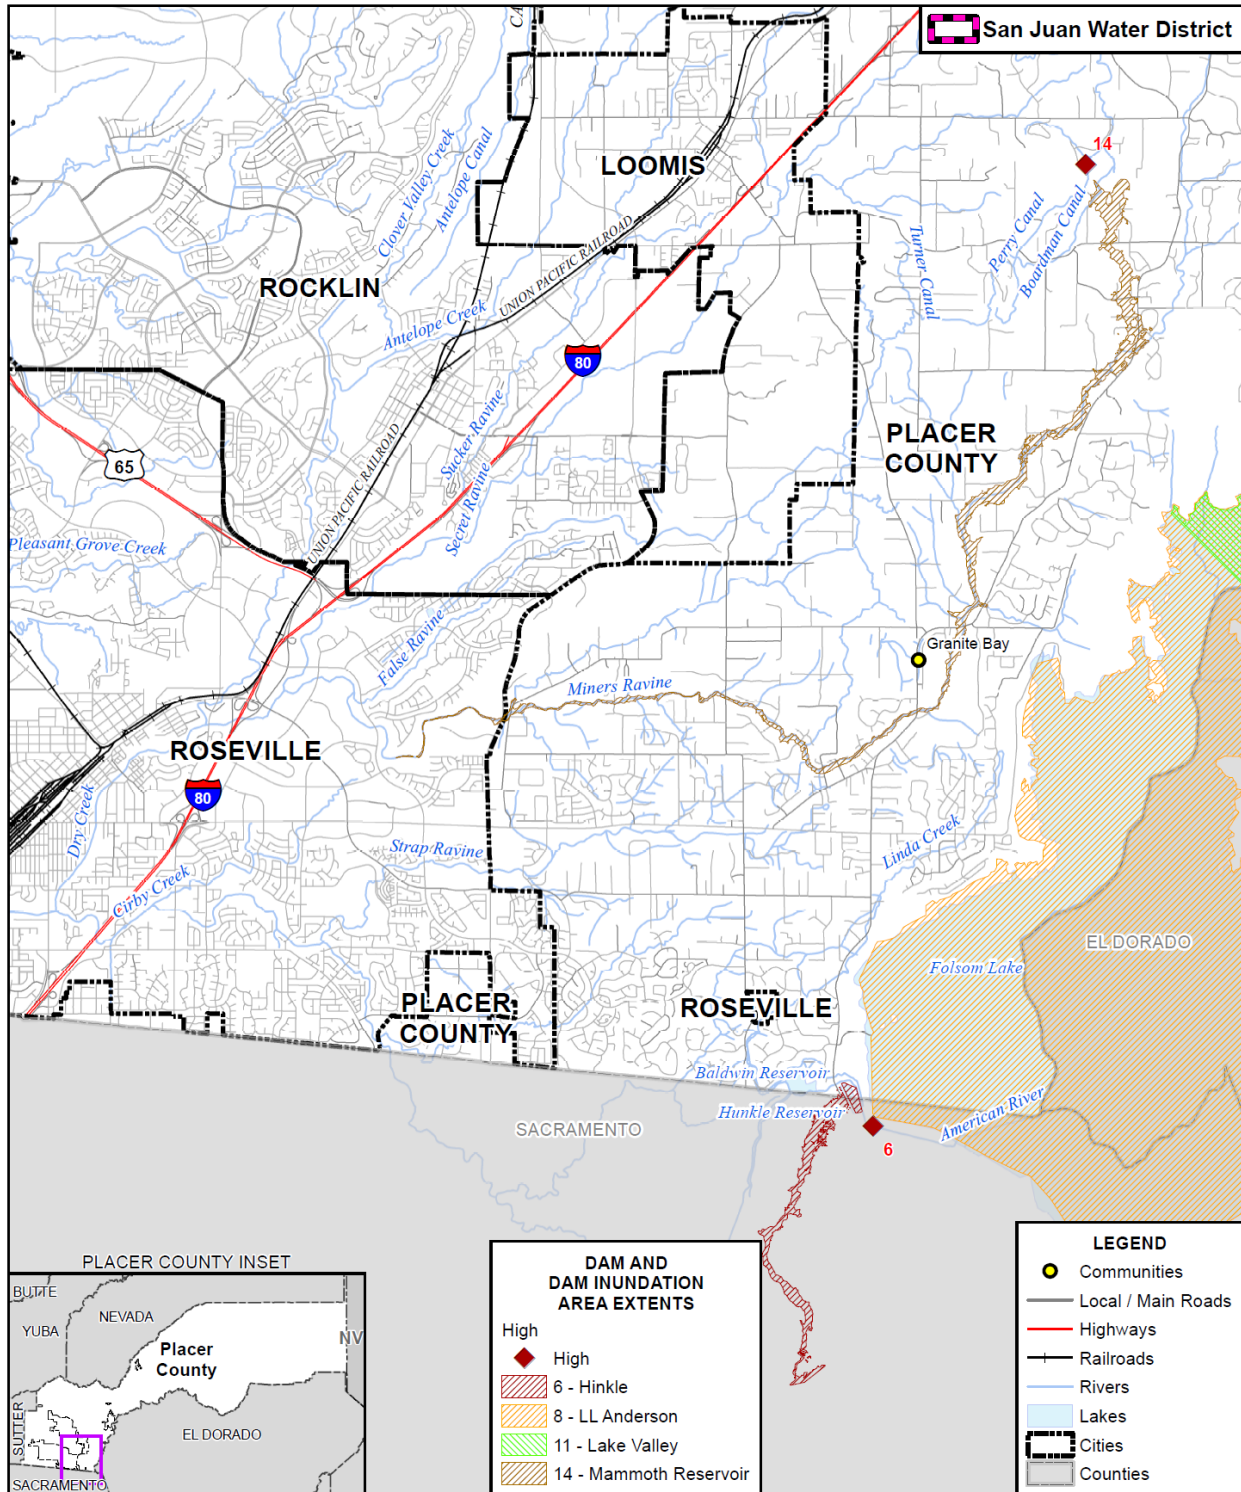

Location and Extent

Dam failure is a natural disaster from two perspectives. First, the inundation from released waters resulting from dam failure is related to naturally occurring floodwaters. Second, a total dam failure would most probably happen as a consequence of the natural disaster triggering the event, such as an earthquake. There is no scale with which to measure dam failure. However, Cal DWR Division of Safety of Dams (DOSD) assigns hazard ratings to dams within the State that provides information on the potential impact should a dam fail. The following two factors are considered when assigning hazard ratings: existing land use and land use controls (zoning) downstream of the dam. Dams are classified in four categories that identify the potential hazard to life and property: Low, Significant, High, and Extremely High. These were discussed in more detail in Section 4.3.9 of the Base Plan.

While a dam may fill slowly with runoff from winter storms, a dam break has a very quick speed of onset. The duration of dam failure is generally not long – only as long as it takes to empty the reservoir of water the dam held back. The District would be affected for as long as the flood waters from the dam failure took to drain downstream.

Dams inside the County that can affect the District can be seen on Figure T-2. No dams outside the County affect the District.

Figure T-2 SJWD – Dam Inundation Areas from Dams Inside the County

FOSTER MORRISON CONSULTING

0 1.5 3 Miles

COUNTY OF Placer

Data Source: DWR DSOD Data 2020, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Past Occurrences

There has been no federal or state disaster declarations for dam failure in the County. The District noted no other dam failure occurrences that have affected the District.

Vulnerability to and Impacts from Dam Failure

Dam failure flooding would vary by community depending on which dam fails and the nature and extent of the dam failure and associated flooding. Impacts to the District from a dam failure flood could include loss of life and injury, flooding and damage to property and structures, damage to critical facilities and infrastructure, loss of natural resources, and all other flood related impacts. Additionally, mass evacuations and associated economic losses can also be significant.

The District is concerned with flooding and disruption of utility power impacts from a dam failure event.

Assets at Risk

The District noted the following facilities at risk:

- Main campus/Yard
- Water Treatment Plant
- 4 District pumping stations

Drought & Water Shortage

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area’s usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought

- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table T-4.

Table T-4 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

San Juan Water District is fortunate to have plentiful water storage under normal circumstances. The historic drought between 2012 and 2015 resulted in minor reduction in supplies; however, the drought resulted in more significant demand reductions forced by regulatory mandates. In general, summer 2015 water use has been cut by over 30% relative to 2013 levels. Economically the drought has impacted water sales reducing revenues for the District. Prolonged drought can affect capital improvement plans and operations over time.

Assets at Risk

No District assets from Table T-3 are directly at risk from this hazard.

Earthquake

Likelihood of Future Occurrence—Occasional
Vulnerability—High

Hazard Profile and Problem Description

An earthquake is caused by a sudden slip on a fault. Stresses in the earth's outer layer push the sides of the fault together. Stress builds up, and the rocks slip suddenly, releasing energy in waves that travel through the earth's crust and cause the shaking that is felt during an earthquake. Earthquakes can cause structural damage, injury, and loss of life, as well as damage to infrastructure networks, such as water, power, gas, communication, and transportation. Earthquakes may also cause collateral emergencies including dam and levee failures, seiches, hazmat incidents, fires, avalanches, and landslides. The degree of damage depends on many interrelated factors. Among these are: the magnitude, focal depth, distance from the causative fault, source mechanism, duration of shaking, high rock accelerations, type of surface deposits or bedrock, degree of consolidation of surface deposits, presence of high groundwater, topography, and the design, type, and quality of building construction.

Location and Extent

The amount of energy released during an earthquake is usually expressed as a magnitude and is measured directly from the earthquake as recorded on seismographs. An earthquake's magnitude is expressed in whole numbers and decimals (e.g., 6.8). Seismologists have developed several magnitude scales, as discussed in Section 4.3.11 of the Base Plan. Placer County itself is traversed by a series of northwest-trending faults, called the Foothill Fault Zone, that are related to the Sierra Nevada uplift. This was the source of Oroville's 1975 earthquake (and an earlier event in the 1940s). Subsequent research of these events led to the identification and naming of the zone and questions about the siting and design of the proposed Auburn Dam. Earthquakes on nearby fault segments in the zone could be the source of ground shaking in the Placer County Planning Area.

Although portions of western and eastern Placer County are located in a seismically active region, no known faults actually go through any of the cities or towns. However, the Bear Mountain and the Melones faults are situated approximately three to four miles west and east of the City of Auburn respectively. Earthquakes on these two faults would have the greatest potential for damaging buildings in Auburn, especially the unreinforced masonry structures in the older part of the city and homes built before 1960 without adequate

anchorage of framing and foundations. Similar lower magnitude but nearby earthquakes are capable of producing comparable damages in other Placer County communities.

Another measure of earthquake severity is intensity. Intensity is an expression of the amount of shaking at any given location on the ground surface. Seismic shaking is typically the greatest cause of losses to structures during earthquakes. Seismic shaking maps for the area show Placer County and the District fall within a low to moderate shake risk.

Past Occurrences

There have been no past federal or state disaster declarations from this hazard. The District noted no past occurrences of earthquakes or that affected the District in any meaningful way.

Vulnerability to and Impacts from Earthquake

The combination of plate tectonics and associated California coastal mountain range building geology generates earthquake as a result of the periodic release of tectonic stresses. Placer County lies in the center of the North American and Pacific tectonic plate activity. There have been earthquakes as a result of this activity in the historic past, and there will continue to be earthquakes in the future of the California north coastal mountain region.

Fault ruptures itself contributes very little to damage unless the structure or system element crosses the active fault; however, liquefaction can occur further from the source of the earthquake. In general, newer construction is more earthquake resistant than older construction due to enforcement of improved building codes. Manufactured buildings can be very susceptible to damage because their foundation systems are rarely braced for earthquake motions. Locally generated earthquake motions and associated liquefaction, even from very moderate events, tend to be more damaging to smaller buildings, especially those constructed of unreinforced masonry (URM) and soft story buildings. None of these types of buildings are owned by the District.

The Uniform Building Code (UBC) identifies four seismic zones in the United States. The zones are numbered one through four, with Zone 4 representing the highest level of seismic hazard. The UBC establishes more stringent construction standards for areas within Zones 3 and 4. All of California lies within either Zone 3 or Zone 4. The SJWD is within the less hazardous Zone 3.

Impacts from earthquake in the District will vary depending on the fault that the earthquake occurs on, the depth of the earthquake strike, and the intensity of shaking. Large events could cause damages to infrastructure, critical facilities, residential and commercial properties, and possible injuries or loss of life.

Earthquake could have a significant impact on underground drinking water and the fire hydrant supply lines. Additionally, the District has some bridge crossings that supply water throughout the system. These could be disturbed by earth movement. While there is significant diversification and redundancy within the system there is the possibility of some service disruption resulting from a severe earthquake in the area.

Assets at Risk

The District noted the following facilities at risk:

- Main Water Treatment Plant
- Pumping stations
- Water Distribution system
- Water Storage facilities

Flood: 1%/0.2% Annual Chance

Likelihood of Future Occurrence—Occasional/Unlikely

Vulnerability—Medium

Hazard Profile and Problem Description

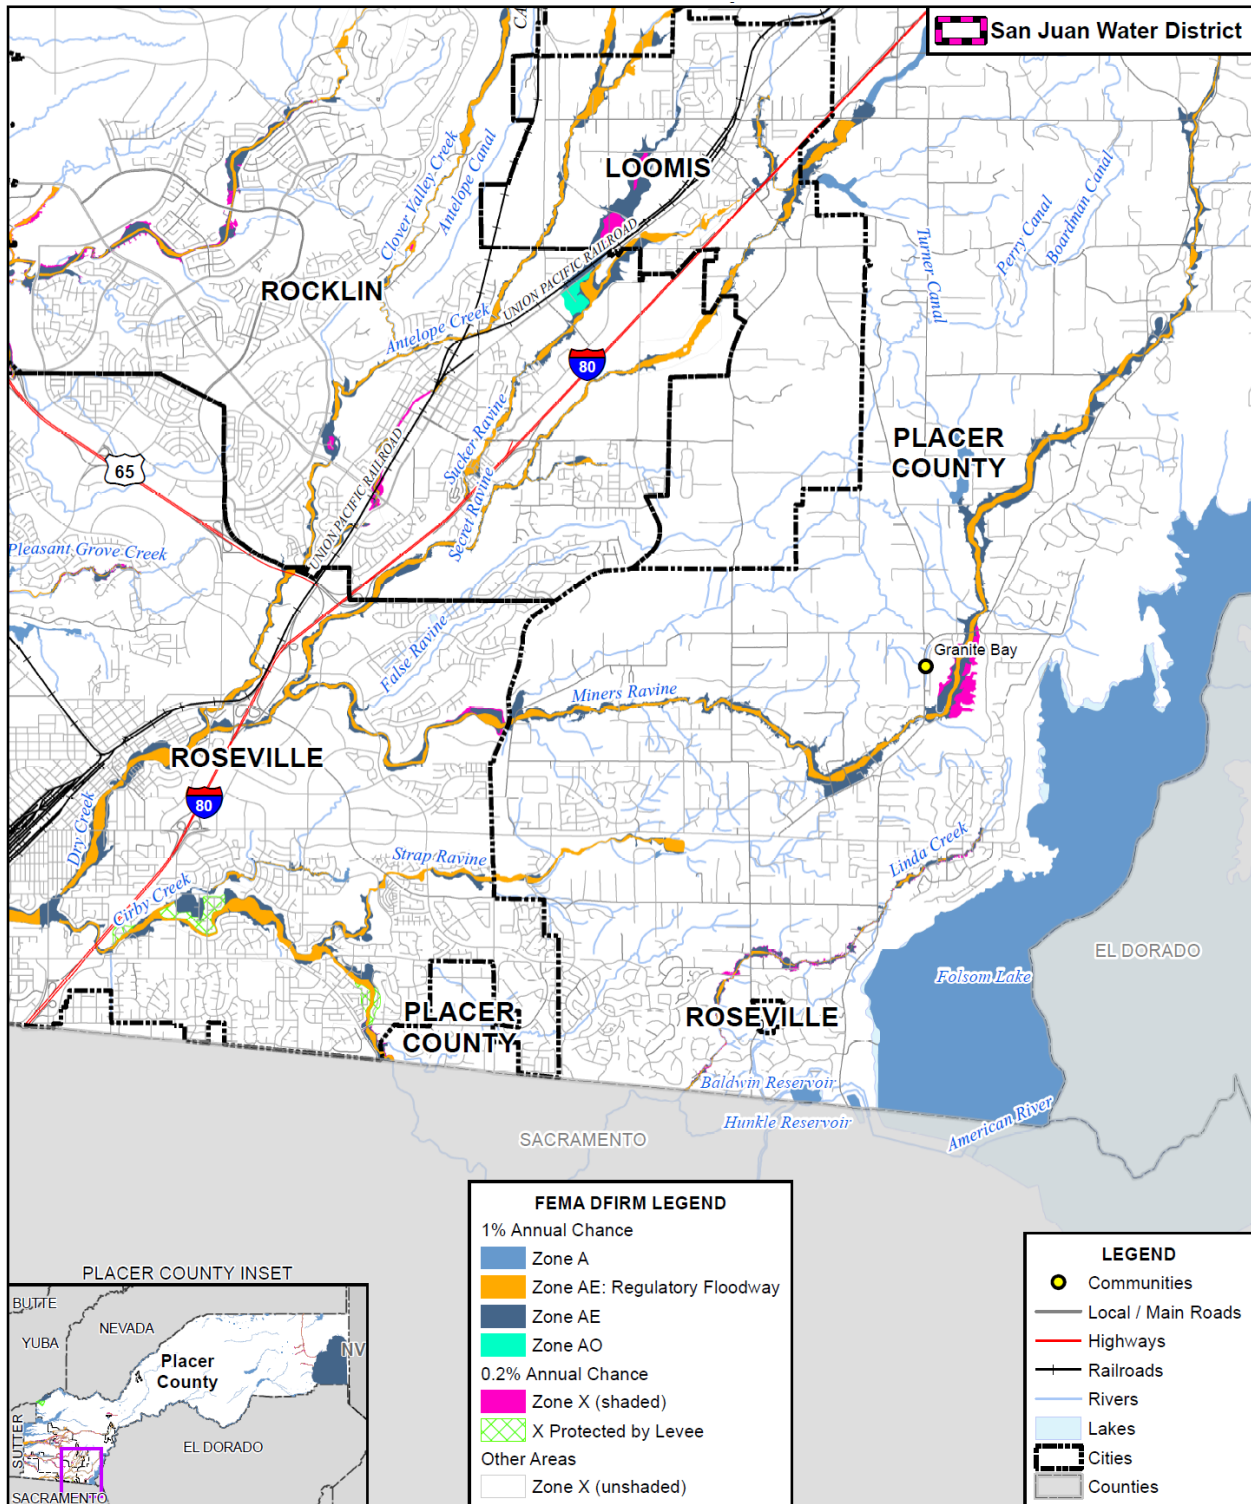

This hazard analyzes the FEMA DFIRM 1% and 0.2% annual chance floods. These tend to be the larger floods that can occur in the County or in the District, and have caused damages in the past. Flooding is a significant problem in Placer County and the District. Historically, the District has been at risk to flooding primarily during the winter and spring months when river systems in the County swell with heavy rainfall and snowmelt runoff. Normally, storm floodwaters are kept within defined limits by a variety of storm drainage and flood control measures. Occasionally, extended heavy rains result in floodwaters that exceed normal high-water boundaries and cause damage.

As previously described in Section 4.3.12 of the Base Plan, the Placer County Planning Area and the SJWD have been subject to historical flooding.

Location and Extent

The SJWD has areas located in the 1% and 0.2% annual chance floodplain. This is seen in Figure T-3.

Figure T-3 SJWD – FEMA DFIRM Flood Zones

Data Source: FEMA DFIRM 11/2/2018, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Table T-5 details the DFIRM mapped flood zones within the 1% annual chance flood zone as well as other flood zones located within the District.

Table T-5 SJWD– DFIRM Flood Hazard Zones

Flood Zone	Description	Flood Zone Present in the District
A	Areas subject to inundation by the 1% annual-chance flood event generally determined using approximate methodologies. Because detailed hydraulic analyses have not been performed, no Base Flood Elevations (BFEs) or flood depths are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.	X
AE – Regulatory Floodway	Areas subject to inundation by the 1% annual-chance flood event determined by detailed methods. Base Flood Elevations (BFEs) are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply. Different from AE in that it adds the water course and adjacent lands that must be reserved in order to discharge the base flood without increasing the water surface elevation by more than one foot.	X
AH	An area inundated by 1% annual chance flooding (usually an area of ponding), for which BFEs have been determined; flood depths range from 1 to 3 feet	
AO	Areas subject to inundation by 100-year shallow flooding (usually sheet flow on sloping terrain) where average depths are between one and three feet	
Shaded X	500-year flood the areas between the limits of the 1% annual chance flood and the 0.2-percent-annual-chance (or 500-year) flood	X
X Protected by Levee	An area determined to be outside the 500-year flood and protected by levee from 100-year flood	
X	Areas outside of known floodplains.	X

Source: FEMA

Additionally, flood extents can generally be measured in volume, velocity, and depths of flooding. Expected flood depths in the District vary, depending on the nature and extent of a flood event; specific depths are unknown. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Flooding in the District tends to have a shorter speed of onset, due to the amount of water that flows through the District.

Past Occurrences

A list of state and federal disaster declarations for Placer County from flooding is shown on Table T-6. These events also likely affected the District to some degree.

Table T-6 Placer County – State and Federal Disaster Declarations from Flood 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Flood (including heavy rains and storms)	16	1950, 1955, 1958 (twice), 1962, 1963, 1969, 1973, 1980, 1983, 1986, 1995 (twice), 1997, 2008, 2017	13	1955, 1958, 1962, 1964, 1969, 1983, 1986, 1995 (twice), 1997, 2006 (twice), 2017

Source: Cal OES, FEMA

Vulnerability to and Impacts from Flood

Floods have been a part of the District’s historical past and will continue to be so in the future. During winter months, long periods of precipitation and the timing of that precipitation are critical in determining the threat of flood, and these characteristics further dictate the potential for widespread structural and property damages. Predominantly, the effects of flooding are generally confined to areas near the waterways of the County. As waterways grow in size from local drainages, so grows the threat of flood and dimensions of the threat. This threatens structures in the floodplain. Structures can also be damaged from trees falling as a result of water-saturated soils. Electrical power outages happen, and the interruption of power causes major problems. Loss of power is usually a precursor to closure of governmental offices and community businesses. Roads can be damaged and closed, causing safety and evacuation issues. People may be swept away in floodwaters, causing injuries or deaths.

Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits. Direct impacts, such as drowning, can be limited with adequate warning and public education about what to do during floods. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, loss of environmental resources, and economic impacts.

Assets at Risk

The District noted the following facilities at risk:

- Water pumping stations
- Water Distribution system

Pandemic

Likelihood of Future Occurrence–Likely

Vulnerability–High

Hazard Profile and Problem Description

According to the World Health Organization (WHO), a disease epidemic occurs when there are more cases of that disease than normal. A pandemic is a worldwide epidemic of a disease. A pandemic may occur when a new virus appears against which the human population has no immunity.

A pandemic occurs when a new virus emerges for which people have little or no immunity, and for which there is no vaccine. This disease spreads easily person-to-person, causes serious illness, and can sweep across the country and around the world in a very short time. The U.S. Centers for Disease Control (CDC) and Prevention has been working closely with other countries and the WHO to strengthen systems to detect outbreaks of that might cause a pandemic and to assist with pandemic planning and preparation. An especially severe pandemic could lead to high levels of illness, death, social disruption, and economic loss.

Location and Extent

During a pandemic, the whole of the District, County, and surrounding region is at risk, as pandemic is a regional, national, and international event. The speed of onset of pandemic is usually short, while the duration is variable, but can last for more than a year as shown in the 1918/1919 Spanish Flu. There is no scientific scale to measure the magnitude of pandemic. Pandemics are usually measured in numbers affected by the pandemic, and by number who die from complications from the pandemic.

Past Occurrences

There has been one state and federal disaster declaration due to pandemic, as shown in Table T-7.

Table T-7 Placer County – State and Federal Pandemic Disaster Declarations 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Pandemic	1	2020	1	2020

Source: Cal OES, FEMA

The 20th century saw three outbreaks of pandemic.

- The 1918-1919 Influenza Pandemic (H1N1)
- The February 1957-1958 Influenza Pandemic (H2N2)
- The 1968 Influenza Pandemic (H3N2)

To date, the 21st century has seen two acknowledged pandemics.

- 2009 Swine Flu (H1N1)
- 2019/2020 COVID 19

The San Juan Water District like other organizations was affected by the 2019/2020 Covid-19 pandemic in many ways. District personnel had to modify operations to protect employees and customers from possible exposure. These changes affected how maintenance and construction projects proceeded under the Governor's various executive orders.

Vulnerability to and Impacts from Pandemic

Pandemics have and will continue to have impacts on human health in the region. A pandemic occurs when a new virus emerges for which there is little or no immunity in the human population; the virus causes serious illness and spreads easily from person-to-person worldwide. There are several strategies that public health officials can use to combat a pandemic. Constant surveillance regarding the current pandemic, use of infection control techniques, and administration of vaccines once they become available. Citizens can help prevent the spread of a pandemic by staying home, or "self-quarantining," if they suspect they are infected. Pandemic does not affect the buildings, critical facilities, and infrastructure in the District. Pandemic can have varying levels of impact to the citizens of the District and greater County, depending on the nature of the pandemic.

Impacts could range from school and business closings to the interruption of basic services such as public transportation, health care, and the delivery of food and essential medicines. Hospitalizations and deaths can occur, especially to the elderly or those with pre-existing underlying conditions. As seen with Covid-19, multiple businesses were forced to close temporarily (some permanently), and unemployment rose significantly. Supply chains for food and essentials can be interrupted.

Assets at Risk

Pandemics do not affect District facilities, but can affect District personnel who operate District facilities.

Future Development

Future development is not expected to be significantly impacted by this hazard, though population growth in the District could increase exposure to pandemic, and increase the ability of each disease to be transmitted among the population of the District.

Severe Weather: Extreme Heat

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to FEMA, extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. Heat kills by taxing the human body beyond its abilities. In extreme heat and high humidity, evaporation is slowed, and the body must work extra hard to maintain a normal temperature." Most heat disorders occur because the victim has been overexposed to heat or has over-exercised for his or her age and physical condition. Older adults, young children, and those who are sick or overweight are more likely to succumb to extreme heat.

In addition to the risks faced by citizens of the District, there are risk to the built environment from extreme heat. While extreme heat on its own does not usually affect structure, extreme heat during times of drought can cause wildfire risk to heighten. Extreme heat and high winds can cause power outages and PSPS events, causing issues to buildings in the District.

Extreme Heat and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Location and Extent

Heat is a regional phenomenon and affects the whole of the District. Heat emergencies are often slower to develop, taking several days of continuous, oppressive heat before a significant or quantifiable impact is seen. Heat waves do not strike victims immediately, but rather their cumulative effects slowly affect vulnerable populations and communities. Heat waves do not generally cause damage or elicit the immediate response of floods, fires, earthquakes, or other more "typical" disaster scenarios.

The NWS has in place a system to initiate alert procedures (advisories or warnings) when extreme heat is expected to have a significant impact on public safety. The expected severity of the heat determines whether advisories or warnings are issued. The NWS HeatRisk forecast provides a quick view of heat risk potential over the upcoming seven days. The heat risk is portrayed in a numeric (0-4) and color (green/yellow/orange/red/magenta) scale which is similar in approach to the Air Quality Index (AQI) or the UV Index. This can be seen in Section 4.3.2 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for heat. The District Planning Team noted that since extreme heat is a regional phenomenon, events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.2.

The District has not been affected by the PG&E PSPS events. To date SMUD has not implemented any PSPS events on their distribution system.

Vulnerability to and Impacts from Extreme Heat

The District experiences temperatures in excess of 100°F during the summer and fall months. The temperature moves to 105-110°F in rather extreme situations. During these times, drought conditions may worsen. Also, power outages and PSPS events may occur during these times as well. Health impacts, including loss of life, are the primary concern with this hazard, though economic impacts are also an issue.

Days of extreme heat have been known to result in medical emergencies, and unpredictable human behavior. Periods of extended heat and dryness (droughts) can have major economic, agricultural, and water resources impacts. Extreme heat can also dry out vegetations, making it more vulnerable to wildfire ignitions.

Assets at Risk

No District assets (from Table T-3) are at risk from this hazard. District personnel who work outdoors can be affected.

Severe Weather: Freeze and Snow

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

According to the NWS and the WRCC, winter snowstorms can include heavy snow, ice, and blizzard conditions. Heavy snow can immobilize a region, stranding commuters, stopping the flow of supplies, and disrupting emergency and medical services. Accumulations of snow can collapse roofs and knock down trees and power lines. In rural areas, homes and farms may be isolated for days, and unprotected livestock may be lost. The cost of snow removal, damage repair, and business losses can have a tremendous impact on cities and towns.

Heavy accumulations of ice can bring down trees, electrical wires, telephone poles and lines, and communication towers. Communications and power can be disrupted for days until the damage can be repaired. Power outages can have a significant impact on communities, especially critical facilities such as public utilities. Even small accumulations of ice may cause extreme hazards to motorists and pedestrians.

Some winter storms are accompanied by strong winds, creating blizzard conditions with blinding wind-driven snow, severe drifting, and dangerous wind chills. Strong winds accompanying these intense storms and cold fronts can knock down trees, utility poles, and power lines. Blowing snow can reduce visibility to only a few feet in areas where there are no trees or buildings. Serious vehicle accidents with injuries and deaths can result. Freezing temperatures can cause significant damage to the agricultural industry.

Location and Extent

Freeze and snow are regional issues, meaning the entire District is at risk to cold weather and freeze events. While there is no scale (i.e. Richter, Enhanced Fujita) to measure the effects of freeze, the WRCC reports that in a typical year, minimum temperatures fall below 32°F on 22.6 days with 0 days falling below 0°F in western Placer County. Snowfall is measured in depths, and the WRCC reports that average snowfall on the western side of the County is 1.4 inches. Freeze and snow has a slow onset and can generally be predicted in advance for the County. Freeze events can last for hours (in a cold overnight), or for days to weeks at a time. Snow event can last for hours or days, but is more unlikely in the western portion of the County. When it does snow, the snow often melts relatively quickly.

Past Occurrences

There has been no federal and one state disaster declarations in the County for freeze and snow, as shown on Table T-8.

Table T-8 Placer County – State and Federal Disaster Declarations from Freeze and Snow 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Freeze	1	1972	0	–

Source: Cal OES, FEMA

The District noted that cold and freeze is a regional phenomenon; events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.3.

Vulnerability to and Impacts from Severe Weather: Freeze and Snow

The District experiences temperatures below 32 degrees during the winter months. Freeze can cause injury or loss of life to residents of the District. While it is rare for buildings to be affected directly by freeze, damages to pipes that feed building can be damaged during periods of extreme cold. Freeze and snow can occasionally be accompanied by high winds, which can cause downed trees and power lines, power outages, accidents, and road closures. Transportation networks, communications, and utilities infrastructure are the most vulnerable physical assets to impacts of severe winter weather in the County.

Assets at Risk

The District noted the following facilities at risk:

- Water Treatment Plant

Severe Weather: Heavy Rains and Storms (Hail, Lightning)

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Storms in the District occur annually and are generally characterized by heavy rain often accompanied by strong winds and sometimes lightning and hail. Approximately 10 percent of the thunderstorms that occur each year in the United States are classified as severe. A thunderstorm is classified as severe when it contains one or more of the following phenomena: hail that is three-quarters of an inch or greater, winds in excess of 50 knots (57.5 mph), or a tornado. Heavy precipitation in the District falls mainly in the fall, winter, and spring months in the western side of the County and primarily in the fall and spring in the eastern side of the County.

Location and Extent

Heavy rain events occur on a regional basis. Rains and storms can occur in any location of the District. All portions of the District are at risk to heavy rains. Most of the severe rains occur during the fall, winter, and spring months. There is no scale by which heavy rains and severe storms are measured. Magnitude of storms is measured often in rainfall and damages. The speed of onset of heavy rains can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of severe storms in California, Placer County, and the District can range from minutes to hours to days. Information on precipitation extremes can be found in Section 4.3.4 of the Base Plan.

Past Occurrences

There have been past disaster declarations from heavy rains and storms, which were discussed in Past Occurrences of the flood section above. According to historical hazard data, severe weather, including heavy rains and storms, is an annual occurrence in the District. This is the cause of many of the federal disaster declarations related to flooding.

The District noted an event that occurred on May 14, 2015. The District's water treatment plant at 9935 Auburn-Folsom Road was hit by lightning. Damages to various electrical systems for the pumps and other electric motors the District uses were reported. Fortunately, only minor impacts occurred, mostly due to available redundant systems the District maintains. \$4,700 in damages were reported.

Vulnerability to and Impacts from Heavy Rain and Storms

Heavy rain and severe storms are the most frequent type of severe weather occurrences in the District. These events can cause localized flooding. Elongated events, or events that occur during times where the ground is already saturated can cause 1% and 0.2% annual chance flooding. Wind often accompanies these storms and has caused damage in the past. Hail and lightning are rare in the District.

Actual damage associated with the effects of severe weather include impacts to property, critical facilities (such as utilities), and life safety. Heavy rains and storms often result in localized flooding creating

significant issues. Roads can become impassable and ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Floodwaters and downed trees can break utilities and interrupt services.

During periods of heavy rains and storms, power outages can occur. These power outages can affect pumping stations and lift stations that help alleviate flooding. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Assets at Risk

The District noted the following facilities at risk:

- Water Treatment Plant
- Pumping stations
- Water Distribution system
- Water Storage facilities

Severe Weather: High Winds and Tornadoes

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

High winds, as defined by the NWS glossary, are sustained wind speeds of 40 mph or greater lasting for 1 hour or longer, or winds of 58 mph or greater for any duration. High winds can cause significant property and crop damage, threaten public safety, and have adverse economic impacts from business closures and power loss. High winds can also cause PSPS events.

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes form when cool, dry air sits on top of warm, moist air. Tornadoes are the most powerful storms that exist. Tornadoes, though rare, are another severe weather hazard that can affect areas of the Placer County Planning Area, primarily during the rainy season in the late fall, winter, and early spring, primarily in the western part of the County.

Location and Extent

The entire District is subject to significant, non-tornadic (straight-line), winds. Each area of the County is at risk to high winds. Magnitude of winds is measured often in speed and damages. These events are often part of a heavy rain and storm event, but can occur outside of storms. The speed of onset of winds can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of winds in California is often short, ranging from minutes to hours. The Beaufort scale is an empirical 12 category scale that relates wind speed to observed conditions at sea or on land. Its full name is the Beaufort Wind Force Scale. The Beaufort Scale was shown in Section 4.3.5 of the Base Plan.

Portions of the County are also located in a special wind hazard region, which is a result of foehn winds. A foehn wind is a type of dry down-slope wind that occurs in the lee (downwind side) of a mountain range. Winds of this type are called "snow-eaters" for their ability to make snow melt or sublimate rapidly. This snow-removing ability is caused not only by warmer temperatures, but also the low relative humidity of the air mass coming over the mountain(s). They are also associated with the rapid spread of wildfires, making some regions which experience these winds particularly fire prone.

Tornadoes, while rare, can occur at any location in the County and District, but would more likely occur in Western Placer. Prior to February 1, 2007, tornado intensity was measured by the Fujita (F) scale. This scale was revised and is now the Enhanced Fujita scale. Both scales are sets of wind estimates (not measurements) based on damage. The new scale (EF) provides more damage indicators (28) and associated degrees of damage, allowing for more detailed analysis and better correlation between damage and wind speed. It is also more precise because it considers the materials affected and the construction of structures damaged by a tornado. The F Scale and EF Scale are shown in Section 4.3.5 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for winds and tornadoes. The District noted that since high winds is a regional phenomenon, events that affected the lower elevations of the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.5.

Vulnerability to and Impacts from Severe Weather: Wind and Tornado

High winds are common occurrences in the District throughout the entire year. Straight line winds are primarily a public safety and economic concern. Windstorm can cause damage to structures and power lines which in turn can create hazardous conditions for people. Debris flying from high wind events can shatter windows in structures and vehicles and can harm people that are not adequately sheltered. High winds can impact critical facilities and infrastructure and can lead to power outages. Wind can also drive wildfire flames, spreading wildfires quickly. During periods of high winds and dry vegetation, wildfire risk increases. High winds that occur during periods of extreme heat can cause PSPS events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Impacts from high winds in the District will vary. Future losses from straight line winds include:

- Downed trees
- Power line impacts and economic losses from power outages
- Increased PSPS events
- Occasional building damage, primarily to roofs

Assets at Risk

The District noted the following facilities at risk:

- Water Treatment Plant
- Pumping stations

Wildfire

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

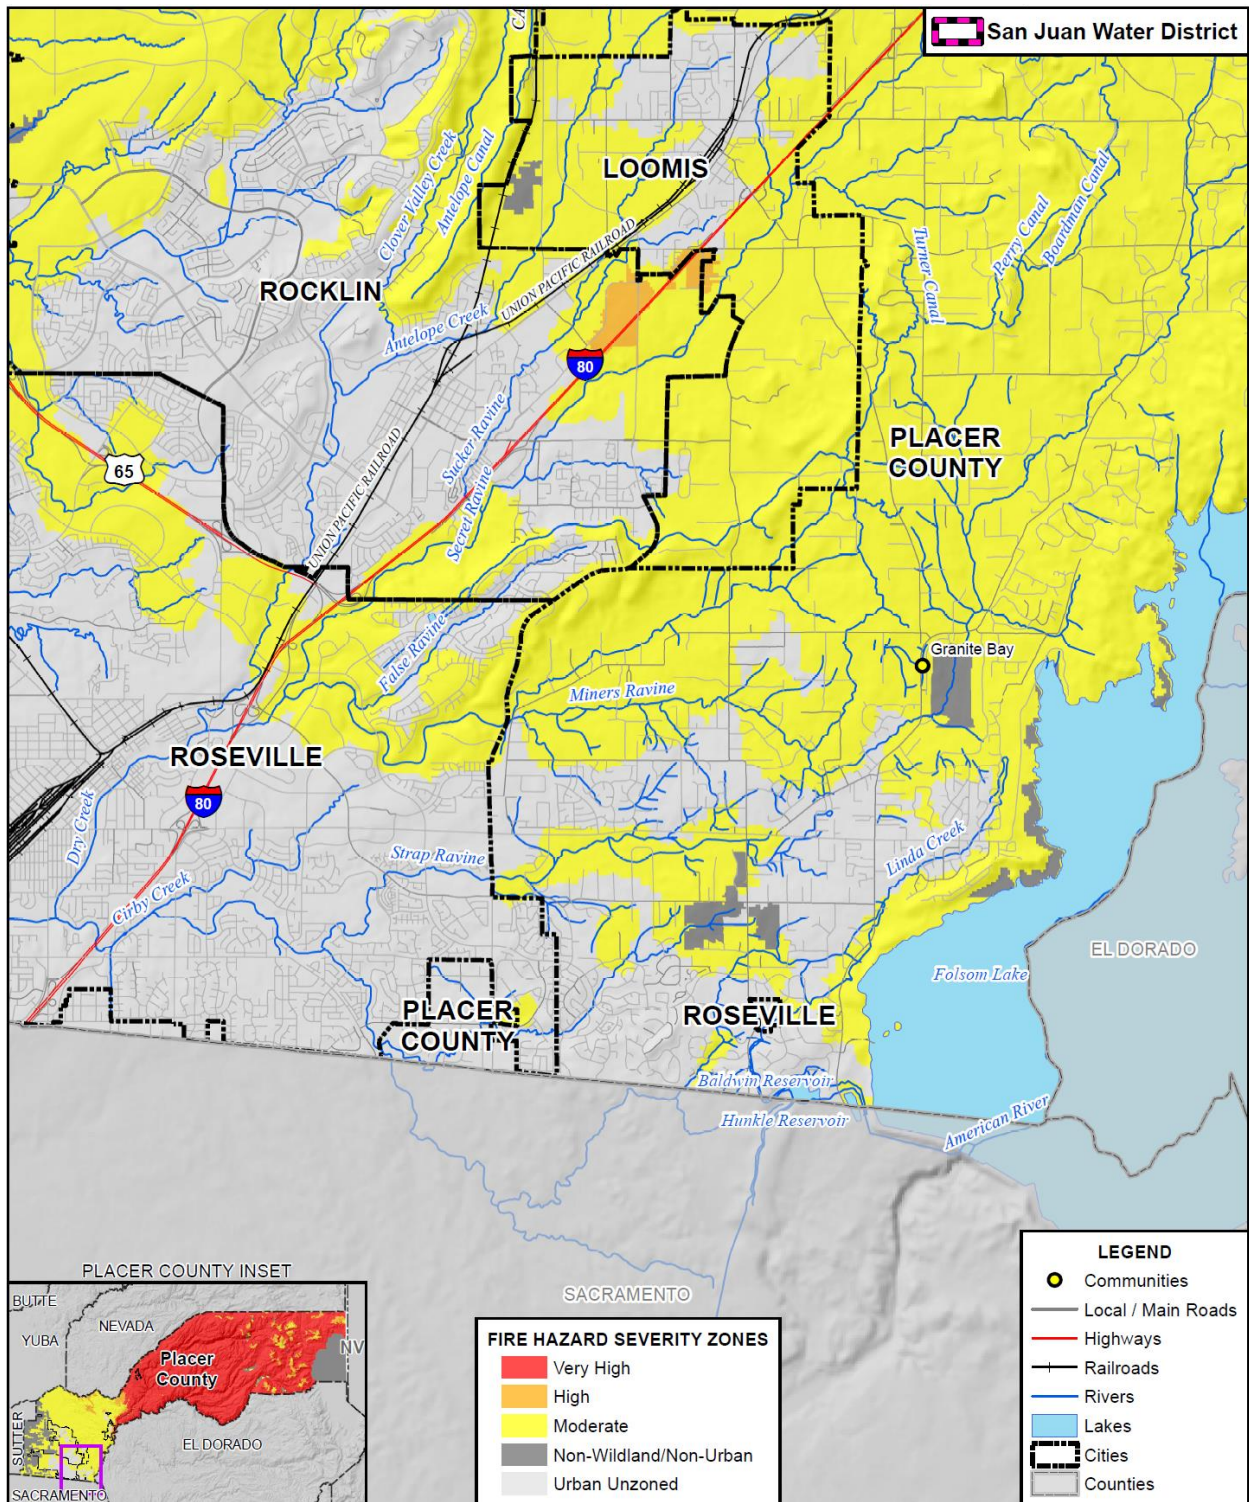

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the SJWD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the SJWD were created. Figure T-4 shows the CAL FIRE FHSZ in the District. As shown on the maps, FHSZs within the District range from Urban Unzoned to Moderate.

Figure T-4 SJWD – Fire Hazard Severity Zones

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table T-9.

Table T-9 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage

and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

Assets at Risk

The District noted the following facilities at risk:

- Main Campus/Yard

T.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

T.6.1. Regulatory Mitigation Capabilities

Table T-10 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the SJWD.

Table T-10 SJWD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	N	See Placer County.
Capital Improvements Plan	Y	District specific plan
Economic Development Plan	Y	District specific plan
Local Emergency Operations Plan	N	See Placer County.
Continuity of Operations Plan	Y	District specific plan
Transportation Plan	N	See Placer County.
Stormwater Management Plan/Program	N	See Placer County.
Engineering Studies for Streams	N	See Placer County.
Community Wildfire Protection Plan	N	See Placer County.
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	Y	District specific Urban Water Management Plan
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	N	Version/Year:

Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	
Is the ordinance an effective measure for reducing hazard impacts?		
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	N	See Placer County
Subdivision ordinance	N	See Placer County
Floodplain ordinance	N	See Placer County
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	See Placer County
Flood insurance rate maps	N	See Placer County
Elevation Certificates	N	See Placer County
Acquisition of land for open space and public recreation uses	N	See Placer County
Erosion or sediment control program	N	See Placer County
Other	N	See Placer County
How can these capabilities be expanded and improved to reduce risk?		
Regular planning and implementation of risk reduction measures are included into most if not all operations. The Agency has multiple cooperative partnerships that help enhance these capabilities. Additional grant funding could increase risk reduction, but limited staff hinders the Districts grant writing capabilities.		

Source: SJWD

T.6.2. Administrative/Technical Mitigation Capabilities

Table T-11 identifies the District department(s) responsible for activities related to mitigation and loss prevention in SJWD.

Table T-11 SJWD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	See Placer County
Mitigation Planning Committee	N	See Placer County
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	See Placer County
Mutual aid agreements	Y	SJWD has mutual aid agreements with other agencies
Other		
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	N	See Placer County
Floodplain Administrator	N	See Placer County

Emergency Manager	N	See Placer County
Community Planner	N	See Placer County
Civil Engineer	Y	Staff has some training on hazards and mitigation
GIS Coordinator	Y	Staff has some training on hazards and mitigation
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Access to Placer county system
Hazard data and information	N	See Placer County
Grant writing	N	See Placer County
Hazus analysis	N	See Placer County
Other		
How can these capabilities be expanded and improved to reduce risk?		
The Agency has a working relationship with the County for planning and emergency services. The District has developed its own safety department and is in the process of updating its Emergency Response Plan, and Vulnerability Assessment.		

Source: SJWD

T.6.3. Fiscal Mitigation Capabilities

Table T-12 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table T-12 SJWD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	
Authority to levy taxes for specific purposes	N	
Fees for water, sewer, gas, or electric services	Y	Fees are set based on cost of service
Impact fees for new development	Y	The District receives capacity fees used to expand the water system
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	N	
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	Y	Sources have not been used in the past.
State funding programs	Y	State Revolving Loan Funding
Insurance	Y	Used for replacement and mitigation of existing hazard conditions after loss.

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
How can these capabilities be expanded and improved to reduce risk?		
If funding were available, additional planning division staffing would greatly improve SJWD’s ability to increase vulnerability awareness and help plan for future mitigation programs. The District will seek FEMA, DWR, Cal OES, and other funding sources to increase mitigation capabilities.		

Source: SJWD

T.6.4. Mitigation Education, Outreach, and Partnerships

Table T-13 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table T-13 SJWD’s Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	SJWD water conservation programs.
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Ongoing communication and coordination throughout traditional and social media platforms. THE SJWD conservation program will be expanded if additional revenue becomes available.		

Source: SJWD

T.6.5. Other Mitigation Efforts

The District is involved in a variety of mitigation activities including public outreach and project activities. These mitigation activities include:

- Public Service Advertisements
- Water Conservation (public outreach) program
- Website Newsletters to the general public

- The District’s Water Conservation program includes residential programs and rebates for: high efficiency clothes washing machines, point of use hot water heater, weather based irrigation controllers, free mulch distribution, and water wise house calls.

T.7 Mitigation Strategy

T.7.1. Mitigation Goals and Objectives

The SJWD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

T.7.2. Mitigation Actions

The planning team for the SJWD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Climate Change
- Dam Failure
- Drought & Water Shortage
- Earthquake
- Floods: 1%/0.2% annual chance
- Pandemic
- Severe Weather: Extreme Heat
- Severe Weather: Freeze and Snow
- Severe Weather: Heavy Rains and Storms
- Severe Weather: High Winds and Tornadoes
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Updating the 2015 Urban Water Management Plan

Hazards Addressed: Climate Change, Drought and Water Storage Hazards, Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Urban water suppliers having more than 3,000 service connections or supplying more than 3,000 acre-feet per year (AFY) for retail or wholesale uses are required to submit an UWMP every five years to the California Department of Water Resources (DWR). The Urban Water Management Planning Act (Act) requires urban water suppliers to describe and evaluate sources of water supply, efficient uses of water, demand management measures (DMMs), implementation strategy and schedule, and other relevant information and programs. An UWMP is required in order for a water supplier to be eligible for DWR administered state grants and loans and for drought assistance.

Project Description: The Act requires reporting agencies to describe its water supply reliability under single dry-year, multiple dry-year, and average year conditions, with projected information in five-year increments for a minimum of 20 years. One of the purposes of this UWMP is to ensure the efficient use of available water supplies, as required by the Act. The Act states that urban water suppliers should make every effort to assure the appropriate level of reliability in its water service sufficient to meet the needs of its various categories of customers during normal, dry, and multiple dry years. The UWMP describes the availability of water and discusses water use, reclamation, and water conservation activities. This UWMP concludes that the water supplies available to the District's retail and wholesale customer agencies are adequate over the next 25- year planning period

Other Alternatives:

Existing Planning Mechanism(s) through which Action Will Be Implemented: Complete update of Urban Water Master Plan

Responsible Agency/ Department/Partners: SJWD

Cost Estimate: Various

Benefits (Losses Avoided): Reduced risk to drought and water shortage due to climate change.

Potential Funding: SJWD – DWR Grants

Timeline: Within 2021

Project Priority (H, M, L): Medium

Action 2. Dam Failure Mitigation

Hazards Addressed: Dam Failure – Hinkle Reservoir, Flood, Heavy Rains and Storms

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: A dam failure can range from a small uncontrolled release to a catastrophic failure, caused by prolonged failure of the containment levee. The primary danger associated with dam failure is the flooding of those properties located within the inundation zone of the dam. Dam failure flooding varies by area depending on which dam fails and the nature and extent of the dam failure and associated flooding. The dam was built in 1980 and is the rock fill-earth core dam with 1300 ft. crest length.

Project Description: Replacement of reservoir hypalon liner and inspection and modifications to outlet structures

Other Alternatives: No action

Existing Planning Mechanisms through which Action will be Implemented: Dam Failure EAP

Responsible Office: San Juan Water District and California Department of Water Resources Division of Safety of Dams

Priority (H, M, L): M

Cost Estimate: 18,425,000

Potential Funding: Various sources

Benefits (avoided Losses): Reduces risk of facility failure

Schedule: Complete by 2022

Action 3. Earthquake Mitigation

Hazards Addressed: Earthquake

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Project Description: Earthquake damage to water treatment plant, distribution pump station both above and below ground water distribution mains.

Issue/Background: Various facilities have the potential to be damaged in an earthquake

Other Alternatives: No action

Existing Planning Mechanisms through which Action will be Implemented: Strengthening of facilities when replacing or upgrading facilities when upgrades to existing facilities occurs.

Responsible Office: SJWD

Priority (H, M, L): L

Cost Estimate: Project dependent

Potential Funding: Capitol project funding and grants if available

Benefits (avoided Losses): More resilient facilities

Schedule: On-going

Action 4. Redundant/Backup Power System

Hazards Addressed: Climate Change, Extreme heat, freeze and winds

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The San Juan Water District administration building currently has no back up power source.

This recently became an issue due to the initiation of the Public Safety Power Shutoff (PSPS) events that have affected our area. Since the PSPS event can last a number of days they can disrupt the administration of our district. The increased likelihood of power outages caused by more frequent severe weather is also a factor that the District needs to consider

Project Description: This project would be to install a backup power source for the District's administration building. Two options would be explored, the first would be a solar array with battery storage or a diesel/natural gas emergency generator.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: San Juan Water District Engineering Department

Responsible Agency/ Department/Partners: San Juan Water District, Operation Department

Cost Estimate: \$750,000

Benefits (Losses Avoided): Increase administrative capabilities during PSPS events or other severe weather caused power outages

Potential Funding: FEMA grant Funding

Timeline: 24 months

Project Priority (H, M, L): High

Action 5. Water Main Bridge Crossing Replacement/Strengthening

Hazards Addressed: Wildfire, Climate Change

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The San Juan Water District has a number of water distribution mains that are attached to over crossings and bridges in our service area. Many of these mains are decades old and are undersized for the growth that has taken place since they were originally installed.

Project Description: This project would be to either strengthen the existing water main crossing or when possible, replace the existing main with a larger capacity line to increase water availability for increase fire hydrant flows and increase capacity for existing interties with other agencies.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: San Juan Water District Engineering Department

Responsible Agency/ Department/Partners: San Juan Water District, Water Distribution Department

Cost Estimate: \$500,000

Benefits (Losses Avoided): Increased water capacities and more resilient system

Potential Funding: FEMA grant Funding

Timeline: 48 months

Project Priority (H, M, L): High

Annex U Sierra Joint Community College District

U.1 Introduction

This Annex details the hazard mitigation planning elements specific to Sierra Joint Community College District (SJCCD or District), a new participating jurisdiction to the 2021 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to SJCCD, with a focus on providing additional details on the risk assessment and mitigation strategy for this community.

Note: SJCCD participated in the original 2005 Placer County LHMP. A copy of that document could not be located by SJCCD, Placer County, or Cal OES. Additionally, staff turnover in the past 16 years has reduced institutional memory of that 2005 Plan. It can be assumed that none of SJCCD’s proposed mitigation actions were completed, SJCCD’s mitigation priorities at that time are unknown, and that the 2005 Plan was not incorporated into any SJCCD planning mechanisms. Development in the District since 2005 was described by SJCCD as minimal, and a general description of more recent development in the District is included in Section U.5.2 of this Annex.

U.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table U-1. Additional details on plan participation and District representatives are included in Appendix A.

Table U-1 SJCCD – Planning Team

Name	Position/Title	How Participated
Erik Skinner	Vice President, Administrative Services	Coordination, planning, drafting
Linda Fisher	Director of Finance	Planning, drafting
Laura Doty	Director of Facilities	Planning, drafting
Judy Alquist	Director of Budget	Planning, drafting
Jamison Lopizich	Chief of Security	Planning, drafting
Stacey Carroll	Executive Assistant, Administrative Services	Coordination, planning, drafting

U.3 District Profile

The District profile for the SJCCD is detailed in the following sections. Figure U-1 displays a map and the location of the District within Placer County.

Figure U-1 SJCCD

FOSTER MORRISON
CONSULTING

0 0.25 0.5 Miles

COUNTY OF
Placer

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

U.3.1. Overview and Background

Sierra College is a public community college in Rocklin, California. Sierra College is owned and operated by the Sierra Joint Community College District, a district that covers over 3,200 square miles, serves Placer, Nevada and parts of El Dorado and Sacramento counties.

The college was officially founded in 1936 and is fully accredited by the Western Association of Schools and Colleges. The main campus in Rocklin was chosen by 1960, out of 35 possible sites. The planned construction of Interstate 80 was a consideration in the decision making. In 1961, the new campus opened. In 1996, another campus in Nevada County opened, in between Grass Valley and Nevada City. During 2000–2005, outreach campuses in Roseville and near Truckee were opened. Today the SJCCD serves over 24,000 students.

SJCCD is governed by a board of seven trustees who are elected district-wide and a student trustee. The constituent groups within the district—trustees, faculty, students, management and classified staff—are committed to our mission of providing education and opportunity to area residents. The principle of participatory governance for assuring broad and deep participation in all decisions is a defining feature of the college and district. SJCCD is proud of our tradition of strong and stable leadership with only five individuals having held the post of president in the last 50 years and a board with long tenures of service.

U.4 Hazard Identification

SJCCD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table U-2).

Table U-2 SJCCD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Limited	Unlikely	Negligible	Low	Medium
Avalanche	Limited	Unlikely	Negligible	Low	Medium
Climate Change	Extensive	Likely	Limited	Low	–
Dam Failure	Limited	Unlikely	Limited	Low	Medium
Drought & Water Shortage	Extensive	Unlikely	Negligible	Medium	High
Earthquake	Significant	Occasional	Limited	Low	Low
Floods: 1%/0.2% annual chance	Significant	Unlikely	Limited	Low	Medium
Floods: Localized Stormwater	Limited	Likely	Negligible	Medium	Medium
Landslides, Mudslides, and Debris Flows	Limited	Unlikely	Limited	Low	Medium
Levee Failure	Limited	Unlikely	Limited	Low	Medium
Pandemic	Extensive	Likely	Critical	High	Medium
Seiche	Limited	Unlikely	Negligible	Low	Medium
Severe Weather: Extreme Heat	Extensive	Likely	Limited	Low	High
Severe Weather: Freeze and Snow	Extensive	Likely	Limited	Low	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Likely	Limited	Low	Medium
Severe Weather: High Winds and Tornadoes	Significant	Occasional	Negligible	Low	Low
Tree Mortality	Significant	Occasional	Limited	Low	High
Wildfire	Significant	Occasional	Limited	Medium	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

U.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District's hazards and assess the District's vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

U.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 0, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table U-2) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

U.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District's total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the SJCCD's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table U-3 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. SJCCD’s physical assets, valued at over \$481 million, consist of the buildings and infrastructure to support the District’s operations.

Table U-3 SJCCD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
Rocklin Campus	Classrooms, Offices, Student Services, Dorm, Server Room	\$350 million	Earthquake, Flooding, Stormwater Flooding, Severe Weather, Tree Mortality and Wildfire
Nevada County Campus	Classrooms, Offices, Student Services, Public Safety Training Center, Server Room	\$100 million	Earthquake, Flooding, Stormwater Flooding, Severe Weather, Tree Mortality and Wildfire
Tahoe-Truckee Campus	Classrooms, Offices, Student Services, Server Room	\$25 million	Earthquake, Flooding, Stormwater Flooding, Severe Weather, Tree Mortality and Wildfire
Roseville Leased Space	Classroom and Office Contents, Server Room	\$6 million	Earthquake, Flooding, Stormwater Flooding

Source: SJCCD

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. SJCCD provides services to over 24,000 students.

Natural Resources

SJCCD has a variety of natural resources of value to the District. These natural resources parallel that of the City of Rocklin. Information can be found in Section 4.3.1 of the Base Plan

Historic and Cultural Resources

SJCCD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of the City of Rocklin. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

General growth in the District parallels that of the City of Rocklin. Information can be found in Section 4.3.1 of the Base Plan.

Future Development

The District is currently implementing a \$500 million construction program for the Rocklin Campus, funded primarily through the passage of the Measure E bond authorization. Part of this work includes a West Placer Transfer Center that will be built in conjunction with Sacramento State University's new center at Placer Ranch. More general information on growth and development in Placer County as a whole can be found in "Growth and Development Trends" in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

U.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table U-2 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Drought & Water Shortage

Likelihood of Future Occurrence–Unlikely

Vulnerability–Medium

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area’s usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table U-4.

Table U-4 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

The District experienced moderate loss of landscaping (plants, shrubs, turf, etc.) during the 2014 drought.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

Identified vulnerabilities include moderate loss of landscaping (plants, shrubs, turf, etc.). To mitigate these risks and contribute to regional water conservation efforts, the District has developed a Landscape Master Plan for the Rocklin Campus that incorporates low-water, drought tolerant design.

Assets at Risk

There are no identified threats to assets listed in table U-3, damage would likely be limited to landscaping.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Flooding occurs in areas other than the FEMA mapped 1% and 0.2% annual chance floodplains. Flooding may be from drainages not studied by FEMA, lack of or inadequate drainage infrastructure, or inadequate maintenance. Localized, stormwater flooding occurs throughout the County during the rainy season from

November through April. Prolonged heavy rainfall contributes to a large volume of runoff resulting in high peak flows of moderate duration.

Location and Extent

The SJCCD is subject to localized flooding throughout the District. Flood extents are usually measured in areas affected, velocity of flooding, and depths of flooding. Expected flood depths in the District vary by location. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Localized flooding in the District tends to have a shorter speed of onset, especially when antecedent rainfall has soaked the ground and reduced its capacity to absorb additional moisture.

Past Occurrences

There have been no federal or state disaster declarations in the County due to localized flooding. The District noted the following past occurrences of localized flooding:

- **January 3-12, 2017** – Flooding from heavy rains occurred at the Rocklin, Roseville, Grass Valley, and Tahoe-Truckee campuses. Campuses were closed intermittently between January 3 & 12. Disaster No: FEMA DR-4301 Heavy rains and high winds causing damage to buildings and roofs, fallen trees, debris and localized flooding. Various intermittent campus closures due to severe weather, power outages and flying debris. Flooded elevator shaft, roof damage on several buildings, overwhelmed drains in pool complex, overwhelmed roof drains, water intrusion, fallen or damaged trees. These losses were not insured losses, since origin of most damage was flood water related.

Vulnerability to and Impacts from Localized Flooding

Historically, much of the growth in the District and County has occurred adjacent to streams, resulting in significant damages to property, and losses from disruption of community activities when the streams overflow. Additional development in the watersheds of these streams affects both the frequency and duration of damaging floods through an increase in stormwater runoff.

Primary concerns associated with stormwater flooding include life safety issues, and impacts to property and to infrastructure that provides a means of ingress and egress throughout the community. Ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Objects can also be buried or destroyed through sediment deposition. Floodwaters can break utility lines and interrupt services. Standing water can cause damage to crops, roads, and foundations. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

Assets at Risk

All District assets (from Table U-3) are at risk from this hazard. District personnel may be affected as they travel to and from work, as transportation routes may be affected.

Pandemic

Likelihood of Future Occurrence–Likely

Vulnerability–High

Hazard Profile and Problem Description

According to the World Health Organization (WHO), a disease epidemic occurs when there are more cases of that disease than normal. A pandemic is a worldwide epidemic of a disease. A pandemic may occur when a new virus appears against which the human population has no immunity.

A pandemic occurs when a new virus emerges for which people have little or no immunity, and for which there is no vaccine. This disease spreads easily person-to-person, causes serious illness, and can sweep across the country and around the world in a very short time. The U.S. Centers for Disease Control (CDC) and Prevention has been working closely with other countries and the WHO to strengthen systems to detect outbreaks of that might cause a pandemic and to assist with pandemic planning and preparation. An especially severe pandemic could lead to high levels of illness, death, social disruption, and economic loss.

Location and Extent

During a pandemic, the whole of the District, County, and surrounding region is at risk, as pandemic is a regional, national, and international event. The speed of onset of pandemic is usually short, while the duration is variable, but can last for more than a year as shown in the 1918/1919 Spanish Flu. There is no scientific scale to measure the magnitude of pandemic. Pandemics are usually measured in numbers affected by the pandemic, and by number who die from complications from the pandemic.

Past Occurrences

There has been one state and federal disaster declaration due to pandemic, as shown in Table U-5.

Table U-5 Placer County – State and Federal Pandemic Disaster Declarations 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Pandemic	1	2020	1	2020

Source: Cal OES, FEMA

The 20th century saw three outbreaks of pandemic flu.

- The 1918-1919 Influenza Pandemic (H1N1)
- The February 1957-1958 Influenza Pandemic (H2N2)
- The 1968 Influenza Pandemic (H3N2)

To date, the 21st century has seen two acknowledged pandemics.

- 2009 Swine Flu (H1N1)
- 2019/2020 COVID 19

In the District, the COVID-19 Pandemic resulted in a severe disruption to campus operations. It affected the Rocklin, Roseville, Grass Valley, and Tahoe-Truckee campuses. As of January 25, 2021, approximately 21 positive tests reported among on-site employees and students. Beginning in March 2020, roughly 95% of instruction converted to online delivery. Operations converted to a largely remote model. Continuing in this manner in spring of 2021 and into the foreseeable future. No community transmissions of the virus have occurred on site. No deaths have occurred among on-site employees and students.

Vulnerability to and Impacts from Pandemic

Pandemics have and will continue to have impacts on human health in the region. A pandemic occurs when a new virus emerges for which there is little or no immunity in the human population; the virus causes serious illness and spreads easily from person-to-person worldwide. There are several strategies that public health officials can use to combat a pandemic. Constant surveillance regarding the current pandemic, use of infection control techniques, and administration of vaccines once they become available. Citizens can help prevent the spread of a pandemic by staying home, or “self-quarantining,” if they suspect they are infected. Pandemic does not affect the buildings, critical facilities, and infrastructure in the District. Pandemic can have varying levels of impact to the citizens of the District and greater County, depending on the nature of the pandemic.

Impacts could range from school and business closings to the interruption of basic services such as public transportation, health care, and the delivery of food and essential medicines. Hospitalizations and deaths can occur, especially to the elderly or those with pre-existing underlying conditions. As seen with Covid-19, multiple businesses were forced to close temporarily (some permanently), and unemployment rose significantly. Supply chains for food and essentials can be interrupted. Prisons may need to release prisoners to prevent significant outbreaks.

Assets at Risk

Pandemics do not affect District facilities, but can affect District personnel who operate District facilities.

Severe Weather: Extreme Heat

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to FEMA, extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. Heat kills by taxing the human body beyond its abilities. In extreme heat and high humidity, evaporation is slowed, and the body must work extra hard to maintain a normal temperature.” Most heat disorders occur because the victim has been overexposed to heat or has over-exercised for his or her age and physical condition. Older adults, young children, and those who are sick or overweight are more likely to succumb to extreme heat.

In addition to the risks faced by citizens of the District, there are risk to the built environment from extreme heat. While extreme heat on its own does not usually affect structure, extreme heat during times of drought

can cause wildfire risk to heighten. Extreme heat and high winds can cause power outages and PSPS events, causing issues to buildings in the District.

Extreme Heat and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Location and Extent

Heat is a regional phenomenon and affects the whole of the District. Heat emergencies are often slower to develop, taking several days of continuous, oppressive heat before a significant or quantifiable impact is seen. Heat waves do not strike victims immediately, but rather their cumulative effects slowly affect vulnerable populations and communities. Heat waves do not generally cause damage or elicit the immediate response of floods, fires, earthquakes, or other more "typical" disaster scenarios.

The NWS has in place a system to initiate alert procedures (advisories or warnings) when extreme heat is expected to have a significant impact on public safety. The expected severity of the heat determines whether advisories or warnings are issued. The NWS HeatRisk forecast provides a quick view of heat risk potential over the upcoming seven days. The heat risk is portrayed in a numeric (0-4) and color (green/yellow/orange/red/magenta) scale which is similar in approach to the Air Quality Index (AQI) or the UV Index. This can be seen in Section 4.3.2 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for heat. The District Planning Team noted that since extreme heat is a regional phenomenon, events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.2.

In recent years, PSPS events have impacted campus operations and forced closure of the campuses due to inability to operate building systems.

Vulnerability to and Impacts from Extreme Heat

The District experiences temperatures in excess of 100°F during the summer and fall months. The temperature moves to 105-110°F in rather extreme situations. During these times, drought conditions may worsen. Also, power outages and PSPS events may occur during these times as well. Health impacts, including loss of life, are the primary concern with this hazard, though economic impacts are also an issue.

Days of extreme heat have been known to result in medical emergencies, and unpredictable human behavior. Periods of extended heat and dryness (droughts) can have major economic, agricultural, and water resources impacts. Extreme heat can also dry out vegetations, making it more vulnerable to wildfire ignitions.

During periods of extreme heat, the District takes measures to ensure that facilities and grounds personnel employ safety procedures including hydration, rest breaks, and/or performing indoor duties. In the campus dormitory, each room is equipped with an air conditioning unit. The District plans to purchase and install a generator for the dormitory to ensure continued operation of air conditioners and other building systems in the event of power loss.

Assets at Risk

No District assets (from Table U-3) are at risk from this hazard.

Wildfire

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

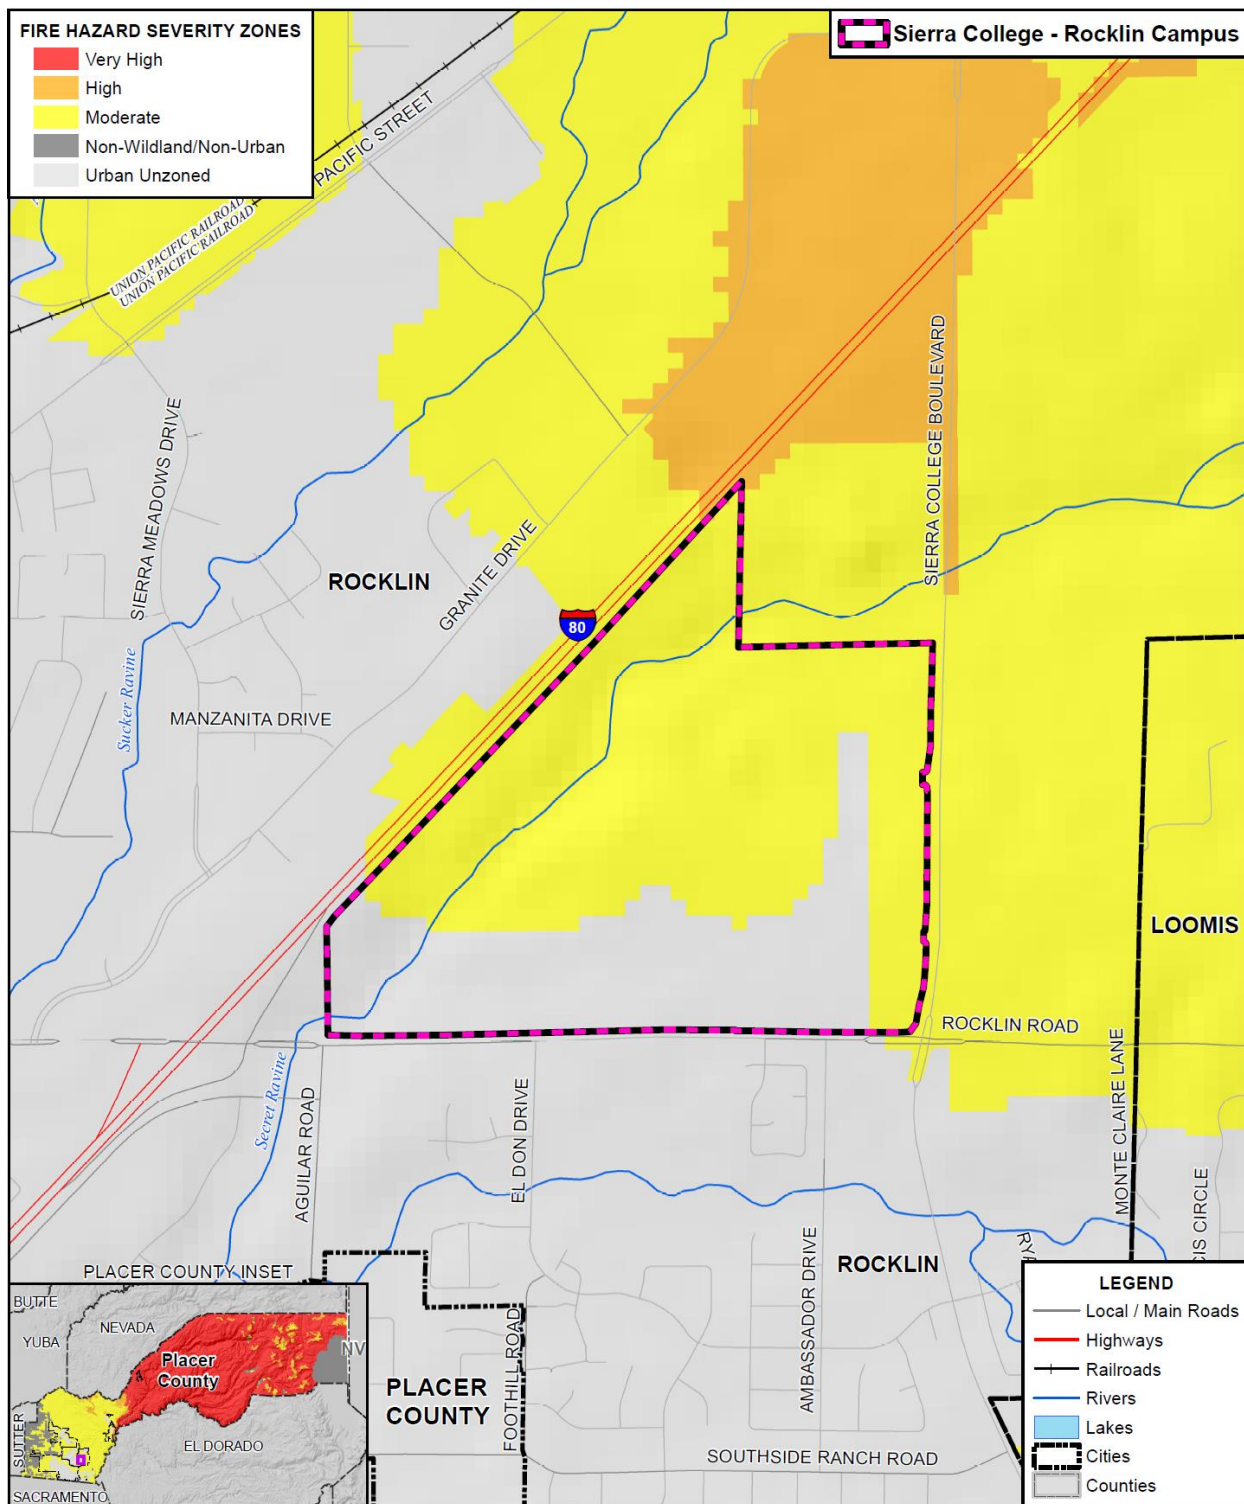

Wildland fire and the risk of a conflagration is an ongoing concern for the SJCCD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures,

low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the SJCCD were created. Figure U-2 shows the CAL FIRE FHSZ in the District. As shown on the maps, FHSZs within the District range from Urban Unzoned to Moderate (though the District borders a High FHSZ).

Figure U-2 SJCCD – Fire Hazard Severity Zones

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table U-6.

Table U-6 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

While no fires have directly threatened the District, wildfires have affected the District in recent years. Campuses have been closed for a total of approximately 8 days over past three years. Wildfires resulting from dry conditions and high winds. Resulted in limited hardship and disruption to campuses due to poor air quality. Campus closures.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic

delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

The District faces potential building loss, and need for campus evacuation and closure. Potential threats to the health and safety of students and employees. District performs annual fuel reduction in nature area with plans to expand these activities in the near future if additional funding can be secured.

Assets at Risk

All District assets (from Table U-3) are at risk from this hazard.

U.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

U.6.1. Regulatory Mitigation Capabilities

Table U-7 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the SJCCD.

Table U-7 SJCCD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	Y	Hazards addressed in campus EIR
Capital Improvements Plan	Y	Facilities Master Plan (all campuses except Roseville)
Economic Development Plan	N	
Local Emergency Operations Plan	Y	Emergency Operations Plan (Rocklin)/COVID-19 Safe Return to Campus Plan
Continuity of Operations Plan	Y	Embedded within EOP
Transportation Plan	Y	Dorm evacuation plan embedded within EOP
Stormwater Management Plan/Program	Y	Pending – in process in response to EIR
Engineering Studies for Streams	n/a	

Community Wildfire Protection Plan	n/a	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	n/a	
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Y	Version/Year: CA Building Code/ADA Various years (1957-2021)
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	
		Is the ordinance an effective measure for reducing hazard impacts?
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	Y	Rocklin campus located in mixed-use zone. Wildfire mitigation required for vacant properties.
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District utilizes the planning processes named above to assess campus needs and develop appropriate responses.		

Source: SJCCD

U.6.2. Administrative/Technical Mitigation Capabilities

Table U-8 identifies the District department(s) responsible for activities related to mitigation and loss prevention in SJCCD.

Table U-8 SJCCD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	

Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Annual fuel reduction activities in the nature area adjacent to the Rocklin Campus (clearing dead wood, brush reduction through mowing and grazing)
Mutual aid agreements	N	
Other		
	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	Y	
Floodplain Administrator	N	
Emergency Manager	Y	
Community Planner	N	
Civil Engineer	N	
GIS Coordinator	N	
Other	N	
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	
Hazard data and information	Y	
Grant writing	Y	
Hazus analysis	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
District plans to expand fuel reduction activities.		

Source: SJCCD

U.6.3. Fiscal Mitigation Capabilities

Table U-9 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table U-9 SJCCD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Capital Project Fund, Bond Fund
Authority to levy taxes for specific purposes	N	
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	N	
Storm water utility fee	N	

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Incur debt through general obligation bonds and/or special tax bonds	Y	
Incur debt through private activities	Y	
Community Development Block Grant	N	
Other federal funding programs	Y	
State funding programs	Y	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Implementation of construction upgrades will result in improved safety systems, including new detection and fire suppression.		

Source: SJCCD

U.6.4. Mitigation Education, Outreach, and Partnerships

Table U-10 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table U-10 SJCCD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	The District conducts ongoing campus safety training programs covering a variety of topics including building evacuation and first aid.
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District continually reviews campus safety trainings to ensure effectiveness and relevance,		

Source: SJCCD

U.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

- Training of Incident Command Team
- Outfitting of Emergency Operation Centers
- Installation of AEDs
- Installation of First Aid Kits
- Installation of emergency generators

U.7 Mitigation Strategy

U.7.1. Mitigation Goals and Objectives

The SJCCD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

U.7.2. Mitigation Actions

The planning team for the SJCCD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Drought and Water Shortage
- Flood: Localized Stormwater Flooding
- Pandemic
- Severe Weather: Extreme Heat
- Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. *Campus safety: fire, earthquake, active shooter, power outage, health emergencies, and pandemics.*

Hazards Addressed: Drought and Water Shortage, Localized Flood, Pandemic, Extreme Heat, Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: There is an ongoing need to provide campus safety trainings covering a variety of topics including building evacuation, active shooter, fire, first aid, and responding to pandemic-related threats. In addition, it is critical to outfit campuses with necessary emergency supplies.

Project Description: This project will mitigate hazards by training staff and students on potential hazards, and seeking ways to respond to those hazards in times of emergencies. There will be an educational component to this mitigation action.

Other Alternatives: Participate in trainings made available by external groups.

Existing Planning Mechanisms through which Action will be Implemented: Review by Safety and Emergency Preparedness Coordinator, input from campus stakeholders, input from community partners

Responsible Office: Safety and Emergency Preparedness Coordinator

Priority (H, M, L): High

Cost Estimate: unknown

Potential Funding: District funds, external grants as available

Benefits (avoided Losses): Avoid and/or mitigate losses to life and property.

Schedule: Ongoing

Action 2. Storm Water Flooding Mitigation

Hazards Addressed: Storm Water Flooding

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Intense rainstorms has the potential to cause flooding on campus.

Project Description: Design and implement storm water management solutions, including retention ponds and drainage systems.

Other Alternatives: Develop more limited and site-specific flood protection solutions such as raising door thresholds, installing ditches, etc.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Facilities Master Planning and Landscape Master Planning

Responsible Agency/ Department/Partners: Sierra College Facilities Department, in conjunction with architectural and construction consultants.

Cost Estimate: \$2 million to \$4 million, depending on number and complexity of storm water management solutions

Benefits (Losses Avoided): Avoid possible flooding damages.

Potential Funding: Bond funds

Timeline: 2021-2027

Project Priority (H, M, L): M

Action 3. Drought Tolerant Landscaping

Hazards Addressed: Drought

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Californian has increasingly experienced droughts.

Project Description: Redesign campus landscaping to reduce watering needs.

Other Alternatives: Continue with current landscaping.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Landscaping Master Planning process.

Responsible Agency/ Department/Partners: Sierra College Facilities in conjunction with landscaping architects, other consultants, and landscaping firms.

Cost Estimate: TBD

Benefits (Losses Avoided): Potential loss in campus vegetation in case of prolonged drought. Also broader negative impacts to the environment and agricultural operations.

Potential Funding: Bond funds and other District funds

Timeline: 2021 to 2027

Project Priority (H, M, L): Medium

Action 4. Fuel Reduction

Hazards Addressed: Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Sierra College’s Rocklin and Tahoe-Truckee campuses both abut forested nature areas. There is potential for wild fires in these areas as a result of lightning strikes or human behaviors such as car accidents and smoking.

Project Description: Expand efforts to clear brush and deadwood in nature areas.

Other Alternatives: Do not expand fuel reduction efforts.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Review of fuel reduction needs and contract for necessary fuel reduction services including cutting and hauling deadwood, brush removal, and mowing.

Responsible Agency/ Department/Partners: Sierra College Facilities in conjunction with environmental consultants.

Cost Estimate: TBD

Benefits (Losses Avoided): Loss of life and property damage

Potential Funding: District funds

Timeline: ongoing

Project Priority (H, M, L): M

Action 5. Emergency Power Generation

Hazards Addressed: Temporary Loss of Electric Power

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Electricity outages affecting the campus occur from time to time due to grid failures and public safety power shutoff events.

Project Description: Review need for back-up power and assess feasibility of installing emergency generators. The District has installed a number of generators of the years, but continues to assess changing needs and threats through ongoing planning.

Other Alternatives: Do not install additional emergency generators.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Ongoing campus safety planning processes

Responsible Agency/ Department/Partners: Sierra College Facilities

Cost Estimate: Variable

Benefits (Losses Avoided): Disruption to campus operations, inconvenience and hardship for dorm residents, loss of food supplies in cafeteria kitchen, and loss of vaccine supplies and other sensitive supplies.

Potential Funding: Bond funds and other District funds

Timeline: 2021-2027

Project Priority (H, M, L): M

Annex V South Placer Fire Protection District

V.1 Introduction

This Annex details the hazard mitigation planning elements specific to South Placer Fire Protection District (South Placer FPD), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. Note, this South Placer FPD absorbed the Loomis Fire Protection District also a participating jurisdiction to the 2016 LHMP Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to South Placer FPD, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

V.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table V-1. Additional details on plan participation and District representatives are included in Appendix A.

Table V-1 South Placer FPD – Planning Team

Name	Position/Title	How Participated
Jeff Ingolia	Division Chief	Attended meetings. Provided input on hazard identification and hazards affecting the District. Provided capability tables and mitigation actions. Provided maps and logos.
Karl Fowler	Chief	Provided input on hazard identification and hazards affecting the District.
Matt Feeley	Deputy Chief	Provided input on hazard identification and hazards affecting the District.

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the District integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the District incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table V-2.

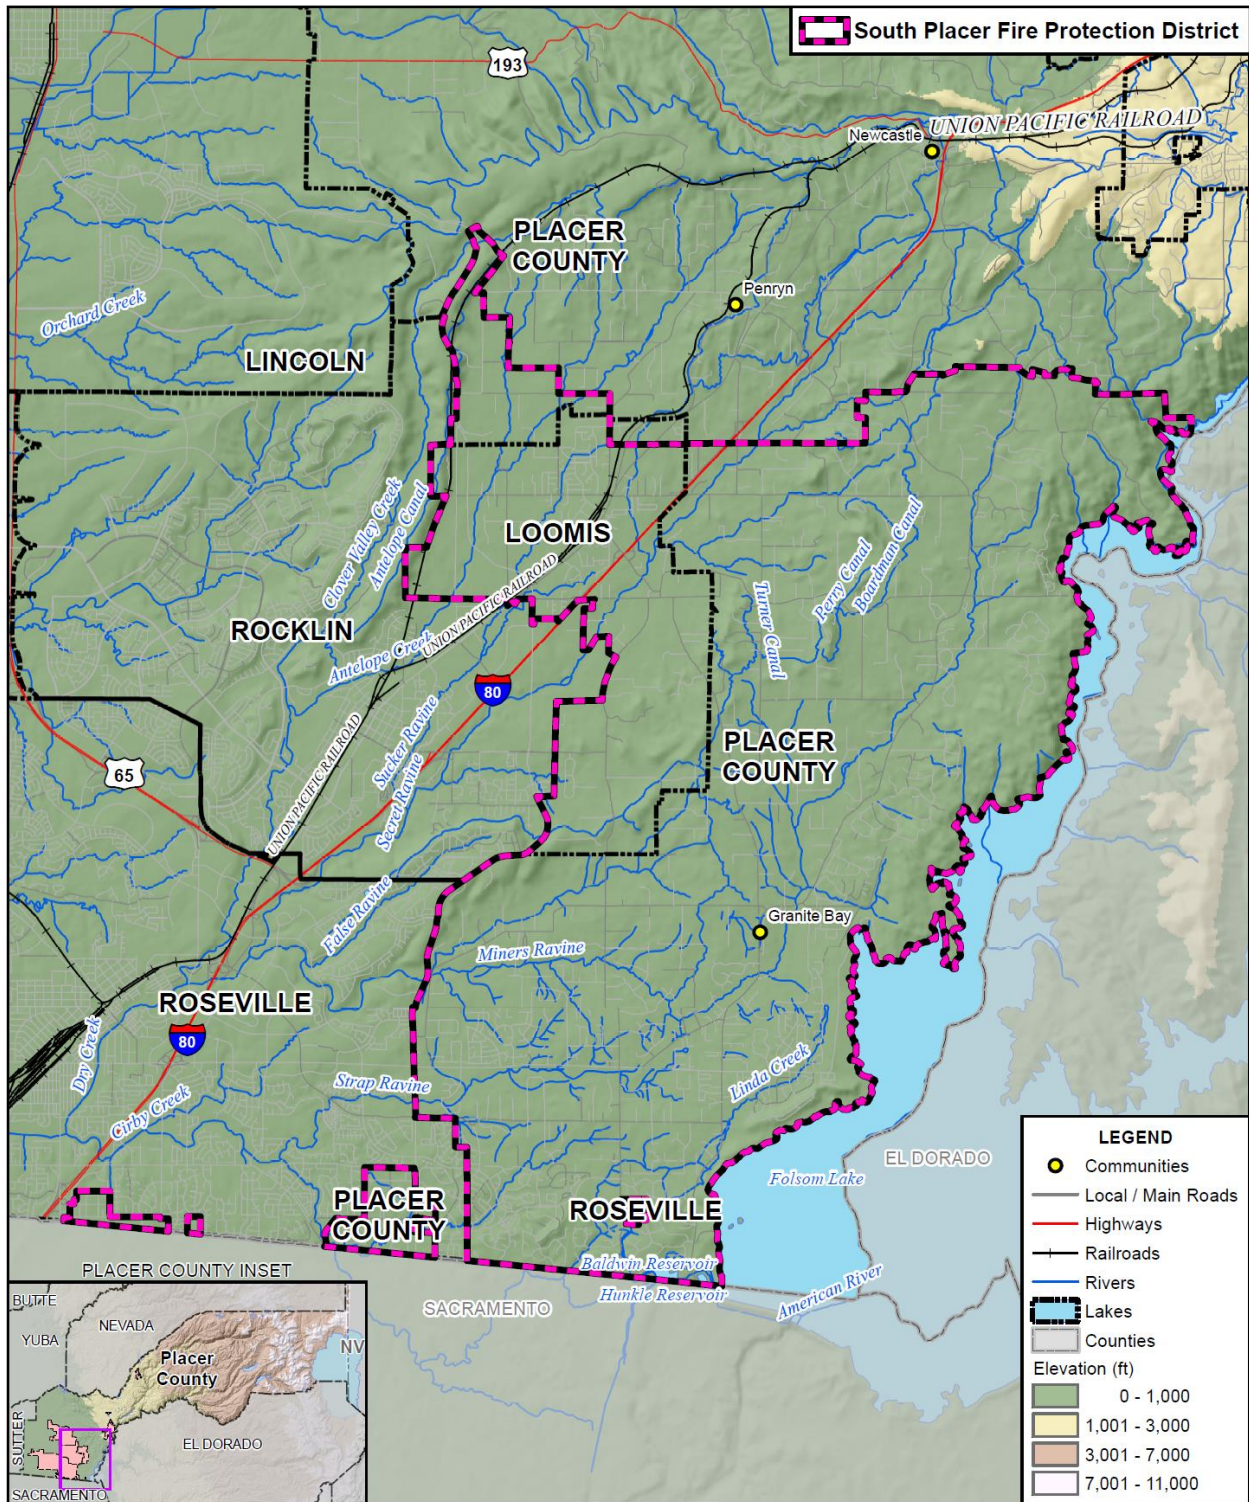

Table V-2 2016 LHMP Incorporation

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
N/A	No planning mechanisms related to the LHMP occurred since 2016.

V.3 District Profile

The District profile for the South Placer FPD is detailed in the following sections. Figure V-1 displays a map and the location of the District within Placer County.

Figure V-1 South Placer FPD

FOSTER MORRISON
CONSULTING

0 2 4 Miles

COUNTY OF
Placer

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

V.3.1. Overview and Background

South Placer FPD was formed on January 10, 1952. The principal act that governs the District is the Fire Protection District Law of 1987. This Act empowers fire districts to provide fire protection, rescue, emergency medical, hazardous material response, ambulance, and any other services relating to the protection of lives and property.

South Placer FPD is located entirely within Placer County and encompasses about 55 square miles. The District serves approximately 36 square miles of unincorporated Placer County (including the communities of Granite Bay and portions of Loomis, Penryn and Newcastle), and the Town of Loomis.

The District's boundary area consists of four non-contiguous parts. Three smaller areas are surrounded by the City of Roseville from three sides; in the south they are bordered by Sacramento County. The largest non-contiguous South Placer FPD portion to the east completely surrounds a small island of the City of Roseville and is bordered by the cities of Roseville and Rocklin in the west, Loomis, Penryn and Newcastle FPDs in the north, and Folsom Lake in the east.

V.4 Hazard Identification

South Placer FPD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table V-3).

Table V-3 South Placer FPD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Limited	Unlikely	Negligible	Low	Medium
Avalanche	Limited	Unlikely	Negligible	Low	Medium
Climate Change	Extensive	Likely	Limited	Medium	–
Dam Failure	Limited	Unlikely	Negligible	Low	Medium
Drought & Water Shortage	Significant	Likely	Limited	Medium	High
Earthquake	Extensive	Unlikely	Critical	Medium	Low
Floods: 1%/0.2% annual chance	Limited	Occasional	Limited	Medium	Medium
Floods: Localized Stormwater	Significant	Likely	Limited	Medium	Medium
Landslides, Mudslides, and Debris Flows	Limited	Unlikely	Negligible	Low	Medium
Levee Failure	Significant	Unlikely	Limited	Medium	Medium
Pandemic	Limited	Occasional	Critical	Low	Medium
Seiche	Limited	Unlikely	Negligible	Low	Medium
Severe Weather: Extreme Heat	Extensive	Highly Likely	Limited	Medium	High
Severe Weather: Freeze and Snow	Extensive	Likely	Limited	Medium	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Likely	Limited	Medium	Medium
Severe Weather: High Winds and Tornadoes	Extensive	Likely	Limited	Medium	Low
Tree Mortality	Significant	Likely	Limited	Low	High
Wildfire	Extensive	Highly Likely	Critical	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

V.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District's hazards and assess the District's vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

V.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section V.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table V-3) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

V.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District's total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the South Placer FPD's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table V-4 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. South Placer FPD’s physical assets, valued at over \$9.5 million, consist of the buildings and infrastructure to support the District’s operations.

Table V-4 South Placer FPD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
Station #15	Fire Facility	\$819,967.00	None
Station #16	Fire Facility	\$2,828,000.00	None
Administration (Portables)	Fire Facility	\$89,305.00	Levee Failure
Station #17	Fire Facility	\$2,361,700.00	Levee Failure
Station #17 Training Cargo Container	Fire Facility	\$2,862.00	Levee Failure
Shop	Fire Facility	\$305,259.00	Levee Failure
Station #19	Fire Facility	\$2,513,462.00	None
Station #20	Fire Facility	\$650,319.00	Wildfire
Total		\$9,570,874.00	

Source: South Placer FPD

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. SPFPD provides services to home and property owners, the elderly housed in commercial and residentially based care facilities, students, livestock owners, travelers, commercial business owners including offices, restaurants, bars, assembly, and mercantile occupancies.

Natural Resources

South Placer FPD has a variety of natural resources of value to the District. These natural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Historic and Cultural Resources

South Placer FPD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan.

There are approximately 29,973 residents within the District. The population density is 545 people per square mile. The District reported that it generally experienced moderate population growth over the last five years although in the last year South Placer FPD observed an increase in building starts and plan submittals. Population growth thus is trending toward significant. No formal population projections, however, have been done by the District. South Placer FPD estimates its future service needs through Placer County General Plan, Granite Bay Community Plan and Placer County Municipal Advisory Councils (MACs) planning meetings. The District also looks at the available lots for residential and commercial construction and plans for future construction.

The population of the District is anticipated to be 34,330 at full build-out of this rapidly developing area. The area is evenly divided between suburban and wildland areas, and mostly comprised of large-scale estates and ranch properties with many subdivisions, including wildland interface subdivisions and medium-scale retail shopping areas. The current average home is 6,710 square feet, with several homes over 18,000 square feet. Commercial building growth has been slower than residential growth.

South Placer FPD reports that growth has been concentrating in the southern area of the District. There are large parcels of land located near Station 16 (which is currently closed) that will be developed in the very near future. Approximately seven new subdivisions near Fire Stations 15,16 and 17, consisting of approximately 600 new homes will be developed and built within the next two to three years. Apart from the southern part of South Placer FPD, there are mainly lot splits and small parcels of land that will be developed on a regular basis until build out.

The Fire District anticipates accelerated population growth over the next 10 years. Service demand is expected to increase especially in the area of medical aids, with unknowns of weather conditions (drought, etc.) affecting the service demand. The continued use of the closest resource agreement and understaffing of local agencies may also impact the District's service demand.

Based on a review of the Granite Bay Community Plan and the Horseshoe Bar Community Plan, as well as through site survey of the properties in the District, District staff estimate that an additional 1800 residential units will be constructed in the District over the next 10 to 15 years. South Placer FPD also anticipates construction of an additional 980,000 square feet of commercial, office, and industrial building space during this time. In total, the District estimates that approximately 8.5 million square feet of building construction will occur in the District over the next 10 to 15 years. Fire Station 16 is currently unstaffed but is expected to house a full time Paramedic Unit this year (currently this resource resides at Station 17) and Engine Company in the next 2 years. Fire Station 18 is currently in the plan review stage for the construction of a new apparatus bay and station expansion and modernization which is anticipated to begin construction this year and be completed in 2022. There are currently no plans or proposals to increase the size of the Fire District.

Development since 2016

No District facilities have been constructed since 2016. Several Fire Stations within the District have been remodeled and updated within that time frame but there has been no new construction. As such, a change in vulnerability is unlikely.

Future Development

The District has no direct control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. As mentioned previously Fire Station 18 is currently in the plan review stage for a new apparatus bay and station expansion and modernization. Aside from this project there are no other construction activities planned for District facilities. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

V.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table V-3 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Climate Change

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Climate change adaptation is a key priority of the State of California. The 2018 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state’s infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing. Dry conditions continue to increase the risk of a sever wildfire event within the District as vegetation dries out sooner, catches fire more easily and spreads more rapidly. Heat related injuries have also been on the rise as both residents and visitors to our community experience more heat related health issues in both residential and recreational areas within the District.

Location and Extent

Climate change is a global phenomenon. It is expected to affect the whole of the District, Placer County, and State of California. There is no scale to measure the extent of climate change. Climate change exacerbates other hazards, such as drought, extreme heat, flooding, wildfire, and others. The speed of onset of climate change is very slow. The duration of climate change is not yet known, but is feared to be tens to hundreds of years.

Past Occurrences

Climate change has never been directly linked to any declared disasters. While the District noted that climate change is of concern, no specific impacts of climate change could be recalled. The District and HMPC members did, however, note that in Placer County, the strength of storms does seem to be increasing and the temperatures seem to be getting hotter. Hotter temperatures, combined with recent drought conditions, exacerbates the potential for damaging wildfires.

Vulnerability to and Impacts from Climate Change

The California Adaptation Planning Guide (APG) prepared by California OES and CNRA was developed to provide guidance and support for local governments and regional collaboratives to address the unavoidable consequences of climate change. California’s APG: Understanding Regional Characteristics has divided California into 11 different regions based on political boundaries, projected climate impacts, existing environmental setting, socioeconomic factors and regional designations. Placer County falls within the North Sierra Region characterized as a sparsely settled mountainous region where the region’s economy is primarily tourism-based. The region is rich in natural resources, biodiversity, and is the source for the

majority of water used by the state. This information can be used to guide climate adaptation planning in the District and Placer County Planning Area.

The California APG: Understanding Regional Characteristics identified the following impacts specific to the North Sierra region in which the Placer County Planning Area is part of:

- Temperature increases
- Decreased precipitation
- Reduced snowpack
- Reduced tourism
- Ecosystem change
- Sensitive species stress
- Increased wildfire

The District noted that there is a greater number of calls for heat related health issues as well as larger and more dangerous wildfires

Assets at Risk

The District noted that its facilities will most likely not be at risk from climate change.

Drought & Water Shortage

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area’s usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought

➤ D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table V-5.

Table V-5 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

Drought would most definitely affect the crop productions and pre-dry the lighter fuels creating more volatile wildfire conditions in the non-developed open areas of the District.

Assets at Risk

No District assets (from Table V-4) are at direct risk from this hazard.

Earthquake

Likelihood of Future Occurrence–Unlikely

Vulnerability–Medium

Hazard Profile and Problem Description

An earthquake is caused by a sudden slip on a fault. Stresses in the earth’s outer layer push the sides of the fault together. Stress builds up, and the rocks slip suddenly, releasing energy in waves that travel through the earth’s crust and cause the shaking that is felt during an earthquake. Earthquakes can cause structural damage, injury, and loss of life, as well as damage to infrastructure networks, such as water, power, gas, communication, and transportation. Earthquakes may also cause collateral emergencies including dam and levee failures, seiches, hazmat incidents, fires, avalanches, and landslides. The degree of damage depends on many interrelated factors. Among these are: the magnitude, focal depth, distance from the causative fault, source mechanism, duration of shaking, high rock accelerations, type of surface deposits or bedrock, degree of consolidation of surface deposits, presence of high groundwater, topography, and the design, type, and quality of building construction.

Location and Extent

The amount of energy released during an earthquake is usually expressed as a magnitude and is measured directly from the earthquake as recorded on seismographs. An earthquake’s magnitude is expressed in whole numbers and decimals (e.g., 6.8). Seismologists have developed several magnitude scales, as discussed in Section 4.3.11 of the Base Plan. Placer County itself is traversed by a series of northwest-trending faults, called the Foothill Fault Zone, that are related to the Sierra Nevada uplift. This was the source of Oroville’s 1975 earthquake (and an earlier event in the 1940s). Subsequent research of these events led to the identification and naming of the zone and questions about the siting and design of the proposed Auburn Dam. Earthquakes on nearby fault segments in the zone could be the source of ground shaking in the Placer County Planning Area.

Although portions of western and eastern Placer County are located in a seismically active region, no known faults actually go through any of the cities or towns. However, the Bear Mountain and the Melones faults are situated approximately three to four miles west and east of the City of Auburn respectively. Earthquakes on these two faults would have the greatest potential for damaging buildings in Auburn, especially the unreinforced masonry structures in the older part of the city and homes built before 1960 without adequate anchorage of framing and foundations. Similar lower magnitude but nearby earthquakes are capable of producing comparable damages in other Placer County communities.

Another measure of earthquake severity is intensity. Intensity is an expression of the amount of shaking at any given location on the ground surface. Seismic shaking is typically the greatest cause of losses to structures during earthquakes. Seismic shaking maps for the area show Placer County and the District fall within a low to moderate shake risk.

Past Occurrences

There have been no past federal or state disaster declarations from this hazard. The District noted no past occurrences of earthquakes or that affected the District in any meaningful way.

Vulnerability to and Impacts from Earthquake

The combination of plate tectonics and associated California coastal mountain range building geology generates earthquake as a result of the periodic release of tectonic stresses. Placer County lies in the center of the North American and Pacific tectonic plate activity. There have been earthquakes as a result of this activity in the historic past, and there will continue to be earthquakes in the future of the California north coastal mountain region.

Fault ruptures itself contributes very little to damage unless the structure or system element crosses the active fault; however, liquefaction can occur further from the source of the earthquake. In general, newer construction is more earthquake resistant than older construction due to enforcement of improved building codes. Manufactured buildings can be very susceptible to damage because their foundation systems are rarely braced for earthquake motions. Locally generated earthquake motions and associated liquefaction, even from very moderate events, tend to be more damaging to smaller buildings, especially those constructed of unreinforced masonry (URM) and soft story buildings. There are no URM or soft story buildings in the District.

The Uniform Building Code (UBC) identifies four seismic zones in the United States. The zones are numbered one through four, with Zone 4 representing the highest level of seismic hazard. The UBC establishes more stringent construction standards for areas within Zones 3 and 4. All of California lies within either Zone 3 or Zone 4. The SPFPD is within the less hazardous Zone 3.

Impacts from earthquake in the District will vary depending on the fault that the earthquake occurs on, the depth of the earthquake strike, and the intensity of shaking. Large events could cause damages to infrastructure, critical facilities, residential and commercial properties, and possible injuries or loss of life.

Small bridges located within residential neighborhoods would be at risk from an earthquake. If a bridge were to become damaged it could prohibit or significantly delay our response to a call for service. Damage to individual gas and water lines in both residential and commercial structures during an earthquake could result in localized flooding or a fire if an ignition source is nearby. Lastly, earthquake damage to the Levee located along Auburn Folsom Rd. could result in local flooding and/or damage to the roadway which could prohibit travel north and south along the eastern edge of the District.

Assets at Risk

Station 17 could be at risk from Earthquake damage if the levee adjacent to Auburn Folsom Rd. failed. Flooding from a break could impact this Station with damage to our network, communications, and computer systems which are currently located within this structure. Fire Stations are built with increased structural support and reinforcement as mandated by Building and Fire Codes in California to begin with, so no identifiable retrofitting is required on any of our facilities.

Flood: 1%/0.2% Annual Chance

Likelihood of Future Occurrence—Occasional

Vulnerability—Medium

Hazard Profile and Problem Description

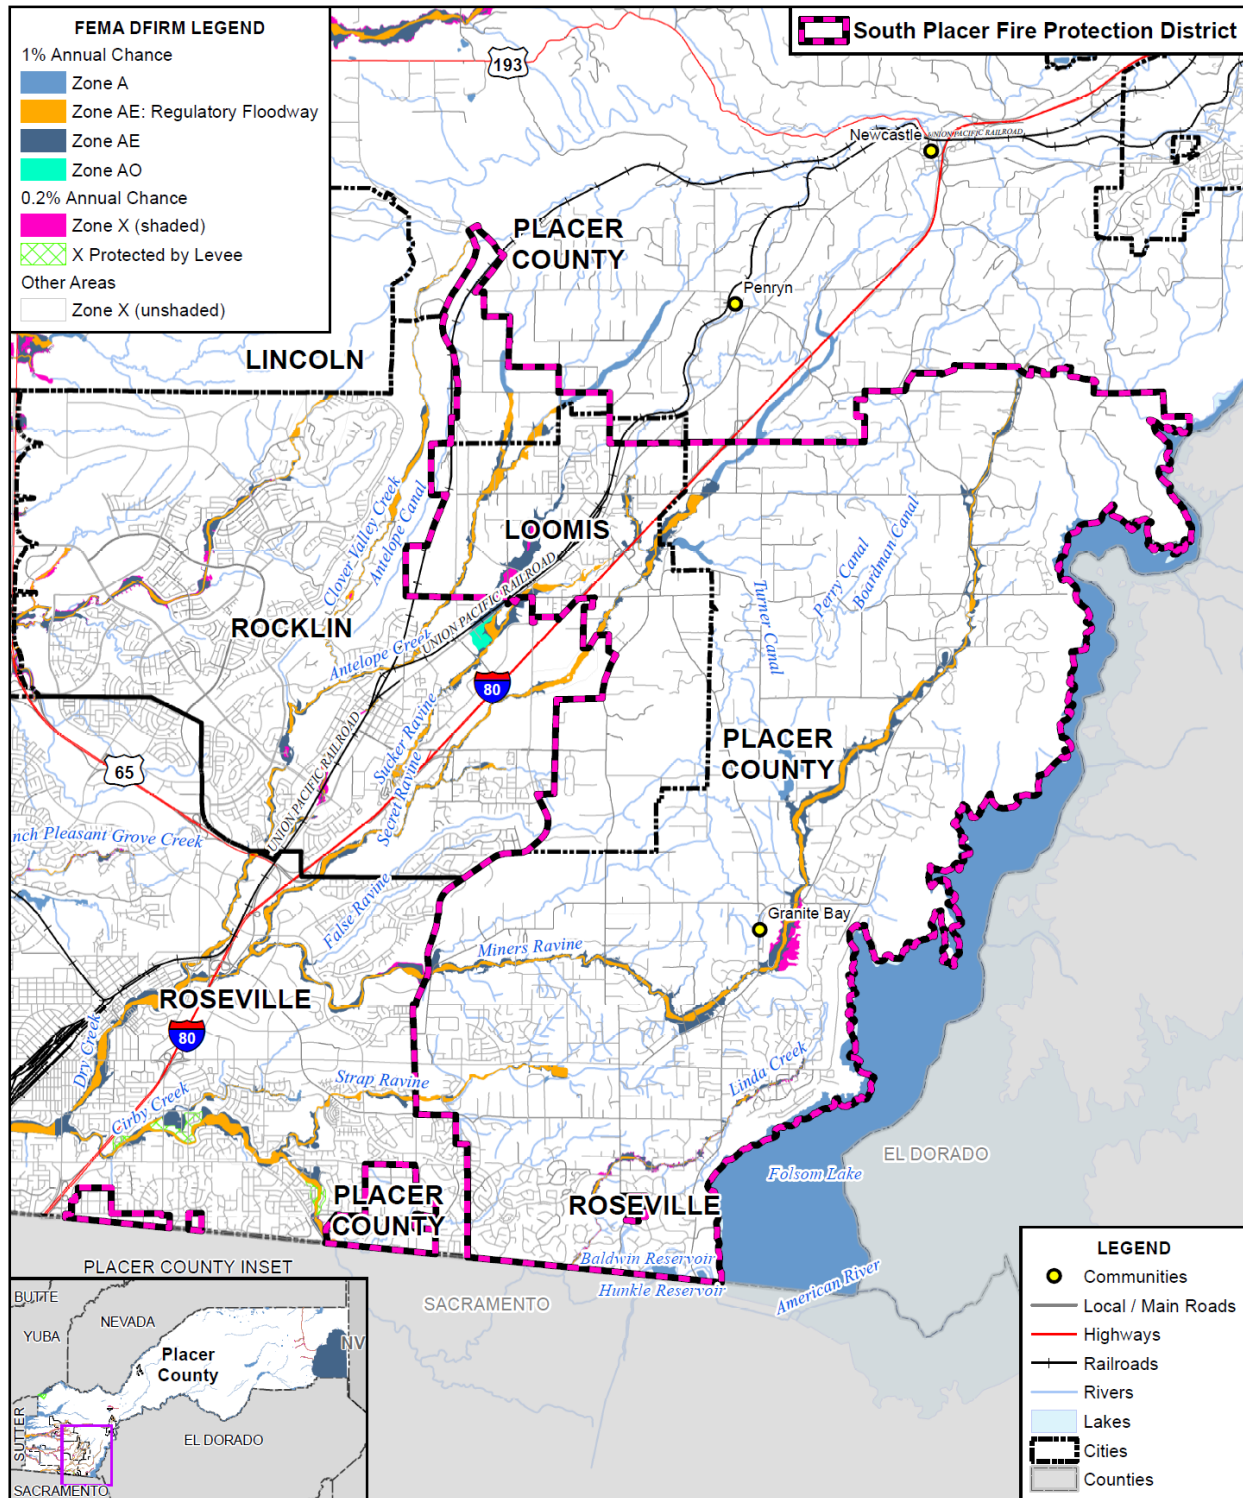

This hazard analyzes the FEMA DFIRM 1% and 0.2% annual chance floods. These tend to be the larger floods that can occur in the County or in the District, and have caused damages in the past. Flooding is a significant problem in Placer County and the District. Historically, the District has been at risk to flooding primarily during the winter and spring months when river systems in the County swell with heavy rainfall and snowmelt runoff. Normally, storm floodwaters are kept within defined limits by a variety of storm drainage and flood control measures. Occasionally, extended heavy rains result in floodwaters that exceed normal high-water boundaries and cause damage.

As previously described in Section 4.3.12 of the Base Plan, the Placer County Planning Area and the South Placer FPD have been subject to historical flooding.

Location and Extent

The South Placer FPD has areas located in the 1% and 0.2% annual chance floodplain. This is seen in Figure V-2.

Figure V-2 South Placer FPD – FEMA DFIRM Flood Zones

FOSTER MORRISON
CONSULTING

0 2 4 Miles

COUNTY OF
Placer

Data Source: FEMA DFIRM 11/2/2018, Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Table V-6 details the DFIRM mapped flood zones within the 1% annual chance flood zone as well as other flood zones located within the District.

Table V-6 South Placer FPD– DFIRM Flood Hazard Zones

Flood Zone	Description	Flood Zone Present in the District
A	1% annual chance flooding: No base flood elevations provided	X
AE	1% annual chance flooding: Base flood elevations provided	X
AE Floodway	1% annual chance flood: Regulatory floodway; Base flood elevations provided	X
AO	1% annual chance flooding: sheet flow areas. BFEs derived from detailed hydraulic analyses are shown in this zone.	X
Shaded X	0.2% annual chance flooding: The areas between the limits of the 1% annual chance flood and the 0.2-percent-annual-chance (or 500-year) flood	X
X Protected by Levee	Areas protected by levees from 1% annual chance flood event. Levee protection places these areas in the 0.2% annual chance flood zone.	
X (unshaded)	No flood hazard	X

Source: FEMA

Additionally, flood extents can generally be measured in volume, velocity, and depths of flooding. Expected flood depths in the District vary, depending on the nature and extent of a flood event; specific depths are unknown. Flood durations in the District tend to be short to medium term, or until either the storm drainage system can catch up or flood waters move downstream. Flooding in the District tends to have a shorter speed of onset, due to the amount of water that flows through the District.

Past Occurrences

A list of state and federal disaster declarations for Placer County from flooding is shown on Table V-7. These events also likely affected the District to some degree.

Table V-7 Placer County – State and Federal Disaster Declarations from Flood 1950-2020

Disaster Type	Federal Declarations		State Declarations	
	Count	Years	Count	Years
Flood (including heavy rains and storms)	16	1950, 1955, 1958 (twice), 1962, 1963, 1969, 1973, 1980, 1983, 1986, 1995 (twice), 1997, 2008, 2017	13	1955, 1958, 1962, 1964, 1969, 1983, 1986, 1995 (twice), 1997, 2006 (twice), 2017

Source: Cal OES, FEMA

Vulnerability to and Impacts from Flood

Floods have been a part of the District’s historical past and will continue to be so in the future. During winter months, long periods of precipitation and the timing of that precipitation are critical in determining

the threat of flood, and these characteristics further dictate the potential for widespread structural and property damages. Predominantly, the effects of flooding are generally confined to areas near the waterways of the County. As waterways grow in size from local drainages, so grows the threat of flood and dimensions of the threat. This threatens structures in the floodplain. Structures can also be damaged from trees falling as a result of water-saturated soils. Electrical power outages happen, and the interruption of power causes major problems. Loss of power is usually a precursor to closure of governmental offices and community businesses. Roads can be damaged and closed, causing safety and evacuation issues. People may be swept away in floodwaters, causing injuries or deaths.

Floods are among the costliest natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits. Direct impacts, such as drowning, can be limited with adequate warning and public education about what to do during floods. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, loss of environmental resources, and economic impacts.

The District is concerned with damage to commercial and residential properties from flooded creeks and ravines. This also may cause reduced crop production in the District.

Assets at Risk

No District assets (from Table V-4) are at direct risk from this hazard.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Flooding occurs in areas other than the FEMA mapped 1% and 0.2% annual chance floodplains. Flooding may be from drainages not studied by FEMA, lack of or inadequate drainage infrastructure, or inadequate maintenance. Localized, stormwater flooding occurs throughout the County during the rainy season from November through April. Prolonged heavy rainfall contributes to a large volume of runoff resulting in high peak flows of moderate duration.

Location and Extent

The South Placer FPD is subject to localized flooding throughout the District. Flood extents are usually measured in areas affected, velocity of flooding, and depths of flooding. Expected flood depths in the District vary by location. Flood durations in the District tend to be short to medium term, or until either the

storm drainage system can catch up or flood waters move downstream. Localized flooding in the District tends to have a shorter speed of onset, especially when antecedent rainfall has soaked the ground and reduced its capacity to absorb additional moisture.

The District tracks localized flooding areas. There are many localized flooding areas in the District. The localized flood areas identified by the South Placer FPD are summarized in Table V-8.

Table V-8 South Placer FPD – List of Localized Flooding Problem Areas

Area Name	Flooding	Pavement Deterioration	Washout	High Water	Landslide/ Mudslide	Debris	Downed Trees
Auburn Folsom	X						X
Joe Rodgers							X
Barton	X						
Itchy Acres	X						X
Cavitt Stallman	X						

Source: South Placer FPD

Past Occurrences

There have been no federal or state disaster declarations in the County due to localized flooding. The District noted the following past occurrences of localized flooding:

- Auburn Folsom Road is occasionally affected by overflowing streams and ravines as well as clogged storm drains which slowed travel and increased the likelihood of vehicle accidents. Some trees have fallen in this area and restricted travel but caused minimal damage to residences within this area.
- Joe Rodgers Rd was previously a problem area but improvements to the drainage in and around this area has made it less of a severe impact to the District. Some trees have fallen in this area and restricted travel but caused minimal damage to residences within this area.
- Barton Rd. is occasionally affected by overflowing streams and ravines as well as clogged storm drains which slowed travel and increased the likelihood of vehicle accidents.
- Itchy Acres is occasionally affected by overflowing streams and ravines as well as clogged storm drains which slowed travel and increased the likelihood of vehicle accidents. Some trees have fallen in this area and restricted travel but caused minimal damage to residences within this area.
- Cavitt Stallman Rd. is occasionally affected by overflowing streams and ravines as well as clogged storm drains which slowed travel and increased the likelihood of vehicle accidents.

Improvements have been made to drainage as well as the flow of streams and ravines within the District over the last few years and as a result we saw less adverse conditions from localized flooding during the heavy winter storms of 2017, 2019, and 2021. However, the District does still continue to experience a moderate number of downed trees which occasionally impede travel or under the most extreme conditions cause fires in vegetation or residential occupancies when they come in contact with overhead power lines.

Vulnerability to and Impacts from Localized Flooding

Historically, much of the growth in the District and County has occurred adjacent to streams, resulting in significant damages to property, and losses from disruption of community activities when the streams

overflow. Additional development in the watersheds of these streams affects both the frequency and duration of damaging floods through an increase in stormwater runoff.

Primary concerns associated with stormwater flooding include life safety issues, and impacts to property and to infrastructure that provides a means of ingress and egress throughout the community. Ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Objects can also be buried or destroyed through sediment deposition. Floodwaters can break utility lines and interrupt services. Standing water can cause damage to crops, roads, and foundations. Other problems connected with flooding and stormwater runoff include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

Assets at Risk

No District assets (from Table V-4) are at direct risk from this hazard.

Levee Failure

Likelihood of Future Occurrence–Unlikely

Vulnerability–Medium

Hazard Profile and Problem Description

A levee is a raised area that runs along the banks of a stream or canal. Levees reinforce the banks and help prevent flooding by containing higher flow events to the main stream channel. By confining the flow to a narrower stream channel, levees can also increase the speed of the water. Levees can be natural or man-made.

Levees provide strong flood protection, but they are not failsafe. Levees are designed to protect against a specific flood level and could be overtopped during severe weather events or dam failure. For example, levees can be certified to provide protection against the 1% annual chance flood. Levees reduce, not eliminate, the risk to individuals and structures located behind them. A levee system failure or overtopping can create severe flooding and high water velocities. Levee failure can occur through overtopping or from seepage issues resulting from burrowing rodents, general erosion, excessive vegetation and root systems and other factors that compromise the integrity of the levee. No levee provides protection from events for which it was not designed, and proper operation and maintenance are necessary to reduce the probability of failure.

Location and Extent

There is not a scientific scale or measurement system in place for levee failure. Expected flood depths from a levee failure in the District vary by event and location. The speed of onset is slow as the river rises, but if a levee fails the warning times are generally short for those in the inundation area. The duration of levee failure risk times can be hours to weeks, depending on the river flows that the levee holds back. When northern California dams and reservoirs are nearing maximum capacity, they release water through the river systems, causing additional burdens on County levees. Levees in the District were shown on Figure V-2.

The South Placer Fire District is bordered by a large levee that parallels Auburn Folsom Rd between Eureka Rd. and Beals Point. This levee was created to contain and form this portion of Folsom Lake.

Past Occurrences

There have been no federal or state disaster declarations from levee failure. The District Planning Team noted no past occurrences of levee failures.

Vulnerability to and Impacts from Levee Failure

A levee failure can range from a small, uncontrolled release to a catastrophic failure. Levee failure flooding can occur as the result of prolonged rainfall and flooding. The primary danger associated with levee failure is the high velocity flooding of those properties outside and downstream of the breach.

Should a levee fail, some or all of the area protected by the levees would be at risk to flooding. Impacts from a levee failure include property damage, critical facility damage, and life safety issues. Business and economic losses could be large as facilities could be flooded and services interrupted. School and road closures could occur. Road closures would impede both evacuation routes and ability of first responders to quickly respond to calls for aid. Other problems connected with levee failure flooding include erosion, sedimentation, degradation of water quality, losses of environmental resources, and certain health hazards.

Levee failure risk in the District is the same as the flood vulnerability however Station 17 could experience significant issues if the levee along Auburn Folsom Rd. failed. Flooding could damage the Fire Station as well as the apparatus housed within this Station including a Fire Truck, Engine, Rescue Unit, and Brush Unit. In addition, Station 17 is the hub for our computer network and could affect outlying Fire Stations ability to access computer programs and/or phone lines that are utilized on a regular basis for departments activities such as staffing and run reports. Fire Inspection and Investigation records could be damaged or lost as well. If damage occurred to the mechanics shop it could affect the Districts ability to repair its fleet and it would have to outsource that service which could significantly delay repair times.

Assets at Risk

The areas at greatest risk from a levee failure would be Fire Station 17, the Administration Portables at Station 17 as well as the mechanics shop at this location

Severe Weather: Extreme Heat

Likelihood of Future Occurrence–Highly Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to FEMA, extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. Heat kills by taxing the human body beyond its abilities. In extreme heat and high humidity, evaporation is slowed, and the body must work extra hard to maintain a normal temperature.” Most heat disorders occur because the victim has been

overexposed to heat or has over-exercised for his or her age and physical condition. Older adults, young children, and those who are sick or overweight are more likely to succumb to extreme heat.

In addition to the risks faced by citizens of the District, there are risk to the built environment from extreme heat. While extreme heat on its own does not usually affect structure, extreme heat during times of drought can cause wildfire risk to heighten. Extreme heat and high winds can cause power outages and PSPS events, causing issues to buildings in the District.

Extreme Heat and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power outages can be found in Section 4.3.2 of the Base Plan.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, including periods of high winds, high temperatures, and low humidity, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Location and Extent

Heat is a regional phenomenon and affects the whole of the District. Heat emergencies are often slower to develop, taking several days of continuous, oppressive heat before a significant or quantifiable impact is seen. Heat waves do not strike victims immediately, but rather their cumulative effects slowly affect vulnerable populations and communities. Heat waves do not generally cause damage or elicit the immediate response of floods, fires, earthquakes, or other more "typical" disaster scenarios.

The NWS has in place a system to initiate alert procedures (advisories or warnings) when extreme heat is expected to have a significant impact on public safety. The expected severity of the heat determines whether advisories or warnings are issued. The NWS HeatRisk forecast provides a quick view of heat risk potential over the upcoming seven days. The heat risk is portrayed in a numeric (0-4) and color

(green/yellow/orange/red/magenta) scale which is similar in approach to the Air Quality Index (AQI) or the UV Index. This can be seen in Section 4.3.2 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for heat. The District Planning Team noted that since extreme heat is a regional phenomenon, events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.2.

PSP events have negatively impacted and affected Fire Station 20 which experienced several power shutdowns in 2019. In 2020 the District installed an Emergency Backup Generator at this location and the effects are now nonexistent. Increased calls for service due to heat related health issues have increased slightly as does the District's emergency response occurrences to Folsom Lake as the number of visitors increases during extended periods of high daytime temperatures.

Vulnerability to and Impacts from Extreme Heat

The District experiences temperatures in excess of 100°F during the summer and fall months. The temperature moves to 105-110°F in rather extreme situations. During these times, drought conditions may worsen. Also, power outages and PSPS events may occur during these times as well, especially when combined with the potential for severe wind events. Health impacts, including loss of life, are often the primary concern with this hazard, though economic impacts can also be an issue.

Days of extreme heat have been known to result in medical emergencies, and unpredictable human behavior. Periods of extended heat and dryness (droughts) can have major economic, agricultural, and water resources impacts. Extreme heat can also dry out vegetations, making it more vulnerable to wildfire ignitions.

High temperatures create volatile light flashy fuels, creating a severe fire hazard throughout the entire District, especially in the WUI. Reduced crop production would result as well.

Assets at Risk

All Fire Stations and Fire District Employees are at risk and can be negatively impacted by extreme heat in our area.

Severe Weather: Freeze and Snow

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

According to the NWS and the WRCC, winter snowstorms can include heavy snow, ice, and blizzard conditions. Heavy snow can immobilize a region, stranding commuters, stopping the flow of supplies, and disrupting emergency and medical services. Accumulations of snow can collapse roofs and knock down

trees and power lines. In rural areas, homes and farms may be isolated for days, and unprotected livestock may be lost. The cost of snow removal, damage repair, and business losses can have a tremendous impact on cities and towns.

Heavy accumulations of ice can bring down trees, electrical wires, telephone poles and lines, and communication towers. Communications and power can be disrupted for days until the damage can be repaired. Power outages can have a significant impact on communities, especially critical facilities such as public utilities. Even small accumulations of ice may cause extreme hazards to motorists and pedestrians.

Some winter storms are accompanied by strong winds, creating blizzard conditions with blinding wind-driven snow, severe drifting, and dangerous wind chills. Strong winds accompanying these intense storms and cold fronts can knock down trees, utility poles, and power lines. Blowing snow can reduce visibility to only a few feet in areas where there are no trees or buildings. Serious vehicle accidents with injuries and deaths can result. Freezing temperatures can cause significant damage to the agricultural industry.

Location and Extent

Freeze and snow are regional issues, meaning the entire District is at risk to cold weather and freeze events. While there is no scale (i.e. Richter, Enhanced Fujita) to measure the effects of freeze, the WRCC reports that in a typical year, minimum temperatures fall below 32°F on 22.6 days with 0 days falling below 0°F in western Placer County. Snowfall is measured in depths, and the WRCC reports that average snowfall on the western side of the County is 1.4 inches. Freeze and snow have a slow onset and can generally be predicted in advance for the County. Freeze events can last for hours (in a cold overnight), or for days to weeks at a time. Snow event can last for hours or days, but is more unlikely in the western portion of the County. When it does snow, the snow often melts relatively quickly.

Past Occurrences

There has been no federal and one state disaster declarations in the County for freeze and snow, as shown on Table V-9.

Table V-9 Placer County – State and Federal Disaster Declarations from Freeze and Snow 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Freeze	1	1972	0	–

Source: Cal OES, FEMA

The District noted that cold and freeze is a regional phenomenon; events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.3.

The District has had minimal impacts due to cold and freeze events in our area. The most common experience is water pipes that burst and generate calls for service to assist home and business owners. There typically is no snow at our District’s elevation so it is not an issue in our area.

Vulnerability to and Impacts from Severe Weather: Freeze and Snow

The District experiences temperatures below 32 degrees during the winter months. Freeze can cause injury or loss of life to residents of the District. While it is rare for buildings to be affected directly by freeze, damages to pipes that feed building can be damaged during periods of extreme cold. Freeze and snow can occasionally be accompanied by high winds, which can cause downed trees and power lines, power outages, accidents, and road closures. Transportation networks, communications, and utilities infrastructure are the most vulnerable physical assets to impacts of severe winter weather in the County. During extreme winter events, response times to emergencies may be extended.

The District has concerns with reduced crop production, in addition to infrastructure damage due to frozen pipes.

Assets at Risk

All Fire Stations within the District are at risk for broken pipes however the constant occupation of our buildings during the day and night significantly reduces that probability.

Severe Weather: Heavy Rains and Storms (Hail, Lightning)

Likelihood of Future Occurrence–Likely

Vulnerability–Medium

Hazard Profile and Problem Description

Storms in the District occur annually and are generally characterized by heavy rain often accompanied by strong winds and sometimes lightning and hail. Approximately 10 percent of the thunderstorms that occur each year in the United States are classified as severe. A thunderstorm is classified as severe when it contains one or more of the following phenomena: hail that is three-quarters of an inch or greater, winds in excess of 50 knots (57.5 mph), or a tornado. Heavy precipitation in the District falls mainly in the fall, winter, and spring months.

Location and Extent

Heavy rain events occur on a regional basis. Rains and storms can occur in any location of the District. All portions of the District are at risk to heavy rains. Most of the severe rains occur during the fall, winter, and spring months. There is no scale by which heavy rains and severe storms are measured. Magnitude of storms is measured often in rainfall and damages. The speed of onset of heavy rains can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of severe storms in California, Placer County, and the District can range from minutes to hours to days. Information on precipitation extremes can be found in Section 4.3.4 of the Base Plan.

Past Occurrences

There have been past disaster declarations from heavy rains and storms, which were discussed in Past Occurrences of the flood section above. According to historical hazard data, severe weather, including

heavy rains and storms, is an annual occurrence in the District. This is the cause of many of the federal disaster declarations related to flooding. Though there have been no significant events in the District in the past five years, the impact of severe storms is felt by the need to upstaff our crews as well as a significant increase in call volume for weather related emergencies including but not limited to vehicle accidents, down trees, localized flooding, and damage to homes.

Vulnerability to and Impacts from Heavy Rain and Storms

Heavy rain and severe storms are the most frequent type of severe weather occurrences in the District. These events can cause localized flooding. Elongated events, or events that occur during times where the ground is already saturated can cause 1% and 0.2% annual chance flooding. Wind often accompanies these storms and has caused damage in the past. Hail and lightning are rare in the District.

Actual damage associated with the effects of severe weather include impacts to property, critical facilities (such as utilities), and life safety. Heavy rains and storms often result in localized flooding creating significant issues. Roads can become impassable and ground saturation can result in instability, collapse, or other damage to trees, structures, roadways and other critical infrastructure. Floodwaters and downed trees can break utilities and interrupt services.

During periods of heavy rains and storms, power outages can occur. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

All District Fire Stations are susceptible to damage from severe storms. District apparatus can be impacted by physical damage to the unit while responding to and from an emergency, a catastrophic event at one of our Fire Stations due to the weather or blocked and/or flooded roadway. Impacts to the District are the costs incurred with damage to a Station or one of our Apparatus as well as delayed response times to an emergency if a unit or station is out of service.

Assets at Risk

All Fire Stations and Apparatus within the District are at risk from this hazard.

Severe Weather: High Winds and Tornadoes

Likelihood of Future Occurrence—Likely

Vulnerability—Medium

Hazard Profile and Problem Description

High winds, as defined by the NWS glossary, are sustained wind speeds of 40 mph or greater lasting for 1 hour or longer, or winds of 58 mph or greater for any duration. High winds can cause significant property and crop damage, threaten public safety, and have adverse economic impacts from business closures and power loss. High winds are a primary factor in PSPS events.

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes form when cool, dry air sits on top of warm, moist air. Tornadoes are the most powerful storms that exist. Tornadoes, though rare, are another severe weather hazard that can affect areas of the Placer County Planning Area, primarily during the rainy season in the late fall, winter, and early spring.

Location and Extent

The entire District is subject to significant, non-tornadic (straight-line), winds. Each area of the County is at risk to high winds. Magnitude of winds is measured often in speed and damages. These events are often part of a heavy rain and storm event, but can occur outside of storms. The speed of onset of winds can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of winds in California is often short, ranging from minutes to hours. The Beaufort scale is an empirical 12 category scale that relates wind speed to observed conditions at sea or on land. Its full name is the Beaufort Wind Force Scale. The Beaufort Scale was shown in Section 4.3.5 of the Base Plan.

Portions of the County are also located in a special wind hazard region, which is a result of foehn winds. A foehn wind is a type of dry down-slope wind that occurs in the lee (downwind side) of a mountain range. Winds of this type are called "snow-eaters" for their ability to make snow melt or sublimate rapidly. This snow-removing ability is caused not only by warmer temperatures, but also the low relative humidity of the air mass coming over the mountain(s). They are also associated with the rapid spread of wildfires, making some regions which experience these winds particularly fire prone.

Tornadoes, while rare, can occur at any location in the County and District. Prior to February 1, 2007, tornado intensity was measured by the Fujita (F) scale. This scale was revised and is now the Enhanced Fujita scale. Both scales are sets of wind estimates (not measurements) based on damage. The new scale (EF) provides more damage indicators (28) and associated degrees of damage, allowing for more detailed analysis and better correlation between damage and wind speed. It is also more precise because it considers the materials affected and the construction of structures damaged by a tornado. The F Scale and EF Scale are shown in Section 4.3.5 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for winds and tornadoes. The District noted that since high winds is a regional phenomenon, events that affected the lower elevations of the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.5.

In the District, high winds can cause issues for residents and District personnel. The HMPC provided past occurrences of wind events for the District. Downed power lines, caused by wind events, occurred 143 times between 1985 and 2015. 28 other severe weather events occurred inside District boundaries.

The District experienced a significant storm event on January 28th, 2021. This storm brought very high winds to the area and numerous trees fell causing a series of emergencies. Several trees fell against power lines causing small spot fires however one of these incidents did cause a power surge which subsequently caused a structure fire at a residence. In addition, one of our Fire Engines got stuck in soft ground as it attempted to maneuver around fallen trees across a driveway as it responded to an emergency. Once stuck,

the Engine blocked other Fire Engines and equipment and hose lines had to be hand carried to the home to address the emergency. No injuries or damage to our apparatus were reported but the blocked driveway did cause a significant delay in our response.

Vulnerability to and Impacts from Severe Weather: Wind and Tornado

High winds are common occurrences in the District throughout the entire year. Straight line winds are primarily a public safety and economic concern. Windstorm can cause damage to structures and power lines which in turn can create hazardous conditions for people. Debris flying from high wind events can shatter windows in structures and vehicles and can harm people that are not adequately sheltered. High winds can impact critical facilities and infrastructure and can lead to power outages. Wind can also drive wildfire flames, spreading wildfires quickly, During periods of high winds and dry vegetation, wildfire risk increases. High winds that occur during periods of extreme heat can cause PSPS events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Impacts from high winds in the District will vary. Future losses from straight line winds include:

- Downed trees
- Power line impacts and economic losses from power outages
- Increased PSPS events
- Occasional building damage, primarily to roofs

All Fire Stations within the District are vulnerable to high wind damage which can cause falling trees into our buildings or across our driveways. All Fire Apparatus are vulnerable to high wind damage also in the form of falling trees while in quarters or when responding to an emergency. Damage to a Station or Apparatus can result in that unit being out of service which can delay emergency response times in that area as units from a neighboring Fire Station or jurisdiction would have to be utilized to respond to the emergency.

Assets at Risk

All Fire Stations and Apparatus are at risk from high winds in the form of fallen trees in, on or around our facilities and equipment.

Wildfire

Likelihood of Future Occurrence—Highly Likely

Vulnerability—High

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the South Placer FPD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for

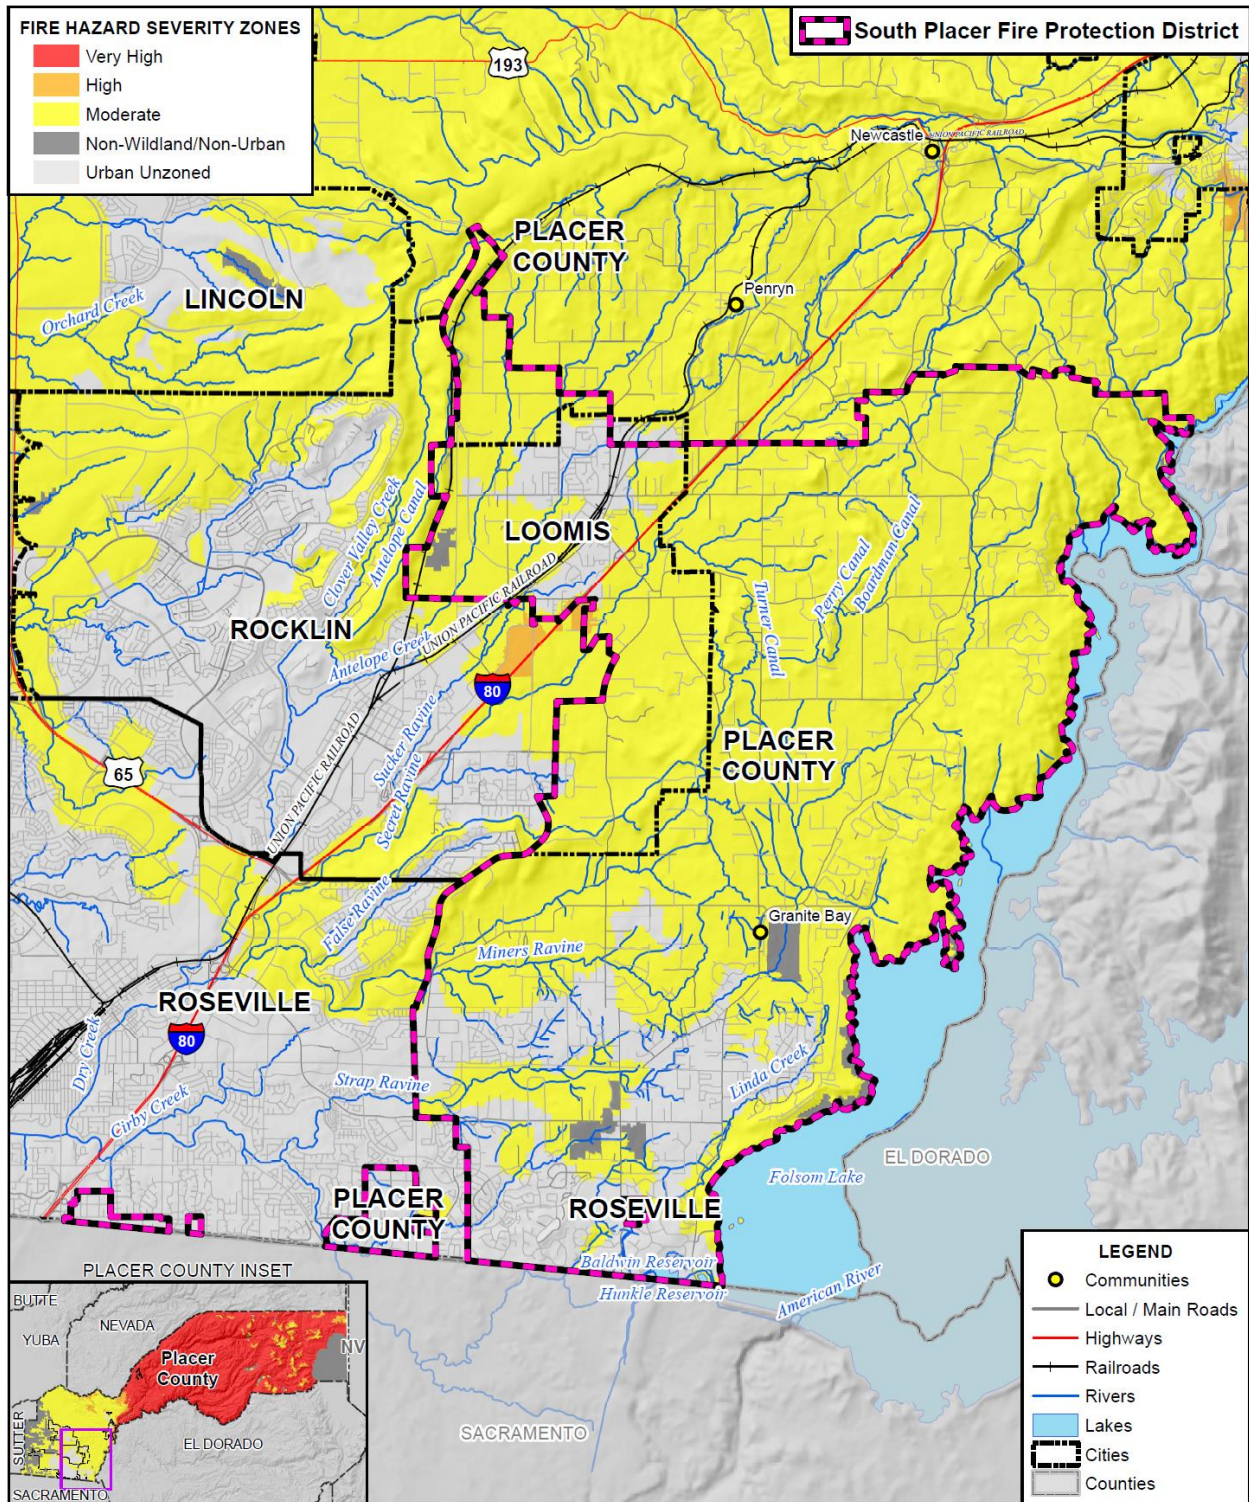

human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the South Placer FPD were created. Figure V-3 shows the CAL FIRE FHSZ in the District. As shown on the maps, the fire hazard severity zone within the District falls into the Moderate range.

The California Department of Forestry and Fire Protection (Cal Fire) provides services throughout the State. Generally, Cal Fire services are focused in wildland areas defined as state responsibility areas (SRA). Similarly, the United States Forest Service (USFS) also provides services in California, primarily within forests and grasslands. Areas where USFS services are focused are defined as federal responsibility areas (FRA). The territory of the District that lies within the Town of Loomis is designated as local responsibility area (LRA) and is not considered by Cal Fire to be a very high fire hazard severity zone. Unincorporated areas in the east and northwestern tip of the District are classified as SRA and considered to be moderate fire hazard severity zones. Cal Fire also provides technical support throughout the County in the form of specialized services such as fire suppression hand crews, dozers, and helicopter services when necessary.

Figure V-3 South Placer FPD – Fire Hazard Severity Zones

FOSTER MORRISON
CONSULTING

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

COUNTY OF
Placer

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table V-10.

Table V-10 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

The South Placer Fire Protection District provided past occurrences of fire that the District has responded to from 1985 to 2015. There were 1,485 fires that caused \$48,375,358 in total losses. Many of these fires were house, car, or building fires. However, 601 of these fires were in grass, brush, forest, or natural vegetation fires. Damages from these specific fires was unavailable.

There have been no significant fires of this type in our jurisdiction over the last 5 years. To date our largest fire has been approximately 5 acres... most are 1 acre or less.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

The District boundaries contain agricultural land. From time to time, fire threatens agricultural areas. According to data provided by the HMPC, there have been four incidents in the District where fire has threatened cultivated vegetation or trees. Damages from these fires was unavailable.

Assets at Risk

Station 20 is at direct risk from this hazard.

V.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

V.6.1. Regulatory Mitigation Capabilities

Table V-11 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the South Placer FPD.

Table V-11 South Placer FPD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	N	Not Applicable to this Fire District
Capital Improvements Plan	Y	The District conducts capital improvement planning through multiple plans, including the apparatus replacement plan, capital facilities plan, long-term facility maintenance plan, and major equipment plan. The purpose of all capital improvements is the reduction of fire risk in the borders of the South Placer FPD.
Economic Development Plan	N	Not applicable to this Fire District

Local Emergency Operations Plan	N	Partnership with the Town of Loomis to address local hazards, identify projects and implement mitigation strategies. This plan is a guide, and any mitigation actions are identified at the time it is adopted.
Continuity of Operations Plan	N	Not applicable this Fire District
Transportation Plan	N	Not applicable this Fire District
Stormwater Management Plan/Program	N	Not applicable this Fire District
Engineering Studies for Streams	N	Not applicable this Fire District
Community Wildfire Protection Plan	Y	Currently done through Firewise Communities and Fire Safe Councils for individual neighborhoods within the District. These programs identify hazards and are used to create and implement mitigation measures.
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	Not applicable this Fire District
Building Code, Permitting, and Inspections		
	Y/N	Are codes adequately enforced?
Building Code	Y	Version/Year: 2019 CBC and 2013 CFC
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score: 1-3
Fire department ISO rating:	Y	Rating: 3/3Y
Site plan review requirements	Y	Board adopted standards.
Is the ordinance an effective measure for reducing hazard impacts?		
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	Y	Reduces hazard impacts by regulating where homes can be built. The ordinance is adequately administered and enforced.
Subdivision ordinance	Y	Reduces hazard impacts by regulating subdivision access and water supplies ensuring our District needs are met so we can respond to and effectively mitigate an emergency.
Floodplain ordinance	N	Not applicable this Fire District
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	Not applicable this Fire District
Flood insurance rate maps	N	Not applicable this Fire District
Elevation Certificates	N	Not applicable this Fire District
Acquisition of land for open space and public recreation uses	N	Not applicable this Fire District
Erosion or sediment control program	N	Not applicable this Fire District
Other	N	Not applicable this Fire District
How can these capabilities be expanded and improved to reduce risk?		
Creation of a Natural Hazard specific section within our local ordinance could help our agency identify and reduce the possible negative impacts associated with homes being built in high-risk wildfire areas. This can assist the District by reducing the number of homes in these areas as well as improving our ability to respond effectively to an emergency within a specific natural hazard zone.		

Source: South Placer FPD

The District signed a MOU with Placer County for the Hazardous Vegetation Abatement Ordinance to help mitigate the hazardous vegetation within our District.

V.6.2. Administrative/Technical Mitigation Capabilities

Table V-12 identifies the District department(s) responsible for activities related to mitigation and loss prevention in South Placer FPD. The five-member board of directors governs the District. Board members are elected by the general population residing within the district boundaries and serve for staggered four-year terms.

Table V-12 South Placer FPD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	Y	Work with the Granite Bay MAC, Placer County and the Town of Loomis to regulate and promote safe community developments. Coordination is effective between all agencies involved.
Mitigation Planning Committee	N	Not applicable this Fire District
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	N	Not applicable this Fire District
Mutual aid agreements	Y	Assistance from allied agencies that border our District is extremely helpful and effective. Our ability to assist neighboring agencies when the need arises is also very effective.
Other	N	
Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?		
Staff	Y/N FT/PT	
Chief Building Official	N	Not applicable this Fire District
Floodplain Administrator	N	Not applicable this Fire District
Emergency Manager	N	Not applicable this Fire District
Community Planner	N	Not applicable this Fire District
Civil Engineer	N	Not applicable this Fire District
GIS Coordinator	N	Not applicable this Fire District
Other	N	
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	N	Not applicable this Fire District
Hazard data and information	N	Not applicable this Fire District
Grant writing	Y	Effective in the past but could be improved. All grants for the District are written and applied for by a private 3 rd party whom we pay to assist us with the application process.
Hazus analysis	N	Not applicable this Fire District
Other	N	

How can these capabilities be expanded and improved to reduce risk?

Since we are a Fire District most of the services listed above are adequately and effectively provided by the County. Our District has an excellent working relationship with the County and will continue to work hard to address concerns and work collaboratively on behalf of our citizens. Grant writing could be improved by our District by applying for more grants to obtain the funds to create, improve or enhance our ability to respond to emergencies within our protection area.

Source: South Placer FPD

The District reported that its actual response capability at an incident consisted of three engines, a truck, ambulance, a battalion chief, and all 14 personnel on duty at any given time. There is also an additional capability of Volunteer and or Intern Firefighters that respond off duty on a regular basis.

V.6.3. Fiscal Mitigation Capabilities

Table V-13 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table V-13 South Placer FPD’s Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	N	Not applicable this Fire District
Authority to levy taxes for specific purposes	Y	Fire District have levied special fire taxes on their communities to help fund staffing, equipment or facility needs. This method has been considered but not implement within our Fire District yet.
Fees for water, sewer, gas, or electric services	N	Not applicable this Fire District
Impact fees for new development	Y	Zone of benefit assessments to commercial occupancies that can generate high call volumes. This has been used in the past and continues to be used within the District to generate revenue for the operations side of our Fire District.
Storm water utility fee	N	Not applicable this Fire District
Incur debt through general obligation bonds and/or special tax bonds	N	Not applicable this Fire District
Incur debt through private activities	N	Not applicable this Fire District
Community Development Block Grant	N	Not applicable this Fire District
Other federal funding programs	Y	This has been used in the form or grants and could be used again in the future to fund mitigation efforts or increase staffing to effectively deal with mitigation activities.

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
State funding programs	Y	This has been used in the form of grants and could be used again in the future to fund mitigation efforts or increase staffing to effectively deal with mitigation activities
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
Special Taxes, Zone of Influence fees, as well as Federal and Local grants are all tools to create funding for our Fire District which directly benefits acquisition of personnel, purchases of updated apparatus, and improvement to facilities all of which enhance our ability to respond to emergencies within our district in a safe, and competent manner while providing the highest level of service to those in need.		

Source: South Placer FPD

In FY 12-13, the District received \$8,084,253 in revenue, including 66 percent from property taxes, eight percent from special tax, 14 percent from ambulance service charges, two percent from mitigation fees, three percent from OES reimbursements, one percent from cellular tower lease, four percent from proceeds from capital lease, and one percent from other sources. Interest income and fees also constituted a small percentage of the District's income (less than one percent).

The District is primarily funded by property tax, special tax and the District's ability to generate revenue by providing ambulance service and contracting for other services. Reportedly, the District's collection rate on ambulance services is about 42 percent.

Special tax was originally passed in 1980 and 1984 and is collected every year with no cost of living allowance at \$70 per residence or \$2 per acre of vacant land. The FY 21-22 tax role is anticipated at \$700,995.80 for 10,014 parcels. Special tax is collected by the County, which charges one percent of collected amount.

V.6.4. Mitigation Education, Outreach, and Partnerships

Table V-14 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table V-14 South Placer FPD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	Fire Safe Councils and Fire Wise Communities work on emergency preparedness and mitigation within their specific communities

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	Fire Prevention Trailer taken out to public events within the District. Fire Safety brochures are distributed to attendees.
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	Y	Partnership with Firewise communities to help them obtain their certification and ongoing efforts within those communities to help in emergency preparedness and mitigation efforts.
Public-private partnership initiatives addressing disaster-related issues	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
The District does not have the revenue to employ a Public Education specialist, so it relies heavily on help from within the Community. Fire Safe Councils and Fire Wise Communities play a critical role in keeping communities safe and the District need to assist as many neighborhoods as possible in obtaining these certifications. The benefit to the District is immeasurable but immensely important as the best outcome from an emergency comes from the emergency never happening.		

Source: South Placer FPD

V.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

South Placer FPD is a signatory of the Western Placer County Cooperative Fire Services Response Agreement along with the 12 other fire protection agencies in western Placer County, including Alta Fire Protection District, Cal Fire/Placer County Fire Department, Foresthill Fire Protection District, Newcastle Fire Protection District, Penryn Fire Protection District, Placer Hills Fire Protection District, City of Auburn Fire Department, City of Colfax Fire Department, City of Lincoln Fire Department, City of Rocklin Fire Department, and City of Roseville Fire Department. According to the agreement, the agencies provide automatic aid to each other and make use of the closest resource dispatching fire, rescue, and medical emergency response without regard to jurisdiction or statutory responsibility.

The District provides services to other communities in California under the California State Mutual Aid Plan. South Placer FPD also supports the statewide mutual aid system by staffing a State of California Office Of Emergency Services Engine. The District is a part of the Placer County strike team deployment plan. District administrators have served as local area coordinators, strike team leaders, strike team assistants participated on State organized management teams and have sent emergency equipment to incidents all over the State of California and surrounding states.

South Placer FPD has automatic aid agreements with Sacramento Metropolitan Fire Protection District, City of Rocklin, City of Roseville and City of Folsom Fire Departments.

The District has a good working relationship with American Medical Response (AMR), which is one of the ambulance service providers in Placer County. South Placer FPD has automatic and mutual aid agreements with AMR to provide ambulance in some of the AMR service areas within eight minutes of South Placer FPD travel time, while AMR provides backup as needed. South Placer FPD is a party to two ambulance automatic aid agreements, AMR and Penryn FPD. The District also signed a medical services mutual aid agreement with AMR and Newcastle FPD, according to which the closest provider responds to a request for medical transportation within a specific area in Newcastle FPD.

The District is a member of the California Fire Chiefs Association, Western Placer County Fire Chiefs Association, California State Firefighters Association, Fire Districts Association of California, and Fire Agencies Self Insurance System (FASIS). South Placer FPD participates in the Placer County Closest Resource Agreement, Placer County Emergency Operations Plan, and Region Four Mass Casualty Incident (MCI) Plan.

V.7 Mitigation Strategy

V.7.1. Mitigation Goals and Objectives

The South Placer FPD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

V.7.2. Mitigation Actions

The planning team for the South Placer FPD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Climate Change
- Drought & Water Shortage
- Earthquake
- Floods: 1%/0.2% annual chance
- Floods: Localized Stormwater
- Levee Failure
- Severe Weather: Extreme Heat
- Severe Weather: Freeze and Snow
- Severe Weather: Heavy Rains and Storms
- Severe Weather: High Winds and Tornadoes
- Wildfire

After review of possible mitigation actions, the following were dropped from priority for mitigation planning:

- Levee Failure
- Freeze and Snow

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Vegetation Management in Open Space Areas

Hazards Addressed: Climate Change, Drought and Water Shortage, Extreme Heat, High Winds and Tornadoes, Tree Mortality, Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The topography, climate (including extreme heat, drought and water shortage, and high winds and tornadoes), and vegetation throughout the South Placer Fire District is conducive to the spread of wildfires. High Risk areas contain extensive grasslands and oak woodlands in rolling terrain. Some of this vegetation is invasive species, which choke out native flora. In times of drought, it is the invasive species that tend to proliferate. These invasive species can also serve as ladder fuels during periods of wildfire.

Project Description: Partner with our neighbors at Placer County Code Enforcement to enforce State Law regarding defensible space to reduce the rapid spread of wildfire. Vegetation will be removed to protect grasslands and oak woodlands. This vegetation competes with trees and green plants.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Plan Review for new residences and subdivisions. Investigation of hazardous vegetation complaints. MOU w /Placer County for Hazardous Vegetation Abatement

Responsible Agency/Department/Partners: South Placer Fire District, Property Owners, Placer County Code Enforcement, CalFire

Cost Estimate: Unknown at this time.

Benefits (Losses Avoided): Reduce the risks associated with natural hazards in the area. Preservation of life and property.

Potential Funding: Grants

Timeline: Ongoing

Project Priority (H, M, L): High

Action 2. Shaded Fuel Break along west shore of Folsom Lake - Granite Bay

Hazards Addressed: Climate Change, Drought and Water Shortage, Earthquake, Flood Hazards, Levee Failure, Severe Weather Hazards, Tree Mortality, Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The topography, climate, and vegetation throughout the South Placer Fire District is conducive to the spread of wildfires. High Risk areas contain extensive grasslands and oak woodlands in rolling terrain. This area has not been maintained for many years.

Project Description: Partner with our neighbors at CalFire, State Parks, and the Bureau of Reclamation to create a shaded fuel break along the lake and help protect the home that back up to this area.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Granite Bay Shaded Fuel Break Project, MOU w /Placer County for Hazardous Vegetation Abatement.

Responsible Agency/Department/Partners: South Placer Fire District, BOR, State Parks, CalFire

Cost Estimate: To be determined

Benefits (Losses Avoided): Reduce the risks associated with natural hazards in the area. Preservation of life and property.

Potential Funding: Grants

Timeline: Ongoing

Project Priority (H, M, L): High

Action 3. Backup Generator Installation for Fire Stations

Hazards Addressed: Climate Change, Drought and Water Shortage, Earthquake, Flooding (both 1%/0.2% and localized) Extreme Heat, Heavy Rains and Storms, High Winds and Tornadoes, Tree Mortality, Wildfire

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: Natural disasters (those listed in the hazard addressed above) and PSPS can potentially affect the availability of electricity to South Placer Fire District Stations that do not have power backup capabilities. Communication (to and from) as well as critical networking infrastructure for the fire district can be affected by power outages. PSPS events occur during periods of hot dry weather. PSPS events also occur predominantly during high wind and drought conditions. It is during these times that the District is especially in need of backup power.

Project Description: Add Emergency Backup Generators to South Placer Fire District Stations 15,16 and 17.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Apply for grants to fund the addition of backup generators. Fundraising projects.

Responsible Agency/Department/Partners: South Placer Fire District, Placer County

Cost Estimate: \$50,000

Benefits (Losses Avoided): Ensures that communications and networking infrastructure is always available regardless of the status of the electric grid. Reduce the risks associated with natural hazards in the area. Preservation of life and property.

Potential Funding: Grants

Timeline: Ongoing

Project Priority (H, M, L): High

Annex W Tahoe City Public Utility District

W.1 Introduction

This Annex details the hazard mitigation planning elements specific to the Tahoe City Public Utility District (TCPUD or District), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to TCPUD, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

W.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table W-1. Additional details on plan participation and District representatives are included in Appendix A.

Table W-1 TCPUD – Planning Team

Name	Position/Title	How Participated
Tony Laliotis	Director of Utilities	Agency representative, meeting attendance, annex completion
Dan Lewis	Utilities Superintendent	Agency representative, meeting attendance, annex completion

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the District integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the District incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table W-2.

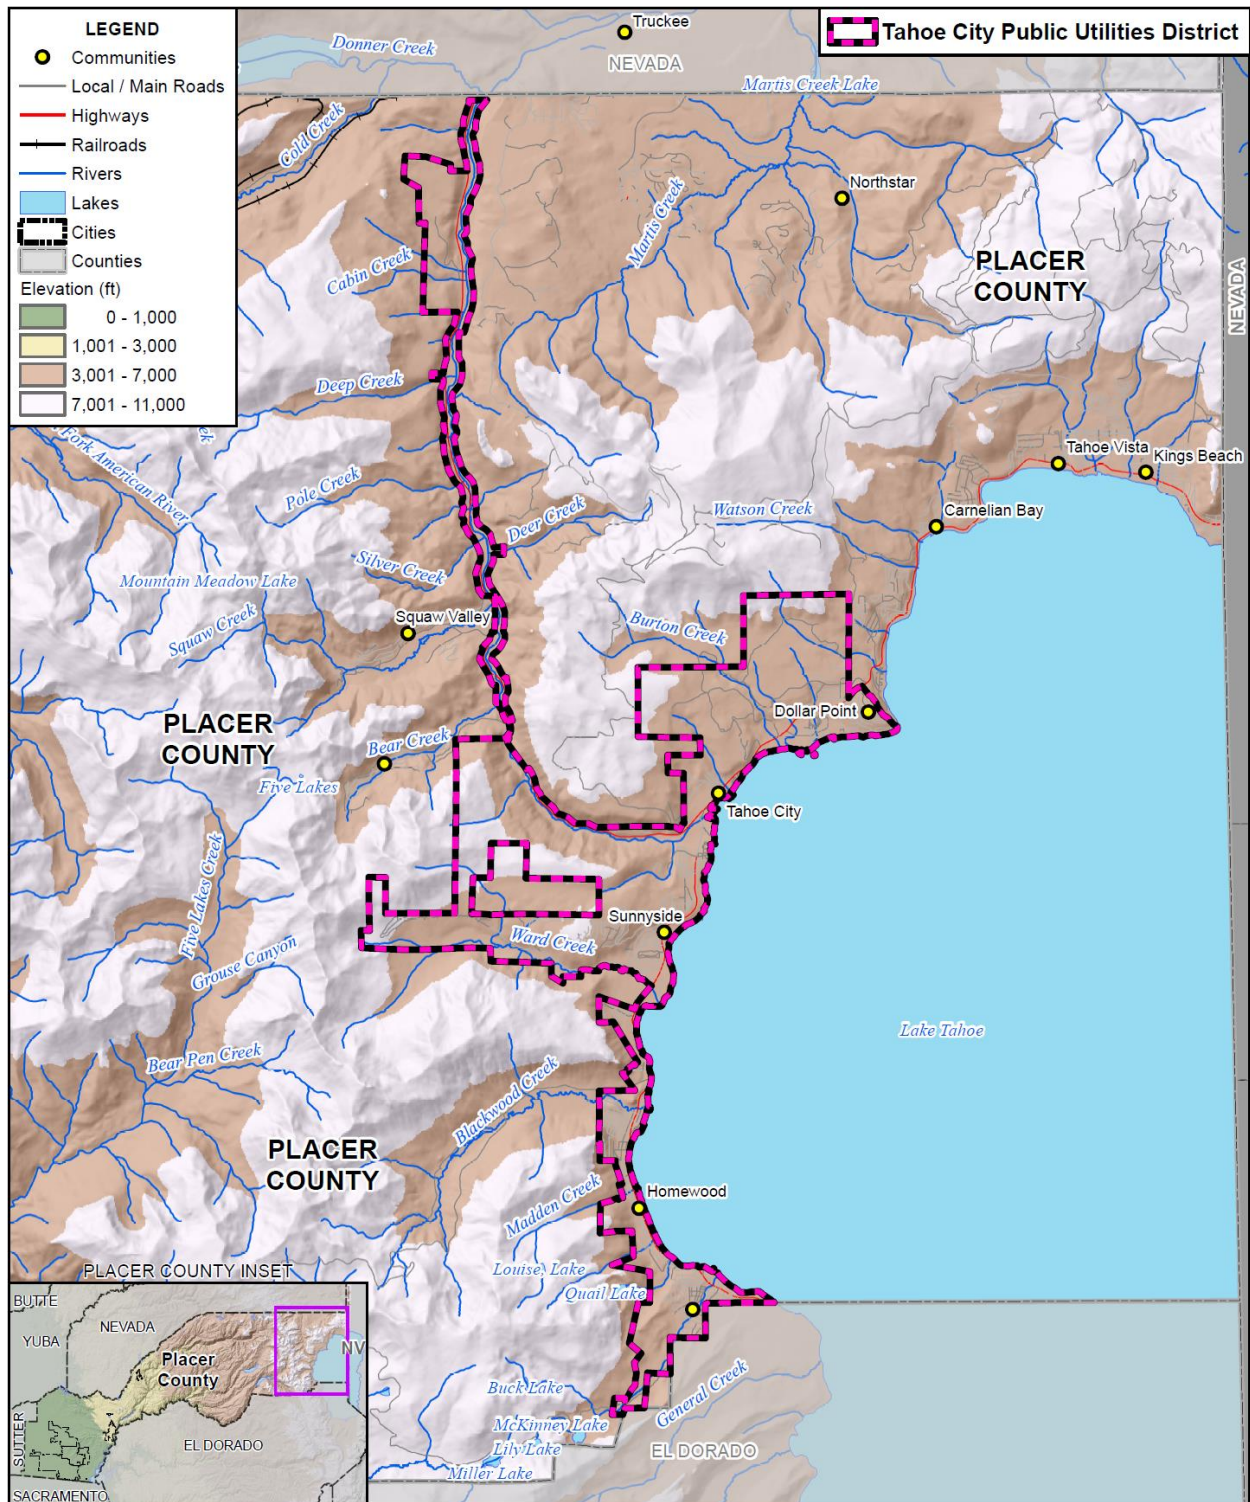

Table W-2 2016 LHMP Incorporation

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
N/A	No mitigation related planning mechanisms have been completed since 2016

W.3 District Profile

The District profile for the TCPUD is detailed in the following sections. Figure W-1 displays a map and the location of the District within Placer County.

Figure W-1 TCPUD

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

W.3.1. Overview and Background

The Tahoe City Public Utility District was founded in 1938 to provide some of the governmental needs of the residents of Tahoe City. It is the oldest local government in the Tahoe Basin and was formed initially to provide public water service to the local community. Established under the State of California's Public Utility District Act, the founders of the District chose a form of government that could provide multiple types of services. The boundaries of the District extend from Emerald Bay to Dollar Hill, and along the Truckee River to the Nevada County line. The service area is very large, encompassing almost 22 square miles.

The TCPUD's provides sewer collection, parks facilities, and recreation services for the entire area of the District. Water service is provided in four separate systems and serves approximately half of the homes and businesses in the District. Water service is provided to approximately 4,000 customers; sewer services to 7,800 customers; and parks and recreation customers total over 500,000.

The Tahoe City area is characterized by mild summers and cool, wet winters, with an average high temperature in July of 82 and 42 in January. Annual precipitation in the watershed varies from an average of 65 inches in the west to approximately 40 inches per year in the east. The majority of precipitation occurs as snowfall during the winter months. A relatively small amount of precipitation occurs as rain during the spring and summer months.

W.4 Hazard Identification

TCPUD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table W-3).

Table W-3 TCPUD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Limited	Unlikely	Negligible	Low	Medium
Avalanche	Limited	Likely	Critical	Low	Medium
Climate Change	Extensive	Likely	Limited	Low	–
Dam Failure	Limited	Unlikely	Critical	Low	Medium
Drought & Water Shortage	Significant	Likely	Critical	High	High
Earthquake	Significant	Occasional	Critical	Low	Low
Floods: 1%/0.2% annual chance	Significant	Occasional	Limited	Low	Medium
Floods: Localized Stormwater	Likely	Unlikely	Limited	Low	Medium
Landslides, Mudslides, and Debris Flows	Limited	Likely	Negligible	Low	Medium
Levee Failure	Limited	Unlikely	Limited	Low	Medium
Pandemic	Limited	Unlikely	Limited	Low	Medium
Seiche	Significant	Unlikely	Critical	Medium	Medium
Severe Weather: Extreme Heat	Limited	Likely	Limited	Low	High
Severe Weather: Freeze and Snow	Extensive	Highly Likely	Critical	Low	Medium
Severe Weather: Heavy Rains and Storms	Significant	Highly Likely	Critical	Low	Medium
Severe Weather: High Winds and Tornadoes	Significant	Highly Likely	Critical	High	Low
Tree Mortality	Significant	Highly Likely	Critical	High	High
Wildfire	Significant	Highly Likely	Critical	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

W.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District’s hazards and assess the District’s vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

W.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section W.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table W-3) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

W.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District’s total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the TCPUD’s assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table W-4 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. TCPUD’s physical assets, valued at over \$62 million, consist of the buildings and infrastructure to support the District’s operations.

Table W-4 TCPUD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Type	Replacement Value	Which Hazards Pose Risk
Fairway Community Center	Community Center	\$1,008,230	
Highland Community Center	Community Center	\$665,130

Source: TCPUD

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. TCPUD provides services to approximately 15,000 full time residents. Seasonal populations can increase to over 50,000 residents at times during peak summer months such as July.

Natural Resources

TCPUD has a variety of natural resources of value to the District. These natural resources parallel that of the Tahoe Area of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Historic and Cultural Resources

TCPUD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of the Tahoe Area of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

Due to specific development restrictions within the Lake Tahoe Basin, typical growth within the District boundaries is less than one half percent (0.5%) annually.

Development since 2016

No District facilities have been constructed since 2016. As such, a change in vulnerability is unlikely.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Tahoe Area of Placer County Planning Area. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

W.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table W-3 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.

- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Drought & Water Shortage

Likelihood of Future Occurrence—Likely

Vulnerability—High

Hazard Profile and Problem Description

Drought is a complex issue involving many factors—it occurs when a normal amount of precipitation and snow is not available to satisfy an area’s usual water-consuming activities. Drought can often be defined regionally based on its effects. Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for agriculture, manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Location and Extent

Drought and water shortage are regional phenomenon. The whole of the County, as well as the whole of the District, is at risk. The US Drought Monitor categorizes drought conditions with the following scale:

- None
- D0 – Abnormally dry
- D1 – Moderate Drought
- D2 – Severe Drought
- D3 – Extreme drought
- D4 – Exceptional drought

Drought has a slow speed of onset and a variable duration. Drought can last for a short period of time, which does not usually affect water shortages and for longer periods. Should a drought last for a long period of time, water shortage becomes a larger issue. Current drought conditions in the District and the County are shown in Section 4.3.10 of the Base Plan.

Past Occurrences

There has been one state and one federal disaster declaration due to drought since 1950. This can be seen in Table W-5.

Table W-5 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Drought	1	2014	1	1977

Source: Cal OES, FEMA

Since drought is a regional phenomenon, past occurrences of drought for the District are the same as those for the County and includes 5 multi-year droughts over an 85-year period. Details on past drought occurrences can be found in Section 4.3.10 of the Base Plan.

Vulnerability to and Impacts from Drought and Water Shortage

Based on historical information, the occurrence of drought in California, including the District, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts can be extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. Drought impacts are wide-reaching and may be economic, environmental, and/or societal. Tracking drought impacts can be difficult.

The most significant qualitative impacts associated with drought in the Placer County Planning Area are those related to water intensive activities such as agriculture, wildfire protection, municipal usage, commerce, tourism, recreation, and wildlife preservation. Mandatory conservation measures are typically implemented during extended droughts. Drought conditions can also cause soil to compact and not absorb water well, potentially making an area more susceptible to flooding. With a reduction in water, water supply issues based on water rights becomes more evident. Climate change may create additional impacts to drought and water shortage in the County and the District.

During periods of drought, vegetation can dry out which increases fire risk. Drought that occurs during periods of extreme heat and high winds can cause Public Safety Power Shutoff (PSPS) events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section below, as well as in Section 4.3.2 of the Base Plan.

The impact of a drought on the District is primarily one of water supply. All water provided by the TCPUD comes from deep groundwater wells located in various locations in the Lake Tahoe Basin. Continued drought can severely compromise the water supply within the district. Most recently, after multiple years of below-average rainfall and very low snow-melt run off, Governor Brown in signed emergency regulations into place in 2015 requiring all of California to reduce water use by 25%. TCPUD has adopted Ordinance 284, Water Conservation and Drought Response Standards since the last LHMP and has been actively working with customers to meet the State mandates.

Assets at Risk

All groundwater wells within the District.

Severe Weather: High Winds and Tornadoes

Likelihood of Future Occurrence–Likely

Vulnerability–High

Hazard Profile and Problem Description

High winds, as defined by the NWS glossary, are sustained wind speeds of 40 mph or greater lasting for 1 hour or longer, or winds of 58 mph or greater for any duration. High winds can cause significant property and crop damage, threaten public safety, and have adverse economic impacts from business closures and power loss. High winds can also cause PSPS events.

Tornadoes are rotating columns of air marked by a funnel-shaped downward extension of a cumulonimbus cloud whirling at destructive speeds of up to 300 mph, usually accompanying a thunderstorm. Tornadoes form when cool, dry air sits on top of warm, moist air. Tornadoes are the most powerful storms that exist. Tornadoes, though rare, are another severe weather hazard that can affect areas of the Placer County Planning Area, primarily during the rainy season in the late fall, winter, and early spring, primarily in the western part of the County.

Location and Extent

The entire District is subject to significant, non-tornadic (straight-line), winds. Each area of the County is at risk to high winds. Magnitude of winds is measured often in speed and damages. These events are often part of a heavy rain and storm event, but can occur outside of storms. The speed of onset of winds can be short, but accurate weather prediction mechanisms often let the public know of upcoming events. Duration of winds in California is often short, ranging from minutes to hours. The Beaufort scale is an empirical 12 category scale that relates wind speed to observed conditions at sea or on land. Its full name is the Beaufort Wind Force Scale. The Beaufort Scale was shown in Section 4.3.5 of the Base Plan.

Portions of the County are also located in a special wind hazard region, which is a result of foehn winds. A foehn wind is a type of dry down-slope wind that occurs in the lee (downwind side) of a mountain range. Winds of this type are called "snow-eaters" for their ability to make snow melt or sublimate rapidly. This snow-removing ability is caused not only by warmer temperatures, but also the low relative humidity of the air mass coming over the mountain(s). They are also associated with the rapid spread of wildfires, making some regions which experience these winds particularly fire prone.

Tornadoes, while rare, can occur at any location in the County and District, but would more likely occur in Western Placer. Prior to February 1, 2007, tornado intensity was measured by the Fujita (F) scale. This scale was revised and is now the Enhanced Fujita scale. Both scales are sets of wind estimates (not measurements) based on damage. The new scale (EF) provides more damage indicators (28) and associated degrees of damage, allowing for more detailed analysis and better correlation between damage and wind speed. It is also more precise because it considers the materials affected and the construction of structures damaged by a tornado. The F Scale and EF Scale are shown in Section 4.3.5 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for winds and tornadoes. The District noted that since high winds is a regional phenomenon, events that affected the upper elevations of the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.5.

Vulnerability to and Impacts from Severe Weather: Wind and Tornado

High winds are common occurrences in the District throughout the entire year. Straight line winds are primarily a public safety and economic concern. Windstorm can cause damage to structures and power lines which in turn can create hazardous conditions for people. Debris flying from high wind events can shatter windows in structures and vehicles and can harm people that are not adequately sheltered. High winds can impact critical facilities and infrastructure and can lead to power outages. Wind can also drive wildfire flames, spreading wildfires quickly. During periods of high winds and dry vegetation, wildfire risk increases. High winds that occur during periods of extreme heat can cause PSPS events to be declared in the County. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan.

Impacts from high winds in the District will vary. Future losses from straight line winds include:

- Downed trees
- Power line impacts and economic losses from power outages
- Increased PSPS events
- Occasional building damage, primarily to roofs

The District noted that it is the wildfires driven by the winds that will be of greatest impact to the District.

Assets at Risk

All District assets are at direct risk from high winds. Tornadoes are much less likely in the District.

Future Development

Any new development in the District will be built to current standards, which take high winds into account. Tornadoes are unlikely to affect future District facilities.

Tree Mortality

Likelihood of Future Occurrence—Highly Likely

Vulnerability—High

Hazard Profile and Problem Description

One of the many vulnerabilities of drought in Placer County is the increased risk of widespread tree mortality events that pose hazards to people, homes, and community infrastructure, create a regional economic burden to mitigate, and contribute to future fuel loads in forests surrounding communities. During extended drought, tree mortality is driven by a build-up in endemic bark beetle populations and

exacerbated by latent populations of a suite of native insects and disease. Non-native forest pests (insects and/or pathogens) can also contribute to tree mortality events.

Location and Extent

Onset of tree mortality events can be relatively fast; however conditions – such as high stand densities – that lead to tree mortality accumulate slowly over time. Duration of tree mortality is lengthy, as once the tree dies, it remains in place until removed by human activity, wildfire, or breakdown of the wood by nature. Many areas in Placer County have seen increases in tree mortality. The County has mapped these areas, and that map was shown in Section 4.3.18 of the Base Plan. Using a color legend, the map provided by CAL FIRE shows a scale of:

- Deep burgundy depicting areas with more than 40 dead trees per acre
- Red depicting 15 to 40 dead trees per acre
- Orange depicting 5 to 15 dead trees per acre
- Yellow depicting 5 or less dead trees per acre

In the past decade, mortality has increased in the eastern portion of Placer County. During the 2012-2018 drought, the state of California Tree Mortality Task force designated multiple Tier 1 and Tier 2 High Hazard Zones where tree mortality posed an elevated risk to human health, properties, and resource values. A number of Placer County areas were designated during this event and the majority of Placer County watersheds were designated as Tier 2 high hazard zones because of the significant levels of tree mortality, along with numerous Tier 1 High hazard “hot spots”. A map of these areas was shown in in Section 4.3.18 of the Base Plan.

Past Occurrences

There have been no state or federal disasters in the County related directly to tree mortality, though it has most likely contributed to the intensity of past wildfires in the County. Those events are shown in the Past Occurrences section of Wildfire below. In 2015, then-Governor Edmund G. Brown Jr. proclaimed a state of emergency due to the extreme hazard of the dead and dying trees. Following the proclamation, 10 counties were determined to be most affected, which included Placer County. Placer County proclaimed a local emergency due to tree mortality conditions on Dec. 8, 2015. No events of past tree mortality have affected the District. Though the District noted it was unclear if the Washoe Fire in 2007 was worsened by tree mortality.

Vulnerability to and Impacts from Tree Mortality

Placer County is unique in that many residential and business areas of the community are in the wildland urban interface/intermix with the forest. Trees in these interface/intermix areas are particularly vulnerable to insect and/or drought driven mortality because of the additional stressors that urban environments impose on trees (i.e. soil compaction, altered hydrology, physical damage, heat islands etc.). This exacerbates the occurrence of tree mortality within the populated settings of the County.

Dead trees are a hazard to the general public and forest visitors, but the risk of injury, death, property damage or infrastructure damages varies depending how the hazard interacts with potential targets. Dead

trees within the wildland urban intermix or wildland urban interface or urban areas therefore pose a greater risk to due to their proximity to residents, businesses, and road, power, and communication infrastructure.

Dead trees may fall or deteriorate in their entirety or in part – either mechanism has the potential for injury, death, or inflicting severe damage to targets. As the time since tree mortality increases, so does the deterioration of wood and the potential for tree failure.

Primary impacts include facility damage due to falling trees and increased fuels for wildfire proliferation.

Assets at Risk

All water and sewer assets are vulnerable to tree mortality due to physical damage or by wildfire.

Wildfire

Likelihood of Future Occurrence–Highly Likely

Vulnerability–High

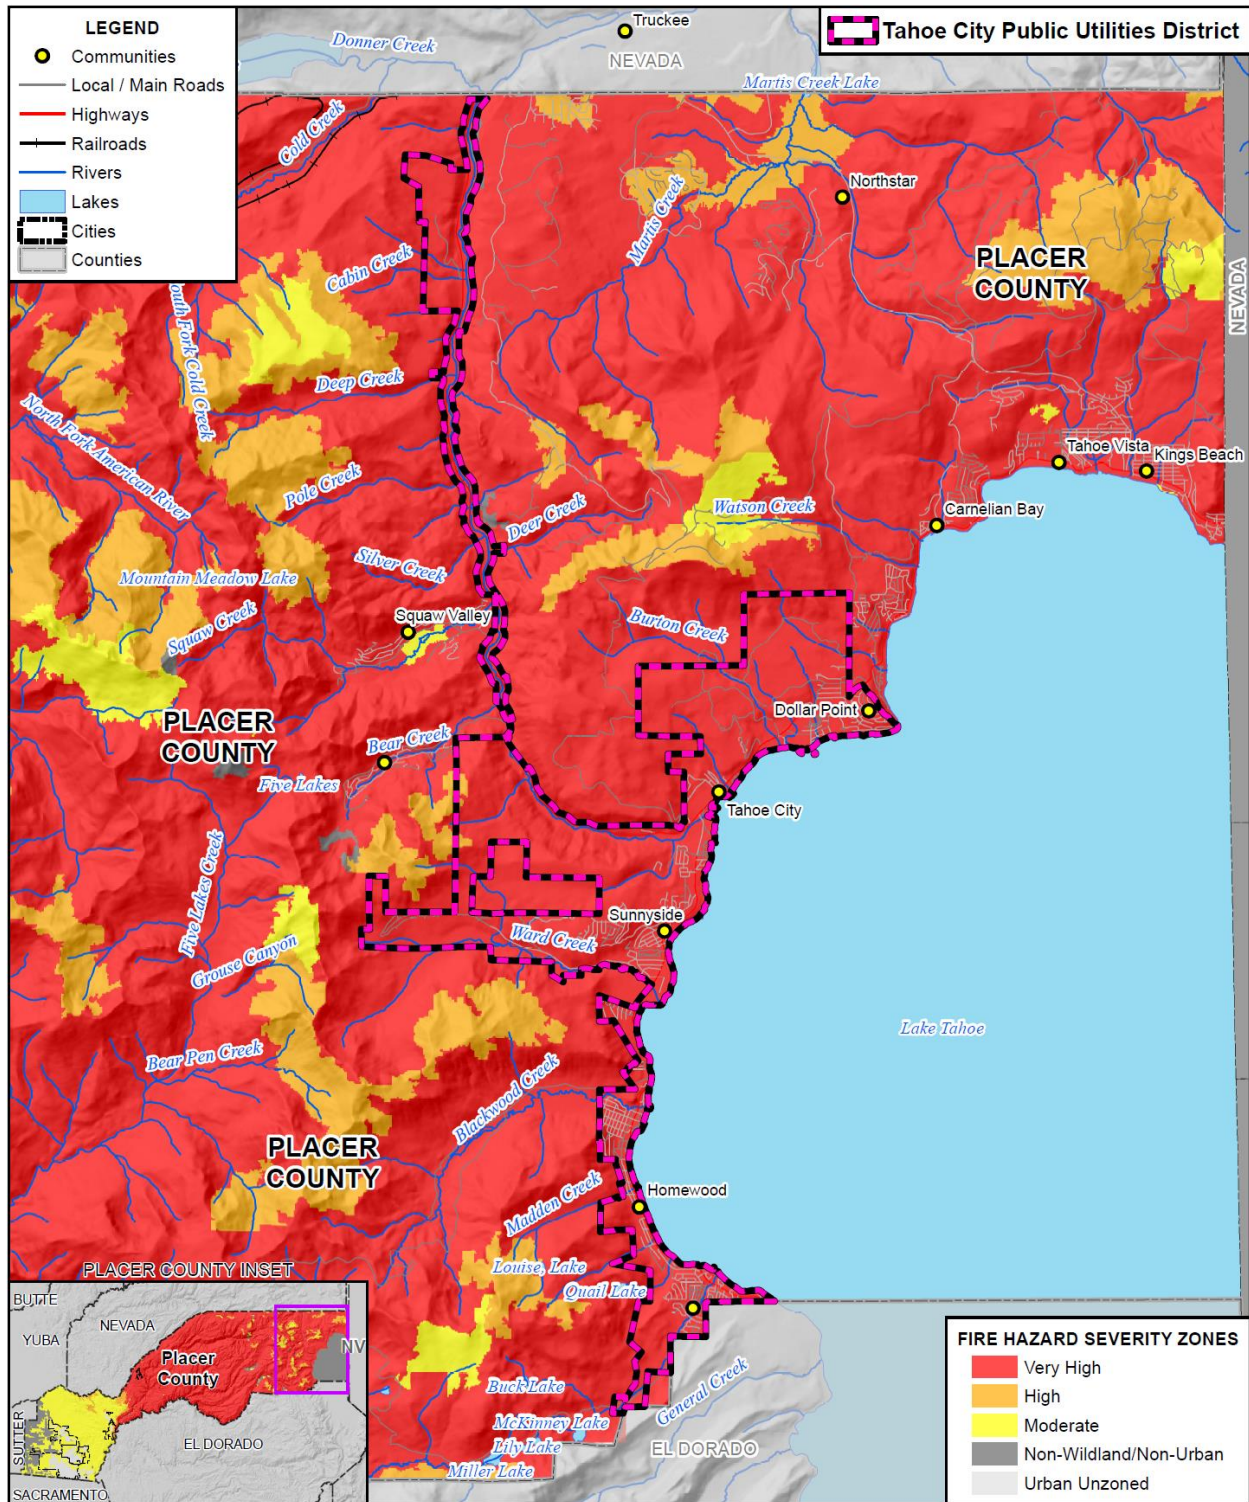

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the TCPUD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the TCPUD were created. Figure W-2 shows the CAL FIRE FHSZ in the District. As shown on the maps, FHSZs within the District range from High to Very High.

Figure W-2 TCPUD – Fire Hazard Severity Zones

COUNTY OF
Placer

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table W-6.

Table W-6 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

The District was affected by the Washoe Fire. This fire occurred in the wildland urban interface area of Tahoe Park and Tahoe Woods Subdivision, along the West shore of Lake Tahoe. The fire was caused by a failure of some propane equipment. Although no lives were lost, the fire destroyed 5 residential structures and encompassed 19 acres. Power and gas utilities were incurred damages. There were also losses to timber assets, loss of watershed protection, and loss of the aesthetic value of a scenic corridor. This event caused major disruptions to west shore and Tahoe City traffic and business on a busy summer weekend. Highway 89, West Lake was closed for a period of time.

Lastly, impacts from smoke and air quality issues have become a regular occurrence due to the marked increase in wildfire activity in Northern and Central California. Poor air quality has resulted in disruption of District maintenance activities due the work force being sent home or sequestered inside due to local air quality warnings by the local AQMD.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on

watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

Further, many of the communities in the District are limited to one route access and egress in the event of a major wildfire. Historically, these routes are closed during major events, stranding many people, including visitors, away from their families and homes. So far there has been no loss of life attributed to the limited evacuation routes, but it is likely only a matter of time before people are cut off and trapped by a major fire event.

Lastly, impacts from smoke and air quality issues have become a regular occurrence due to the marked increase in wildfire activity in Northern and Central California. Poor air quality has resulted in disruption of District maintenance activities due the work force being sent home or sequestered inside due to local air quality warnings by the local AQMD.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's energy companies (including PG&E and Liberty Utilities), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Assets at Risk

All above ground structures and those requiring electricity to operate are at risk to wildfire and PSPS, including all sewer and water pumping facilities, administrative office facilities, and equipment storage facilities.

W.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

W.6.1. Regulatory Mitigation Capabilities

Table W-7 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the TCPUD.

Table W-7 TCPUD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	N	
Capital Improvements Plan	Y	Plan includes projects that address hazards, and are included in mitigation strategies.
Economic Development Plan	N	
Local Emergency Operations Plan	Y 2013	TCPUD Emergency Response Plan, Jan. 2018. Plan typically addresses response to an emergency and not mitigation.
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	Y	Sewer System Management Plan, May 2019 Urban Water Management Plan, July 2016
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	N	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	Y	Rating: 4
Site plan review requirements	N	

		Is the ordinance an effective measure for reducing hazard impacts?
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Most projects that serve as mitigation strategies are captured within Capital Improvement Plan. The District will seek to actively pursue these measures in the future. When the CIP is updated, hazards and their mitigation will be reviewed and incorporated, as necessary.		

Source: TCPUD

Tahoe City Public Utilities District Emergency Response Plan, 2018

The TCPUD Emergency Response Plan serves as a guide for the District’s response to emergencies/disasters within District boundaries, and to coordinate and assist with disaster response in neighboring jurisdictions.

Tahoe City Public Utilities District Sewer System Management Plan, 2014

The TCPUD Sewer System Management Plan serves as a guide for Districts response to emergencies/disasters within District boundaries as it relates to its sewer collection system.

Codes and Ordinances

Avalanche

Placer County’s avalanche management program defines Potential Avalanche Hazard Areas (PAHAs) where the minimum probability of avalanche occurrence is 1 in 100 per year or where avalanche damage has already occurred. According to the Placer County Avalanche Ordinance the following information must be disclosed in PAHAs:

- Identification that a structure is within a PAHA
- A warning that avalanche control work is conducted in the area and avalanche warnings will be provided as feasible
- Identification of sources that provide weather information and general information on avalanches

In addition, the county limits construction as necessary in PAHAs and will not issue a building permit for construction in a PAHA without certifying that the structure will be safe under the anticipated snow loads and conditions of an avalanche.

Tahoe City Public Utilities District Ordinances and Permits

TCPUD has enacted several ordinances:

- Water Ordinance 263
- Sewer Ordinance 255

In addition, the District has water and sewer permit requirements specific to:

- New Construction
- Tear Down-Rebuilds and Remodels

W.6.2. Administrative/Technical Mitigation Capabilities

Table W-8 identifies the District department(s) responsible for activities related to mitigation and loss prevention in TCPUD.

Table W-8 TCPUD’s Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	TCPUD maintains and implements a preventative maintenance program on all of its facilities. TCPUD maintains a staff, fleet and equipment capable of implementing this maintenance program.
Mutual aid agreements	Y	TCPUD actively participates in a local mutual aid agreement with other agencies
Other		
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	N	
Floodplain Administrator	N	
Emergency Manager	Y FT	Utilities/Risk Coordinator is trained on hazards and mitigation.
Community Planner	N	
Civil Engineer	Y FT	Engineering/Senior Civil Engineer is trained on hazards and mitigation.
GIS Coordinator	Y FT	Information Systems and Technology Administrator is trained on hazards and mitigation.

Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Fire and Security alarm. Telemetry for the sewer and water stations. Cell phone and radio communications.
Hazard data and information	N	
Grant writing	Y	Grants and Community Information Administrator
Hazus analysis	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Continued development of communication and network infrastructure in the area.		

Source: TCPUD

W.6.3. Fiscal Mitigation Capabilities

Table W-9 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table W-9 TCPUD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Replacing or upgrading infrastructure
Authority to levy taxes for specific purposes	Y	Replacing or upgrading infrastructure
Fees for water, sewer, gas, or electric services	Y	Ongoing operation and maintenance
Impact fees for new development	Y	Replacing or upgrading infrastructure
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	Replacing or upgrading infrastructure
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	Y	Both the Lake Tahoe Restoration Act and USFS Omnibus Funding have been used for Fuels Thinning and Water System Improvements to enhance fire protection capabilities. Future funding may be available pending approval of a new Lake Tahoe Restoration Act.

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
State funding programs	Y	Funding sources from Propositions 50 and 84 and the State Revolving Fund have been used for water and sewer system improvements improving fire protection capacity of the water system and sewer storage and pumping capacity of the sewer system. Future funding may be available in future Propositions as well as State Revolving Funds (SRF) pending approval of submitted projects.
Other		
How can these capabilities be expanded and improved to reduce risk?		
Any additional funding for infrastructure, specifically water for fire suppression, from federal, state or local sources would be beneficial.		

Source: TCPUD

W.6.4. Mitigation Education, Outreach, and Partnerships

Table W-10 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table W-10 TCPUD’s Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Yes	Truckee River Basin Working Group, Red Cross, Truckee River Watershed Council
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Yes	TCPUD water conservation programs. See http://conservation.tcpud.org/
Natural disaster or safety related school programs	No	
StormReady certification	No	
Firewise Communities certification	No	
Public-private partnership initiatives addressing disaster-related issues	Yes	Work with Red Cross on storage of their emergency response equipment for local use.
Other		
N/A		
How can these capabilities be expanded and improved to reduce risk?		
Continued partnerships with pertinent stakeholders to bring ideas and projects forward, and support each other’s organization by providing collaborative expertise when needed.		

Source: TCPUD

W.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

- Staff educated in the Safety Program
- Website and Quarterly Newsletters to the general public
- Upgrading generators at all pump stations
- Retro fit stations (fire proofing, flood proofing, etc.)
- Fuel Reduction around facilities
- Staff training

Water System, Fire Protection Improvements

Also in the aftermath of the Angora fire in 2007, TCPUD has completed a full analysis of its water systems and is prioritizing the capital improvements necessary to increase fire protection capabilities. Since a significant amount of the District's sub-regional water systems are more than 40 years old and were acquired at various times from developers or other companies, extensive infrastructure work is necessary to meet current standards. TCPUD has successfully worked with the local fire departments, state and federal legislators, and officials to help secure the millions of funding needed to implement recommended improvements. Since 2008, the District has received over \$6,000,000 in funding from various sources for water system improvements.

2007 Phase 1 – Highlands Fuel Reduction

Fuel reduction, mastication and track chipping on 25 acres of District owned open space. This property is bounded by North Tahoe High School and single family homes. The fire potential was considered high. This work was completed in 2010.

2008 Blackwood Pump Station Storm Damage

1996 Blackwood Creek overflow flood damage to the Blackwood sewer pump station. F.E.M.A. repair assistance received in the amount of \$46,645.00. The T.C.P.U.D. funded a complete retrofit of the pump station at an additional cost of \$108,000.00. This retrofit protects the pump station from future flooding and the potential for a large sewage spill into Lake Tahoe. The project was completed in 2008.

2009 Fuel Reduction Program – Chambers Foothills and Quail Lake

Chambers Foothills and Quail Lake Fuel Reduction program, mechanical & hand treatment on 70 acres. Project funded by Nevada and California Fire Safe Council and T.C.P.U.D. participation funding. Grant funding not to exceed \$175,000. District participation will be \$56,000. The property is bounded by single family homes and commercial business property.

Seismic Stability Study and Retrofit

The District owns eleven (11) water storage tanks. The seismic stability of these tanks was last analyzed in a report prepared by Nolte Associates dated January 2006 and September 2010. Of the 11 analyzed tanks:

- One (1) was built in 2005 and is seismically stable and requires no retrofits (Upper Highlands).
- One (1) is seismically unstable and requires a major foundation and shell retrofit or requires a change in its operational water level (Lower Highlands).
- One (1) is seismically unstable and due to its age and material requires a complete replacement (Bunker), replaced in 2019
- Eight (8) are seismically stable with minor improvements recommended.

Tahoe Cedars Water System Interconnection and Distribution Project

In January 2018, TCPUD acquired and began operating the Tahoe Cedars Water System (formerly Mid Sierra Utilities). Since the acquisition, TCPUD Board of Directors has dedicated significant time towards understanding how to invest in and improve the water supply and fire suppression capabilities of the Tahoe Cedars System.

TCPUD identified a high priority need for backup water supply and additional water storage for the Tahoe Cedars System. The system has been in operation for over 50 years and relied that whole time on one groundwater source with no appreciable backup supply. To correct this, the District developed a project to interconnect the Tahoe Cedars System to the TCPUD's McKinney-Quail Water System. The Project provides the needed backup water supply and emergency water storage, in addition to replacement of critical water system components to enhance fire protection and improve water delivery and pressure. The Project was completed in 2018 at a cost of \$1.92 million.

Madden Creek Water System Interconnection and Distribution Project

In January 2018, TCPUD acquired and began operating the Madden Creek Water System (formerly Mid Sierra Utilities). Since the acquisition, TCPUD Board of Directors has dedicated significant time towards understanding how to invest in and improve the water supply and fire suppression capabilities of the Madden System.

TCPUD identified a high priority need for backup water supply and additional water storage for the Madden System. To accomplish this, the District developed this project to interconnect the Madden System to the TCPUD's McKinney-Quail Water System. The Project will provide the needed backup water supply and emergency water storage, in addition to replacement of critical water system components to enhance fire protection and improve water delivery and pressure.

Due to the size and complexity of the Project, it has been broken into a two-phased construction schedule; the first phase includes the McKinney-Quail interconnection and associated high pressure transmission line replacement, and the second phase includes water distribution, servicing, and fire protection improvements. Phase 1 construction was completed in 2019 at a cost of \$970,000. Phase 2 is scheduled to be completed in Summer of 2021 at a cost of \$2.3 million.

The project benefits the public by enhancing water supply and reliability as well as improving fire protection within the water system service area.

Tahoe Cedars and Madden Creek Systems Master Plans

In January 2018, TCPUD acquired and began operating the Tahoe Cedars and Madden Creek Water Systems (formerly Mid Sierra Utilities). Since the acquisition, TCPUD Board of Directors has dedicated significant time towards understanding how to invest in and improve the water supply and fire suppression capabilities of these systems and has already provided critical interconnectivity for these systems as discussed above.

However, the majority water distribution systems within these two water service areas are failing and lacks critical basic fire protection needs such as fire hydrants and adequate flow, pressure and storage to support basic fire suppression activities. The District hired Carollo Engineers in 2020 to prepare a comprehensive waters system master plans for both systems. The final plans are due to be completed in 2021 and provide the framework for essentially full system replacements for both service areas. The estimated cost to complete the master plans is approximately \$215,000. Initial system replacement estimates for both systems combines is approximately \$50 million dollars.

Timberland Interconnection and Distribution Improvements

In January 2018, TCPUD acquired the former Timberland Water Company and began providing water service to Timberland's former customers on January 2, 2018. Following the acquisition, the TCPUD Board of Directors has dedicated significant time in understanding how to invest in and improve the water supply and fire suppression capabilities of the system.

Phase I of the Project was completed in 2019. This phase included installation of approximately 4,440 linear feet of 8-inch water main, 487 linear feet of 4-inch water main, 80 service reconnections and meters, 10 new fire hydrants, and 6 refurbished fire hydrants to replace the varying 2-inch to 6-inch existing system infrastructure.

Phase II completed the Project in 2020 by constructing the remaining new waterlines, service laterals, valves and fire hydrants on roads north of Sugar Pine Road on Cedar Lane, Rustic Lane, and Shady Lane, as well as Timberland Lane and Hwy 89.

The project benefits public health through enhancement of water supply and reliability as well as improving fire protection within the water system service area. Total cost for Phase 1 and II was \$3.6 million.

West Lake Tahoe Regional Water Treatment Plant

The Tahoe City Public Utility District (TCPUD) is undertaking the construction of a permanent, year round drinking water treatment plant to replace the temporary seasonal treatment plant located at Chambers Landing. The new water treatment plant will provide a reliable, drought-resistant, and safe drinking water source to the TCPUD's McKinney-Quail Water Service area and, potentially, other water systems in the West Lake Tahoe region.

In October of 2015, the TCPUD Board of Directors completed the California Environmental Quality Act (CEQA) review process for the project, adopting a Mitigated Negative Declaration and Mitigation

Monitoring & Reporting Program and approving the project. The Project is out to public bid as of February 26, 2021 and scheduled to be awarded and begin construction in mid-2021.

Backup Generator Installations

The TCPUD currently operates a total of 32 permanent generator sites within our service territory to power critical water and sewer pumping facilities. In addition, the TCPUD owns and operates a fleet of 5 portable generators that can be towed anywhere in the District. Since 2016, the TCPUD has installed or acquired 9 new fixed generator sites.

These generators supply emergency power supply to critical facilities during power outages caused by a multitude of hazards including weather related power outage events, PSPS outage events, and possible power disruption due to wildfire.

W.7 Mitigation Strategy

W.7.1. Mitigation Goals and Objectives

The TCPUD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

W.7.2. Mitigation Actions

The planning team for the TCPUD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Drought & Water Shortage
- Severe Weather: High Winds and Tornadoes
- Tree Mortality
- Wildfire

Though initially considered a priority hazard, due to the difficulty in the District in having direct mitigation actions for high winds, it was dropped as a hazard for mitigation planning purposes. The hazards addressed below still include high wind, as its effects are mitigated by these actions.

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each

jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. West Shore Storage Augmentation Project

Hazards Addressed: Wildfire, Tree Mortality, High Winds, Drought and Water Shortage

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The west shore of Lake Tahoe is comprised of 10 separate public water systems each with its own infrastructure such as water sources, storage tanks, water mains and services. The systems all vary in their ability to provide sufficient fire flow rates and volume due to differing hydraulic grade lines (elevation of the tanks) and varying capacities of storage tanks. Most systems fall short of meeting basic fire code requirements for fire flow rates and volumes to provide adequate duration of flow.

Project Description: This project proposes to construct two new storage tanks to interconnect with two existing storage tanks to create a network of storage facilities at the same elevations which will interconnect 6 of those 10 systems. In addition, once interconnected, all systems will have access to approximately 1 million gallons per day of treated surface water from Lake Tahoe from the West Lake Tahoe Regional Water Treatment Plant which begins construction in 2021.

Other Alternatives:

- Build six new tanks and build surface water treatment plants for each system.
- No Project - Continue to operate fractured water systems with significant fire flow storage and flow deficiencies

Existing Planning Mechanism(s) through which Action Will Be Implemented: Master plan will be completed for this project in 2021

Responsible Agency/ Department/Partners: Tahoe City Public Utility District

Cost Estimate: \$5.0 million

Benefits (Losses Avoided): Ability to prevent structure fires from entering the WUI, structure protection from wildfires entering the WUI, drought resistant source capacity.

Potential Funding: Placer County Water Agency, SRF, Rate Revenue, Ad Valorem Property Tax

Timeline: 2021-2024

Project Priority (H, M, L): High

Action 2. Tahoe Cedars Water System Interconnection and Distribution Project

Hazards Addressed: Wildfire, Tree Mortality, High Winds, Drought and Water Shortage

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The Tahoe Cedars Water system was originally built in the 1950's and to support the Tahoma subdivision. The system is largely comprised of smaller 4 inch diameter water mains and is approximately 75% deficient in the necessary number of fire hydrants required to meet modern fire codes.

Project Description: This project proposes to rebuild approximately 80,000 lineal feet of water main, install approximately 100 fire hydrants and approximately 1,180 water services and meters. Approximately 15,000 feet of pipeline is located in Placer County.

Other Alternatives: No Project - Continue to operate a system that cannot support modern fire suppression measures.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Master plan completed for this project in 2021

Responsible Agency/ Department/Partners: Tahoe City Public Utility District

Cost Estimate: \$45 million (Approximately \$5 million in Placer County)

Benefits (Losses Avoided): Ability to prevent structure fires from entering the WUI, structure protection from wildfires entering the WUI, reduce water use by replacing leaking infrastructure and by installation of water meters.

Potential Funding: Placer County Water Agency, SRF, Rate Revenue, Ad Valorem Property Tax

Timeline: 2021-2030

Project Priority (H, M, L): High

Action 3. Madden Creek Water System Interconnection and Distribution Project

Hazards Addressed: Wildfire, Tree Mortality, High Winds, Drought and Water Shortage

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The Madden Creek Water system was originally built in the 1930s and 1940s to support the small summer home community of Homewood. As time went on the water system began to serve both year round residences and commercial businesses. The system is largely comprised of smaller 2 inch diameter water mains and is approximately 75% deficient in the necessary number of fire hydrants required to meet modern fire codes.

Project Description: This project proposes to rebuild approximately 24,000 lineal feet of water main, 40 fire hydrants and approximately 150 water services and meters.

Other Alternatives: No Project - Continue to a system that cannot support modern fire suppression measures.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Master plan completed for this project in 2021

Responsible Agency/ Department/Partners: Tahoe City Public Utility District

Cost Estimate: \$3.8 million

Benefits (Losses Avoided): Ability to prevent structure fires from entering the WUI, structure protection from wildfires entering the WUI, reduce water use by replacing leaking infrastructure and by installation of water meters.

Potential Funding: Placer County Water Agency, SRF, Rate Revenue, Ad Valorem Property Tax

Timeline: 2021-2025

Project Priority (H, M, L): High

Action 4. West Lake Tahoe Regional Water Treatment Plant

Hazards Addressed: Wildfire, Tree Mortality, High Winds, Drought and Water Shortage

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The west shore of Lake Tahoe is comprised of 10 separate public water systems each with its own infrastructure such as water sources, storage tanks, water mains and services. The primary source of water in these systems is groundwater. Groundwater in this area of the Tahoe basin is subject to widely variable water quality as well as limited availability during prolonged drought periods. The use of Lake Tahoe as a dedicated source of drinking water will provide a drought tolerant source of water with predictable quality and the necessary firm capacity to provide water supply during wildfire events.

Project Description: This project proposes to construct a new water treatment plant capable of providing up to 1 million gallons a day of drinking water to the Placer County communities of Tahoma north to the Timberland Subdivision. The plant will be designed to be expandable to 1.5 million gallons per day in the future.

Other Alternatives:

- Replace individual wells with individual surface water plants.
- No Project - Continue to operate fractured water systems with individual wells subject to water quality and supply issues

Existing Planning Mechanism(s) through which Action Will Be Implemented: Preliminary Design Report completed in 2014.

Responsible Agency/ Department/Partners: Tahoe City Public Utility District

Cost Estimate: \$15 million

Benefits (Losses Avoided): Drought resistant source capacity, ability to prevent structure fires from entering the WUI, structure protection from wildfires entering the WUI, drought resistant source capacity.

Potential Funding: Placer County Water Agency, SRF, Rate Revenue, Ad Valorem Property Tax

Timeline: 2021-2024

Project Priority (H, M, L): High

Annex X Truckee Fire Protection District

X.1 Introduction

This Annex details the hazard mitigation planning elements specific to Truckee Fire Protection District (Truckee FPD), a previously participating jurisdiction to the 2016 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to Truckee FPD, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

X.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table X-1. Additional details on plan participation and District representatives are included in Appendix A.

Table X-1 Truckee FPD – Planning Team

Name	Position/Title	How Participated
Bill Seline	Fire Chief	Attended meetings, provided hazard identification table. Provided information on vulnerability of the District to hazards of concern.
Rod Brock	Div. Chief	Review of local hazards, priorities and possible mitigation
Jeff Dowling	Forester	CWPP, Maps, projects concerning wildfire mitigations and fuel reduction
Kevin McKechnie	Fire Marshal	Review of local hazards, priorities and possible mitigation

Coordination with other community planning efforts is paramount to the successful implementation of this LHMP Update. This section provides information on how the District integrated the previously approved 2016 Plan into existing planning mechanisms and programs. Specifically, the District incorporated into or implemented the 2016 LHMP through other plans and programs shown in Table X-2.

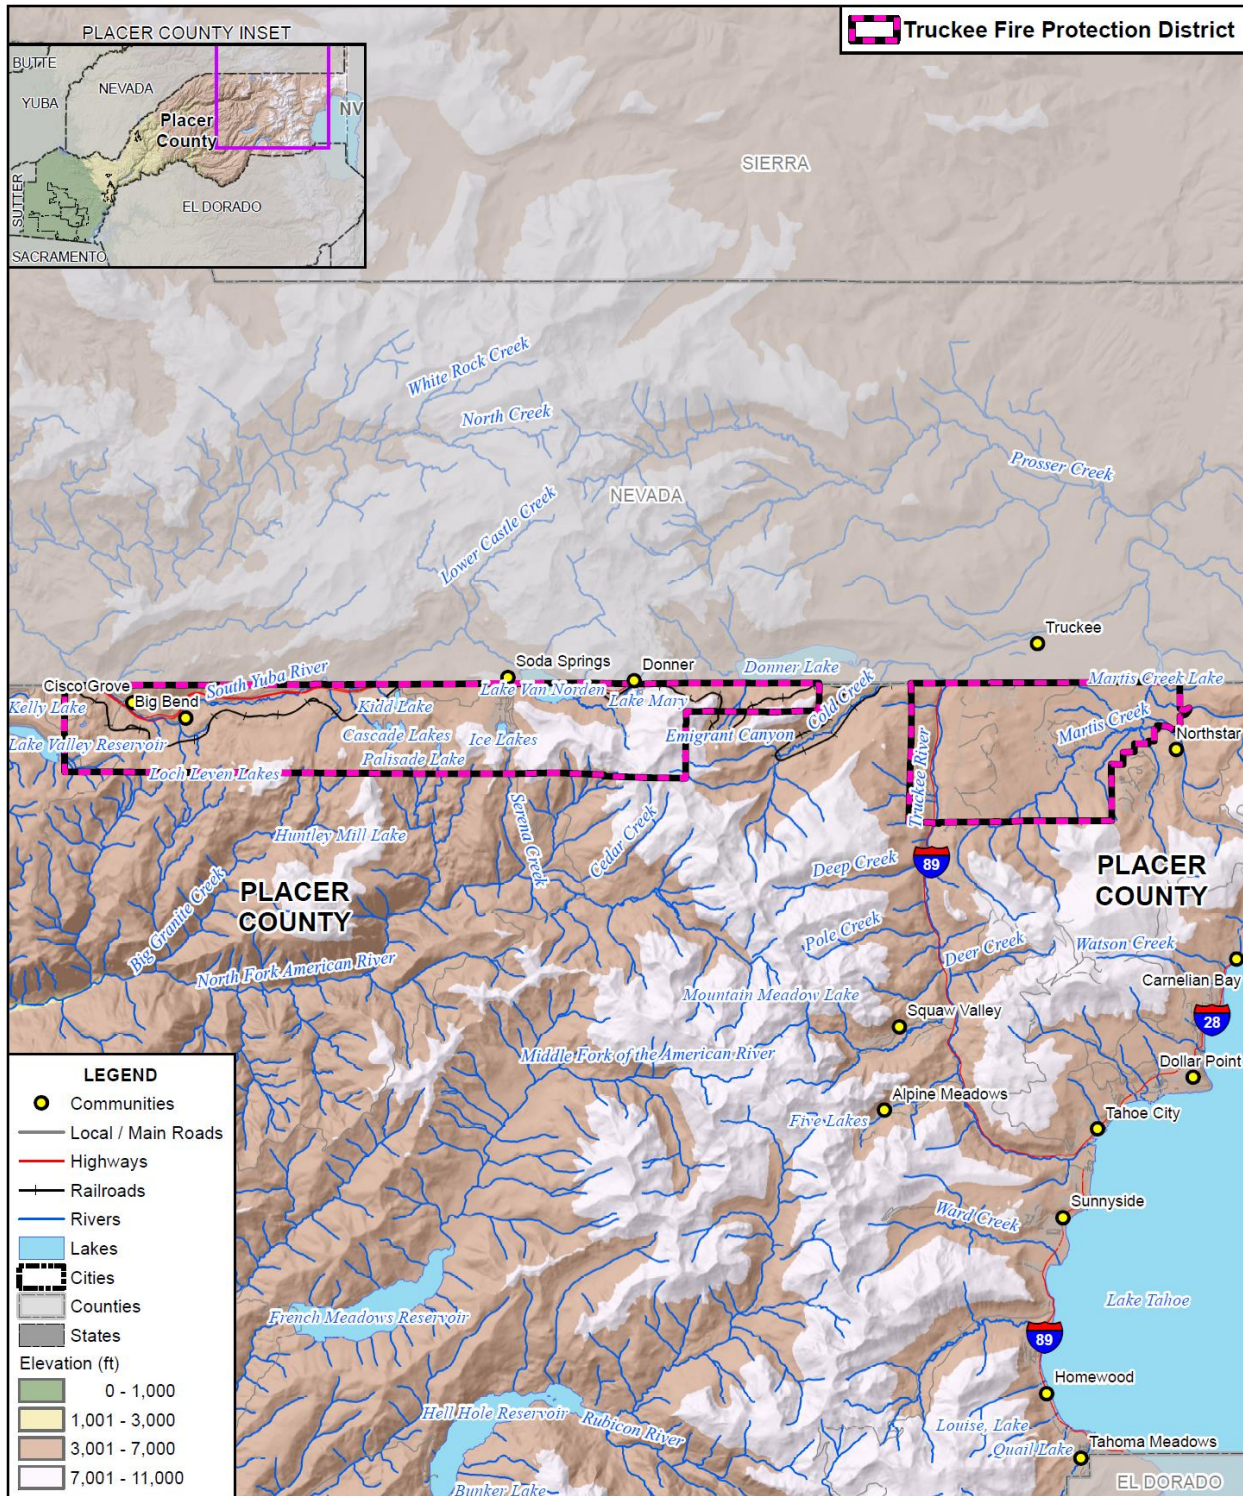

Table X-2 2016 LHMP Incorporation

Planning Mechanism 2016 LHMP Was Incorporated/Implemented In.	Details: How was it incorporated?
N/A	No mitigation planning mechanisms have been completed since 2016

X.3 District Profile

The District profile for the Truckee FPD is detailed in the following sections. Figure X-1 displays a map and the location of the District within Placer County.

Figure X-1 Truckee FPD

Data Source: Placer County GIS, Cal-Atlas, NVBLM; Map Date: 2021.

X.3.1. Overview and Background

Truckee FPD is officially responsible for 125 square miles and is one of the oldest fire districts in the Truckee Tahoe area of Northern California. A public agency, supported by public funds, the District operates under Fire District Law established in 1987 and is an independent Special District.

The District's business is the protection of life and property through the provision of fire rescue and emergency medical services. This District offers a high level of service to our mountain community and outlying areas and is made up of 49 full time and 9 part time and/or volunteer members.

X.4 Hazard Identification

Truckee FPD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table X-3).

Table X-3 Truckee FPD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Extensive	Occasional	Limited	Low	Medium
Avalanche	Limited	Occasional	Limited	Low	Medium
Climate Change	Extensive	Likely	Limited	Low	–
Dam Failure	Limited	Unlikely	Negligible	Low	Medium
Drought & Water Shortage	Extensive	Occasional	Limited	Low	High
Earthquake	Extensive	Unlikely	Critical	Low	Low
Floods: 1%/0.2% annual chance	Limited	Occasional	Limited	Low	Medium
Floods: Localized Stormwater	Limited	Occasional	Negligible	Low	Medium
Landslides, Mudslides, and Debris Flows	Limited	Occasional	Negligible	Low	Medium
Levee Failure	Limited	Unlikely	Negligible	Low	Medium
Pandemic	Extensive	Likely	Critical	Low	Medium
Seiche	Limited	Unlikely	Catastrophic	Low	Medium
Severe Weather: Extreme Heat	Extensive	Unlikely	Limited	Low	High
Severe Weather: Freeze and Snow	Extensive	Highly likely	Limited	Low	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Likely	Negligible	Low	Medium
Severe Weather: High Winds and Tornadoes	Extensive	Likely	Negligible	Low	Low
Tree Mortality	Limited	Likely	Negligible	Low	High
Wildfire	Extensive	Likely	Catastrophic	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

X.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District's hazards and assess the District's vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

X.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section X.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table X-3) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

X.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District's total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the Truckee FPD's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table X-4 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. Truckee FPD’s physical assets, valued at over \$48 million, consist of the buildings and infrastructure to support the District’s operations.

Table X-4 Truckee FPD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
Fire station 91	Administrative station	\$10 million	Wildfire, earthquake
Fire Station 92	Ambulance and Engine	\$10 million	Wildfire, earthquake
Fire Station 95	Ambulance and Engine	\$8 million	Wildfire, earthquake
Fire Station 96	Ambulance and Engine	\$10 million	Wildfire, earthquake
Fire Station 97	Ambulance and Engine	\$10 million	Wildfire, earthquake

Source: Truckee FPD

Populations Served

Also potentially at risk should the District be affected by natural hazard events are the populations served by the District. TFPD provides services to over 20,000 residents and thousands more visitors to the lakes, forests, campgrounds and ski areas. Additionally, services are provided to the users of the transcontinental railroad, Interstate 80, five area lakes and Truckee Tahoe Airport.

Natural Resources

Truckee FPD has a variety of natural resources of value to the District. These natural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Historic and Cultural Resources

Truckee FPD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Current development is at its highest level in 15 years in the Truckee area including over 500 large single family residences that have been or being built in the Martis Camp and Coldstream subdivisions, multiple other multi-family units with 50-100 units each, many in-fill commercial and single family residences throughout the area. Other longer range developments are planned in the Donner Summit area and the area east of the Glenshire. All of the new and proposed developments are within the wildland urban interface.

Development since 2016

No District facilities have been constructed since 2016.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallel that of the Tahoe Area of the Placer County Planning Area. The District Service area remains the same, however, construction of a new planned fire station (Station 90) is being considered, pending design and financing approval by the Board, with a goal to be completed by 2023. The station will be located near downtown Truckee and will serve that area and areas north of town. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

X.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table X-3 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Wildfire

Likelihood of Future Occurrence–Likely

Vulnerability–Extremely High

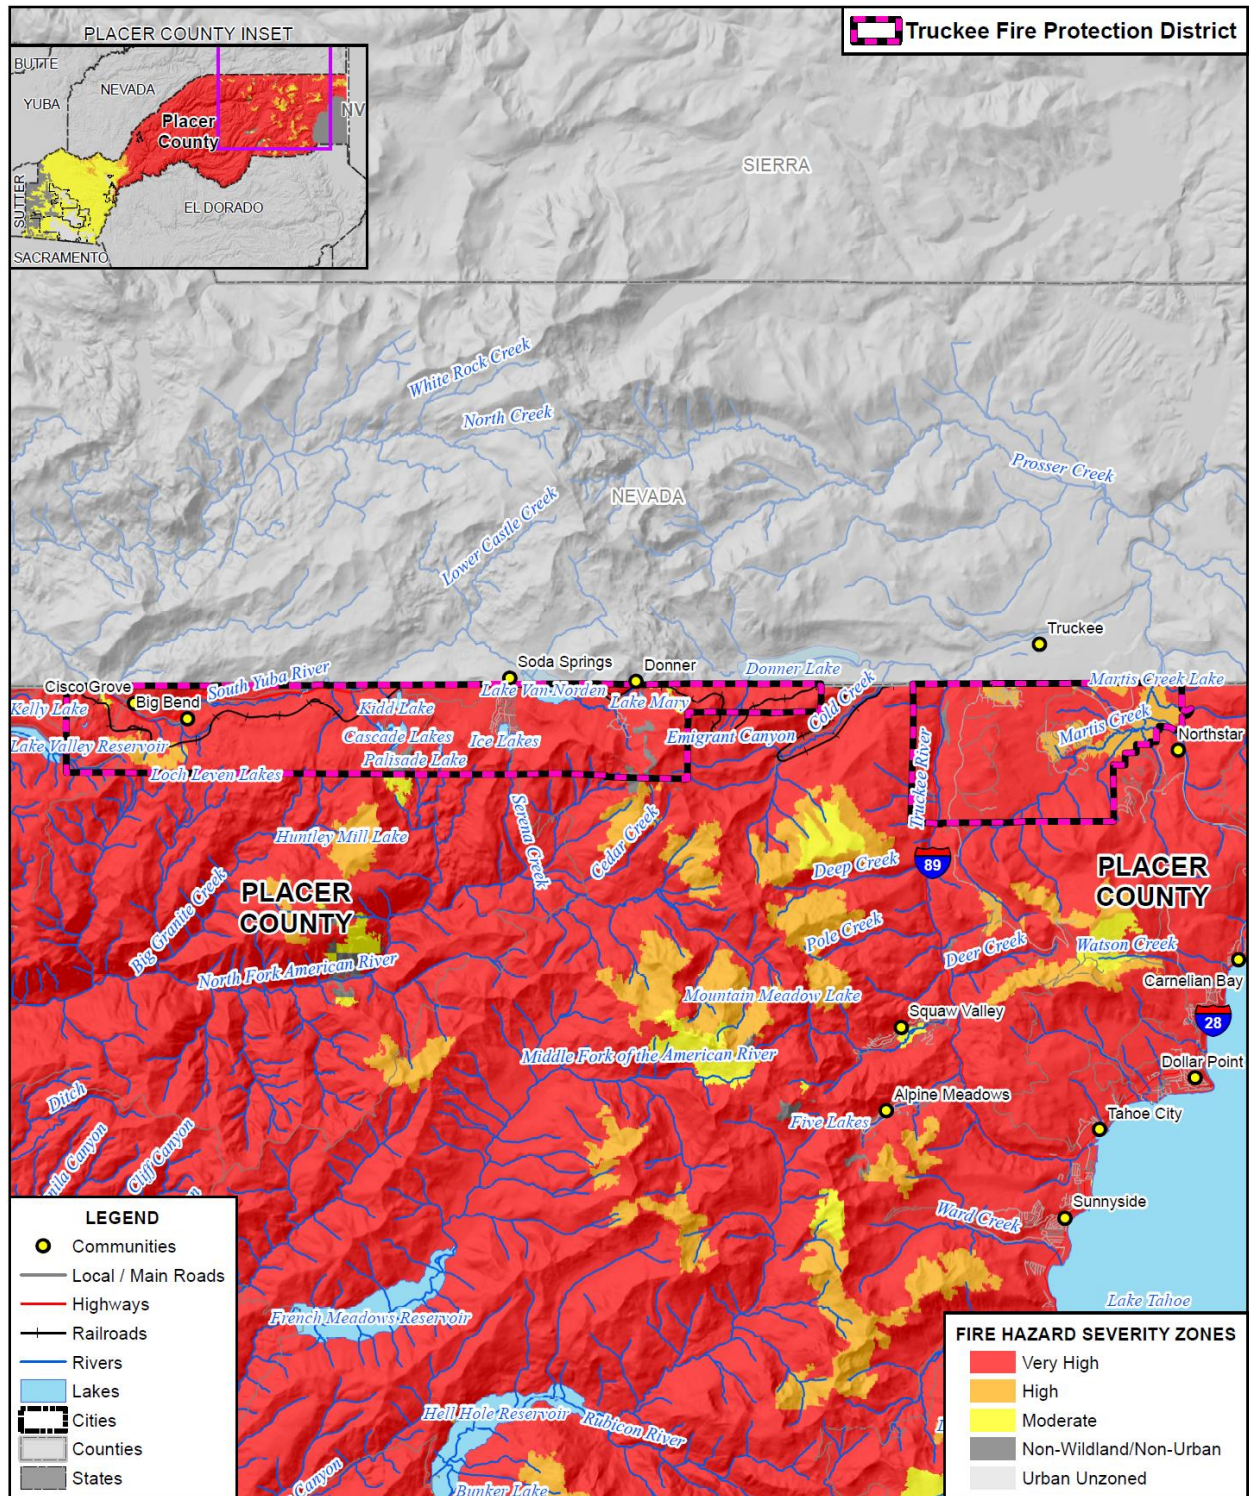

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the Truckee FPD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel, accumulation of vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the Truckee FPD were created. Figure X-2 shows the CAL FIRE FHSZ in the District. As shown on the maps, fire hazard severity zones within the District range from Moderate to Very High.

Figure X-2 Truckee FPD – Fire Hazard Severity Zones

Data Source: Cal-Fire (Draft 09/2007 - c31fhszl06_1, Adopted 11/2007 - fhszs06_3_31, Recommended 12/2008 - c31fhszl06_3), Placer County GIS, Cal-Atlas, NV/BLM; Map Date: 2021.

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table X-5.

Table X-5 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

Only small, few acre fires occur at most in our Placer areas. Last fire was the King 2014 and the American 2013 that were within 10 miles of our Placer area (Serene Lakes). All of the residential and commercial structures in the Truckee area are in the wildland urban interface and are at risk from a catastrophic fire event.

Every season smoke from large fire affects the Truckee area often for months at a time. The District responded to 20-30 smaller wildland fires each season, any one of which could become a destructive fire in the right conditions. Last season (2020) the area also had a record number of red flag days almost double the average at 15. The District participates in the Statewide mutual aid system and responded to 5 major fires in the state and had resources deployed for months in 2020.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year around fire season, the dry vegetation and hot and sometimes windy weather results in an increase in the number of ignitions. Any fire, once ignited, has the potential to quickly become a large, out-of-control fire. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injuries; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading

water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in a loss of function of buildings and infrastructure. Economic impacts of loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2 of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

The District sees a large number of visitors here for leisure and recreations often not aware of the severe hazard conditions. This coupled with outdoor activities like fireworks, campfires and BBQ's the Truckee area is venerable to a large wildfire.

Assets at Risk

All of the District assets are in the WUI and are at risk of being damaged or destroyed in a wildland fire.

X.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, and mitigation education, outreach, and partnerships.

X.6.1. Regulatory Mitigation Capabilities

Table X-6 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the Truckee FPD.

Table X-6 Truckee FPD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan	N	
Capital Improvements Plan	N	New facilitates built to the newest safety standards
Economic Development Plan	N	

Local Emergency Operations Plan	Y	Town of Truckee Plan, no mitigation
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	In progress	Complete in 2016
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Y	Version/Year: Town of Truckee, Placer Co, Nevada Co. It is adequately enforced
Building Code Effectiveness Grading Schedule (BCEGS) Score		Score:
Fire department ISO rating:	Y	Rating: 4
Site plan review requirements	Y	WUI
		Is the ordinance an effective measure for reducing hazard impacts?
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	Y	Wildfire and WUI management of property
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Continuing to encourage a robust local building and fire code helps reduce damage from many types of events		

Source: Truckee FPD

As indicated above, the District has several programs, plans, policies, and codes and ordinances that guide hazard mitigation. Some of these are described in more detail below.

Truckee Fire Evacuation Plan

Truckee Fire Protection District is a bi-county District that also encompasses the incorporated Town of Truckee. Truckee Fire follows the Placer, Nevada counties as well as the Town of Truckee evacuation plans. Each year the agencies meet to coordinate and exercise on the plan.

Fire Hydrant Snow Plan

The winter months bring a special concern to the citizens of Truckee, Donner Summit, and the Truckee Fire District. Winter storms often hide fire hydrants under a mountain of snow, making them impossible to find quickly. In the event of a fire, firefighters have to locate and clear hydrants of snow before they are able to connect hose and establish a water supply to aid in fighting fire. District crews stop at hydrants to clear them of snow. In most locations within the Fire District, hydrants are located 500 feet from one another. Because of the great number of hydrants located within the Fire District, it is virtually impossible to clear every hydrant of snow after each storm. The Fire District has adopted a strategic plan of which hydrants are to be cleared of snow after a snowstorm, depending on life-hazards and proximity to other hydrants which are maintained.

CWPP

Truckee Fire recently received a CAL FIRE grant to hire a consultant to develop a CWPP for the Truckee Fire Protection District. The process was started in the summer of 2015 and is expected to be completed by summer of 2016. Many local stakeholders are involved in the process including the USFS, CAL FIRE, various homeowner associations, State Parks, Town of Truckee, both counties, to name a few. The plan outlines and prioritizes the wildfire risk in the fire district and outlines various projects that will help mitigate the hazard.

The plan was completed, and work outlined in the plan commenced over the last 5 years. The District was awarded over 3 million dollars in grants to do various fuel reduction projects. Currently the District is considering a wildfire measure to raise a sustainable revenue source to do significant fuels reduction work. Prior to beginning work the CWPP will be updated in 2022 to identify a 5-10 year list of fuel reduction projects and wildfire mitigation work.

X.6.2. Administrative/Technical Mitigation Capabilities

Table X-7 identifies the District department(s) responsible for activities related to mitigation and loss prevention in FPD.

Table X-7 Truckee FPD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	In-house forest and WUI experts that inspect residential and commercial properties
Mutual aid agreements	N	
Other	N	

Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	Y	Town of Truckee and County has these offices and coordinates well with TFPD
Floodplain Administrator	N	Town
Emergency Manager	Y	Town and Fire Department
Community Planner	Y	Town
Civil Engineer	Y	Town
GIS Coordinator	N	
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Town of Truckee and both Counties have abilities to communicate with the public. The Fire District can communicate via Nixle
Hazard data and information	Y	Town
Grant writing	Y	TFPD
Hazus analysis	Y	Town
Other		
How can these capabilities be expanded and improved to reduce risk?		
Continuing to encourage a robust local building and fire code helps reduce damage from many types of events.		

Source: Truckee FPD

X.6.3. Fiscal Mitigation Capabilities

Table X-8 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table X-8 Truckee FPD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	N	
Authority to levy taxes for specific purposes	Y	With 2/3 vote.
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	Y	Mitigation fees have supported fire station improvement and additional apparatus
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	N	
Incur debt through private activities	N	
Community Development Block Grant	N	

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Other federal funding programs	Y	
State funding programs	Y	
Other		
How can these capabilities be expanded and improved to reduce risk?		
A local source of revenue from a parcel tax would allow the District to do on-going significant fuel reduction work in the WUI		

Source: Truckee FPD

X.6.4. Mitigation Education, Outreach, and Partnerships

Table X-9 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table X-9 Truckee FPD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	The District started a CERT team with over 100 members over the last 5 years.
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	Various community educational programs including community events and annual school fire safe program
Natural disaster or safety related school programs	Y	School fire safety
StormReady certification	N	
Firewise Communities certification	N	The District has facilitated the creation of over 20 Firewise Communities in the last 5 years
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
The CERT program has recently developed a 2 hour Personal Emergency Preparedness program (PEP) that they are delivering to many HOAs and community groups to share the best practices of emergency preparedness		

Source: Truckee FPD

X.7 Mitigation Strategy

X.7.1. Mitigation Goals and Objectives

The Truckee FPD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

X.7.2. Mitigation Actions

The planning team for the Truckee FPD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

➤ Wildfire

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. 2022 CWPP

Hazards Addressed: Multi-Hazard (Climate Change, Dam Failure, Earthquake, Floods 1%/0.2% annual chance, Pandemic, Seiche, Severe Weather: Freeze and Snow, Wildfire)

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: The Truckee Fire Protection District is a bi-county fire district with residents, visitors, vacant parcels, commercial and residential structures that are in the WUI and at risk of wildfire.

Project Description: Although much work has been completed in the last 5 years there are many more acres on the larger vacant properties needs fuel reduction work. Additionally, residents need support with creating defensible space with things like green waste pickup, chipping, tree removal, support of elderly

and low income. Evacuation routes need vegetation maintenance and evacuation systems like planning and notification need to be advanced with emerging technology.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: The District will hire a consultant to implement the CWPP process involving stakeholders and the general community.

Responsible Agency/ Department/Partners: Truckee Fire

Cost Estimate: CWPP 30k. CWPP work identified will be up to 15 million in projects

Benefits (Losses Avoided): Wildfire prevention

Potential Funding: Grants and a local Wildfire Prevention Parcel Tax Measure (August 2021)

Timeline: CWPP in 2022, projects over next 5 years

Project Priority (H, M, L): H

Annex Y Placer County Air Pollution Control District

Y.1 Introduction

This Annex details the hazard mitigation planning elements specific to Placer County Air Pollution Control District (PCPCAPCD or District), a new participating jurisdiction to the 2021 Placer County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the District. This Annex provides additional information specific to PCAPCD, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

Y.2 Planning Process

As described above, the District followed the planning process detailed in Chapter 3 of the Base Plan. In addition to providing representation on the Placer County Hazard Mitigation Planning Committee (HMPC), the District formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table Y-1. Additional details on plan participation and District representatives are included in Appendix A.

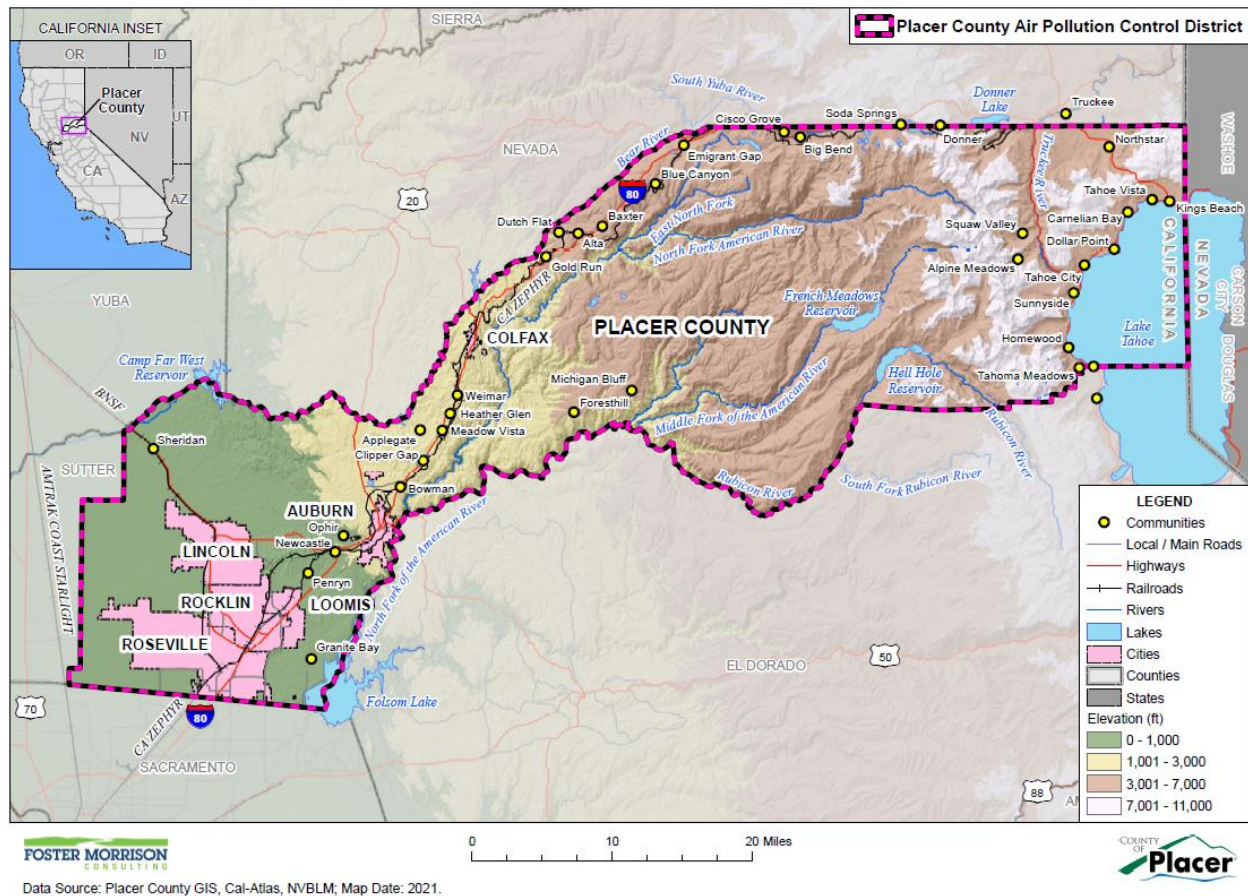

Table Y-1 PCAPCD – Planning Team

Name	Position/Title	How Participated
Adam Baughman	Deputy APCO	Attended LHMP meetings, researched and identified hazards & impacts, prepared feasible mitigation measures worksheets.
Ann Hobbs	Associate Planner	Attended LHMP meetings as needed, reviewed and commented on mitigation measure worksheets.
Molly Johnson	Air Quality Specialist II	Developed mitigation measures, reviewed & commented on LHMP.
Yushuo Chang	Senior Air Quality Planner	Developed mitigation measures, reviewed & commented on LHMP.

Y.3 District Profile

The District profile for the PCAPCD is detailed in the following sections. Figure Y-1 displays a map and the location of the District within Placer County.

Figure Y-1 PCAPCD

Y.3.1. Overview and Background

The District is charged with the enforcement of local air pollution control rules adopted by its Board of Directors, as well as state and federal air quality requirements. The District permits the control of air pollution by businesses, regulates open burning, responds to odor and dust complaints, and encourages the reduction of emissions in areas that are not regulated directly.

There are five air monitoring stations in the County to measure air quality on a 24-hour basis. The District is responsible for preparing, adopting, and implementing air quality plans that seek to achieve and maintain state and federal air quality standards. The District provides incentives to local businesses and agencies to reduce air pollution in our communities. The District participates in and promotes efforts to reduce the impacts of wildfire. The District develops an annual emission inventory of all sources within Placer County. The District reports this information to CARB for inclusion in their statewide database.

The District is governed by a Board of Directors (Board) composed of three County Board of Supervisors and one elected official from each of the six County incorporated municipalities: Auburn, Colfax, Lincoln, Loomis, Rocklin, Roseville. The District’s Board appoints the Director/Air Pollution Control Officer (APCO).

The District currently employs 15 full-time and 4 extra-help employees, and is organized into four operating sections: Administrative Services, Planning & Monitoring, Compliance & Enforcement, and Permitting & Engineering.

The District's current annual budget is approximately \$9.3 million, of which \$2.9 million is included as clean air incentive funding to assist local businesses in obtaining cleaner equipment. Most of the District's operational funding comes from a surcharge imposed by the Department of Motor Vehicles, along with emission and equipment fees assessed on permitted facilities. The District's activities are programmed into five separate funds depending on the revenue source. Each fund has its own revenue and expenditure accounts. The District's philosophy of budgeting revenues conservatively and expenditures adequately has allowed the District to meet its current fiscal needs and provide funding for beginning the upcoming fiscal year.

Y.4 Hazard Identification

PCAPCD identified the hazards that affect the District and summarized their location, extent, frequency of occurrence, potential magnitude, and significance specific to District (see Table Y-2).

Table Y-2 PCAPCD—Hazard Identification Assessment

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agriculture Pests and Diseases	Significant	Highly Likely	Critical	Low	Medium
Avalanche	Limited	Likely	Limited	Low	Medium
Climate Change	Extensive	Likely	Limited	Medium	–
Dam Failure	Significant	Occasional	Critical	Low	Medium
Drought & Water Shortage	Extensive	Likely	Critical	Low	High
Earthquake	Significant	Occasional	Critical	Low	Low
Floods: 1%/0.2% annual chance	Limited	Occasional	Critical	Low	Medium
Floods: Localized Stormwater	Limited	Highly Likely	Limited	Low	Medium
Landslides, Mudslides, and Debris Flows	Limited	Occasional	Limited	Low	Medium
Levee Failure	Limited	Unlikely	Limited	Low	Medium
Pandemic	Extensive	Likely	Catastrophic	Low	Medium
Seiche	Limited	Unlikely	Limited	Low	Medium
Severe Weather: Extreme Heat	Extensive	Highly Likely	Limited	Medium	High
Severe Weather: Freeze and Snow	Extensive	Highly Likely	Critical	Low	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Occasional	Limited	Low	Medium
Severe Weather: High Winds and Tornadoes	Extensive	Highly Likely	Critical	Low	Low
Tree Mortality	Extensive	Likely	Limited	Low	High
Wildfire	Extensive	Highly Likely	Critical	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid				
Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				
	Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

Y.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the District's hazards and assess the District's vulnerability separate from that of the Placer County Planning Area as a whole, which has already been assessed in Section 4.3 Hazard Profiles and Vulnerability Assessment in the Base Plan. The hazard profiles in the Base Plan discuss overall impacts to the Placer County Planning Area and describes the hazard problem description, hazard location and extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the Base Plan.

Y.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section Y.5.3, includes a hazard profile/problem description as to how each medium or high significant hazard (as shown in Table Y-2) affects the District and includes information on past hazard occurrences and the likelihood of future hazard occurrence. The intent of this section is to provide jurisdictional specific information on hazards and further describes how the hazards and risks differ across the Placer County Planning Area.

Y.5.2. Vulnerability Assessment and Assets at Risk

This section identifies the District's total assets at risk, including values at risk, populations at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the District. This data is not hazard specific, but is representative of total assets at risk within the District.

Assets at Risk and Critical Facilities

This section considers the PCAPCD's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this Plan. Critical facilities are defined for this Plan as:

Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.

This definition is further refined by separating out three classes of critical facilities:

Class 1 facilities include those facilities that contribute to command, control, communications and computer capabilities associated with managing an incident from initial response through recovery.

Class 2 facilities include those facilities that house Emergency Services capabilities.

Class 3 facilities are those facilities that enable key utilities and can be used as evacuation centers/shelters/mass prophylaxis sites, etc.

Additional information on the three classes of critical facilities is described further in Section 4.3.1 of the Base Plan.

Table Y-3 lists critical facilities and other District assets identified by the District Planning Team as important to protect in the event of a disaster. PCAPCD’s physical assets, valued at over \$2.6 million, consist of the buildings and infrastructure to support the District’s operations.

Table Y-3 PCAPCD Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Replacement Value	Which Hazards Pose Risk
PCAPCD Offices, 110 Maple St., Auburn, CA 95603	Office Building	\$2,078,298	Wildfire
Air Quality Monitoring Equipment – Stationary	Remote Air Quality Monitoring sites	\$347,830	Wildfire/Snowstorm etc. for Tahoe
Air Quality Monitoring Equipment – Mobile	Air Quality Monitoring Equipment housed in towable District Trailer	\$17,134	Wildfire
District Vehicles (various)	Fleet Vehicles	\$150,000	Wildfire
Weather Monitoring Equipment-Stationary	Remote Weather Monitoring Stations	\$39,946	Wildfire/ Avalanche / Snowstorm, Wind Event
Total		\$2,633,208	

Source: PCAPCD

Natural Resources

PCAPCD has a variety of natural resources of value to the District. These natural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Historic and Cultural Resources

PCAPCD has a variety of historic and cultural resources of value to the District. These historic and cultural resources parallel that of Placer County as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Populations Served

Potentially at risk, should the District be affected by natural hazard events, are the populations served by the District. The PCAPCD provides services to the whole of Placer County.

Growth and Development Trends

General growth in the District parallels that of the Placer County Planning Area as a whole. Information can be found in Section 4.3.1 of the Base Plan.

Future Development

The District has no control over future development in areas the District services. Future development in these areas parallels that of the Placer County Planning Area. More general information on growth and development in Placer County as a whole can be found in “Growth and Development Trends” in Section 4.3.1 Placer County Vulnerability and Assets at Risk of the Base Plan.

Y.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table Y-2 as high or medium significance hazards. Impacts of past events and vulnerability of the District to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Placer County Planning Area). Methodologies for evaluating vulnerabilities and calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the District to each identified priority hazard, in addition to the estimate of likelihood of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Depending on the hazard and availability of data for analysis, this hazard specific vulnerability assessment also includes information on values at risk, critical facilities and infrastructure, populations at risk, and future development.

Climate Change

Likelihood of Future Occurrence—Likely

Vulnerability—Medium

Hazard Profile and Problem Description

Climate change adaptation is a key priority of the State of California. The 2018 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state's infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and earlier runoff of both snowmelt and rainwater in the year. In addition to changes in average temperatures, sea level, and precipitation patterns, the intensity of extreme weather events is also changing.

Location and Extent

Climate change is a global phenomenon. It is expected to affect the whole of the District, Placer County, and State of California. There is no scale to measure the extent of climate change. Climate change exacerbates other hazards, such as drought, extreme heat, flooding, wildfire, and others. The speed of onset of climate change is very slow. The duration of climate change is not yet known, but is feared to be tens to hundreds of years.

Past Occurrences

Climate change has never been directly linked to any declared disasters. While the District noted that climate change is of concern, no specific impacts of climate change could be recalled. The District and HMPC members did, however, note that in Placer County, the strength of storms does seem to be increasing and the temperatures seem to be getting hotter. A protracted, hotter, drier and windier summer season, combined with the cumulative impact of drought conditions, high amounts of excessive vegetation, referred to in fire terms as fuel and tree mortality exacerbates the potential for damaging wildfires. California's Fourth Climate Change Assessment by UC Davis (2018) indicated the impacts of climate change on the Sacramento Region will result in extreme heatwaves, drier landscapes, less snow, variable precipitation, more intense droughts, and increased risk of wildfire. These impacts will lead to a decrease in air quality via higher levels of ground-level ozone and particulate matter (PM), leading to air quality impacts on public health

Vulnerability to and Impacts from Climate Change

The 2014 California Adaptation Planning Guide (APG) prepared by California OES and CNRA was developed to provide guidance and support for local governments and regional collaboratives to address the unavoidable consequences of climate change. California's APG: Understanding Regional Characteristics has divided California into 11 different regions based on political boundaries, projected climate impacts, existing environmental setting, socioeconomic factors and regional designations. Placer County falls within the North Sierra Region characterized as a sparsely settled mountainous region where the region's economy is primarily tourism-based. The region is rich in natural resources, biodiversity, and is the source for the majority of water used by the state. This information can be used to guide climate adaptation planning in the District and Placer County Planning Area.

The California APG: Understanding Regional Characteristics identified the following impacts specific to the North Sierra region in which the Placer County Planning Area is part of:

- Temperature increases
- Decreased precipitation
- Reduced snowpack
- Reduced tourism
- Ecosystem change
- Sensitive species stress
- Increased wildfire

As noted above, many of these impacts will result in increased ground-level ozone and particulate matter (PM), leading to injurious effects on public health. PCAPCD will require increased resources to develop programs and strategies to effectively address this increased air pollution to continue to move toward attainment of state and federal ambient air quality standards. In the case of increased wildfire, there would be an expectation of increased wildfire smoke. This would result in the need to provide clean air shelter and other clean air equipment, including the District's office.

Assets at Risk

The District noted that its facilities will most likely not be at risk from climate change. However, with increased wildfire albeit smoke, the District's main office would need to be kept free from smoke in order for staff to work safely inside.

Severe Weather: Extreme Heat

Likelihood of Future Occurrence—Highly Likely

Vulnerability—Medium

Hazard Profile and Problem Description

According to FEMA, extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. Heat kills by taxing the human body beyond its abilities. In extreme heat and high humidity, evaporation is slowed, and the body must work extra hard to maintain a normal temperature.” Most heat disorders occur because the victim has been overexposed to heat or has over-exercised for his or her age and physical condition. Older adults, young children, and those who are sick or overweight are more likely to succumb to extreme heat.

In addition to the risks faced by citizens of the District, there are risk to the built environment from extreme heat. While extreme heat on its own does not usually affect structure, extreme heat during times of drought can cause wildfire risk to heighten. Extreme heat and high winds can cause power outages and PSPS events, causing issues to buildings in the District.

Extreme Heat and Power Shortage/Power Failure

The US power grid crisscrosses the country, bringing electricity to homes, offices, factories, warehouses, farms, traffic lights and even campgrounds. According to statistics gathered by the Department of Energy, major blackouts are on the upswing. Incredibly, over the past two decades, blackouts impacting at least 50,000 customers have increased 124 percent. The electric power industry does not have a universal agreement for classifying disruptions. Nevertheless, it is important to recognize that different types of outages are possible so that plans may be made to handle them effectively. In addition to blackouts, brownouts can occur. A brownout is an intentional or unintentional drop in voltage in an electrical power supply system. Intentional brownouts are used for load reduction in an emergency. Electric power disruptions can be generally grouped into two categories: intentional and unintentional. More information on types of power disruptions can be found in Section 4.3.2 of the Base Plan.

Public Safety Power Shutoff (PSPS)

A new intentional disruption type of power shortage/failure event has recently occurred in California. In recent years, several wildfires have started as a result of downed power lines or electrical equipment. This was the case for the Camp Fire in 2018. As a result, California's three largest energy companies (including PG&E), at the direction of the California Public Utilities Commission (CPUC), are coordinating to prepare all Californians for the threat of wildfires and power outages during times of extreme weather. To help protect customers and communities during extreme weather events, electric power may be shut off for public safety in an effort to prevent a wildfire. This is called a PSPS. More information on PSPS criteria can be found in Section 4.3.2 of the Base Plan.

Since the District Office is located in the urban downtown of the City of Auburn, power to the building has remained relatively stable during the PSPS events. However, most District employees live outside the city in more rural areas more frequently subject to PSPS. Likewise, the District's air quality monitoring equipment and purple air sensors are located in areas that could be subject to PSPS.

Location and Extent

Heat is a regional phenomenon and affects the whole of the District. Heat emergencies are often slower to develop, taking several days of continuous, oppressive heat before a significant or quantifiable impact is seen. Heat waves do not strike victims immediately, but rather their cumulative effects slowly affect vulnerable populations and communities. Heat waves do not generally cause damage or elicit the immediate response of floods, fires, earthquakes, or other more "typical" disaster scenarios.

The NWS has in place a system to initiate alert procedures (advisories or warnings) when extreme heat is expected to have a significant impact on public safety. The expected severity of the heat determines whether advisories or warnings are issued. The NWS HeatRisk forecast provides a quick view of heat risk potential over the upcoming seven days. The heat risk is portrayed in a numeric (0-4) and color (green/yellow/orange/red/magenta) scale which is similar in approach to the Air Quality Index (AQI) or the UV Index. This can be seen in Section 4.3.2 of the Base Plan.

Past Occurrences

There has been no federal or state disaster declarations in the County for heat. The District Planning Team noted that since extreme heat is a regional phenomenon, events that affected the County also affected the District. Those past occurrences were shown in the Base Plan in Section 4.3.2. Additionally, California's Fourth Climate Change Assessment prepared by UC Davis (2018) expects Sacramento maximum temperatures to be 10 degrees F higher by the end of this century, leading to increasingly poor air quality and increased fire danger. The average number of days exceeding 104 degrees F annually is expected to increase from 4 to 40 by 2100. This will lead to an increase in ground level ozone and a decrease in public health.

Vulnerability to and Impacts from Extreme Heat

The District experiences temperatures in excess of 100°F during the summer and fall months. The temperature moves to 105-110°F in rather extreme situations. During these times, drought conditions may worsen. Also, power outages and PSPS events may occur during these times as well. Health impacts, including loss of life, are the primary concern with this hazard, though economic impacts are also an issue.

Days of extreme heat have been known to result in medical emergencies, and unpredictable human behavior. Periods of extended heat and dryness (droughts) can have major economic, agricultural, and water resources impacts. Extreme heat can also further dry out vegetation, making it more vulnerable to completely burning if a wildfire occurred.

The District noted the following impacts:

- Causes an increase in ozone and ozone exceedances which leads to an increase in public health issues. The western portion of Placer County is in nonattainment area for both the federal and state ambient air quality standards for ozone. While air quality has improved, as it gets hotter more often, it will become increasingly difficult to achieve the standards (greater heat = more ozone due to more reaction with ozone precursor pollutants).
- Causes an increase in wildfire frequency and severity, leads to increase in particulate matter in the air from smoke, increase in public health issues, asthma, etc. While close to meeting the air quality standards, the County is technically in non-attainment of federal and state PM standards as well.
- With respect to wildfire smoke, the Sacramento area air districts have asked the US EPA a number of times, as needed, to make an Exceptional Event finding for the Sacramento Region and to exclude data in the last few years from attainment emissions. Without these Exceptions, the County will most likely not be able to meet the PM standard by the EPA's deadline which could result in repercussions for the area.

Assets at Risk

While none of the District's assets are directly impacted by extreme heat, District resources to address the increased air pollution will be impacted. As ambient and average temperatures rise in the Sacramento Region, it will be increasingly difficult to address the impact on air quality and continue to move the County toward attainment of state and federal air quality standards.

Wildfire

Likelihood of Future Occurrence–Highly Likely

Vulnerability–High

Hazard Profile and Problem Description

Wildland fire and the risk of a conflagration is an ongoing concern for the PCAPCD. Throughout California, communities are increasingly concerned about wildfire safety as increased development in the foothills and mountain areas and subsequent fire control practices have affected the natural cycle of the ecosystem. Wildland fires affect grass, forest, and brushlands, as well as any structures located within them. Where there is human access to wildland areas the risk of fire increases due to a greater chance for human carelessness and historical fire management practices. Historically, the fire season extends from early spring through late fall of each year during the hotter, dryer months; however, in recent years, the risk of wildfire has become a year around concern. Fire conditions arise from a combination of high temperatures, low moisture content in the air and fuel (vegetation), accumulation of excess vegetation, and high winds. While wildfire risk has predominantly been associated with more remote forested areas and wildland urban interface (WUI) areas, significant wildfires can also occur in more populated, urban areas.

Location and Extent

Wildfire can affect all areas of the District. CAL FIRE has estimated that the risk varies across the District and has created maps showing risk variance. Following the methodology described in Section 4.3.19 of the Base Plan, wildfire maps for the PCAPCD were created. Figure Y-2 shows the CAL FIRE Fire Hazard Severity Zones (FHSZ) in the District. As shown on the maps, FHSZs within the District range from Urban/Unzoned to Very High.

Figure Y-2 PCAPCD – Fire Hazard Severity Zones

Wildfires tend to be measured in structure damages, injuries, and loss of life as well as on acres burned. Fires can have a quick speed of onset, especially during periods of drought or during hot dry summer months. Fires can burn for a short period of time, or may have durations lasting for a week or more.

Past Occurrences

There has been five state and six federal disaster declarations for Placer County from fire. These can be seen in Table Y-4.

Table Y-4 Placer County – State and Federal Disaster Declarations Summary 1950-2020

Disaster Type	State Declarations		Federal Declarations	
	Count	Years	Count	Years
Fire	5	1961, 1965, 1973, 1987, 2010	6	2002, 2004, 2008, 2009, 2014 (twice)

Source: Cal OES, FEMA

The District noted the following past events:

- The Trailhead Fire (2016) was across the of Middle Fore of the American River in El Dorado County, but certainly impacted Placer as there was a huge concern it would travel into Todd Valley and the Foresthill area. Although it did not spread into those areas, the smoke significantly impacted the Foresthill area. The highest hourly average PM2.5 concentration was 268 ug/m³. This would be in hazardous level if this value or higher continued for a 24-hour period.
- From an air quality perspective, Placer County has been impacted by the Detwiler (2017), Ferguson (2018), Carr Fire (2018), Mendocino Complex Fire (2018), Camp Fire (2018), Loyalton Fire (2020), SCU Lightning Complex Fire (2020), August Complex Fire (2020), LNU Lightning Fire (2020), and North Complex Fire and countless other wildfires that were smaller in acreage. The smoke from these wildfires impacted Placer County residents significantly, resulting in three (3) days in 2017, 25 days in 2018, and 35 days in 2020 that exceeded the PM2.5 daily average standards, respectively.
- Ten joint Air Quality and Public Health Advisories were issued in 2018 and five were issued in 2020, spanning multiple consecutive days. The District briefed its Board with information items in February 2019 and October 2020 with charts showing the air quality impacts. The District also had one advisory for 2016, two advisories for 2017, and one advisory in 2019.

Vulnerability to and Impacts from Wildfire

Risk and vulnerability to the Placer County Planning Area and the District from wildfire is of significant concern, with some areas of the Planning Area being at greater risk than others as described further in this section. High fuel loads in the Planning Area, combined with a large built environment and population, create the potential for both natural and human-caused fires that can result in loss of life and property. These factors, combined with natural weather conditions common to the area, including lightning strikes, periods of drought, high temperatures, low relative humidity, and periodic winds, can result in frequent and potentially catastrophic fires. During the nearly year-round fire season, the dry vegetation and heat, and sometimes windy weather with an ignition source can result in an increase in fire. Any fire, once ignited, has the potential to quickly become large, and out-of-control. As development continues throughout the County and the District, especially in these interface areas, the risk and vulnerability to wildfires will likely increase.

Potential impacts from wildfire include loss of life and injury; damage to structures and other improvements, natural and cultural resources, croplands, and loss of recreational opportunities. Wildfires can cause short-term and long-term disruption to the District. Fires can have devastating effects on watersheds through the loss of vegetation and soil erosion, which may impact the District by changing runoff patterns, increasing sedimentation, reducing natural and reservoir water storage capacity, and degrading water quality. Fires can also affect air quality in the District; smoke and air pollution from wildfires can be a severe health hazard.

Although the physical damages and casualties arising from large fires may be severe, it is important to recognize that they also cause significant economic impacts by resulting in the loss of function of buildings and infrastructure. Economic impacts of the loss of transportation and utility services may include traffic delays/detours from road and bridge closures and loss of electric power, potable water, and wastewater services. Schools and businesses can be forced to close for extended periods of time. Recently, the threat of wildfire, combined with the potential for high winds, heat, and low humidity, has caused PG&E to initiate PSPSs which can also significantly impact a community through loss of services, business closures, and other impacts associated with loss of power for an extended period. More information on power shortage and failure can be found in the Severe Weather: Extreme Heat Section above, as well as in Section 4.3.2

of the Base Plan. In addition, catastrophic wildfire can create favorable conditions for other hazards such as flooding, landslides, and erosion during the rainy season.

The District noted the following impacts:

- With respect to wildfire smoke, in the last few years, the Sacramento area Air Districts have requested the U.S. EPA several times to determine an Exceptional Event finding for the Sacramento Region to exclude data from attainment emissions. Without these Exceptions, the County will most likely not be able to meet the PM standard by the U.S. EPA's deadline which could result in repercussions for the area.

Assets at Risk

The District assets most at risk due to increased wildfires would be the remote air quality monitoring stations and weather stations (RAWS), and to a lesser extent, the District's office in the City of Auburn.

Y.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

Y.6.1. Regulatory Mitigation Capabilities

Table Y-5 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the PCAPCD.

Table Y-5 PCAPCD Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan/General Plan		The District develops strategies and rules designed to decrease air pollutant emissions and improve air quality thereby moving the region toward attainment of state and federal ambient air quality standards. The proposed mitigation measures are consistent with the District's air quality improvement planning.
Capital Improvements Plan		
Economic Development Plan		
Local Emergency Operations Plan		
Continuity of Operations Plan		
Transportation Plan		
Stormwater Management Plan/Program		
Engineering Studies for Streams		

Community Wildfire Protection Plan		
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)		The District worked with other Sacramento local air districts to develop the Sacramento Wildfire Exceptional Event Mitigation Plan in 2018. The plan is developed to minimize the public exposure to PM2.5 generated from wildfire events.
Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code		Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score		Score:
Fire department ISO rating:		Rating:
Site plan review requirements		
		Is the ordinance an effective measure for reducing hazard impacts?
Land Use Planning and Ordinances	Y/N	Is the ordinance adequately administered and enforced?
Zoning ordinance		
Subdivision ordinance		
Floodplain ordinance		
Natural hazard specific ordinance (stormwater, steep slope, wildfire)		
Flood insurance rate maps		
Elevation Certificates		
Acquisition of land for open space and public recreation uses		
Erosion or sediment control program		
Other		
How can these capabilities be expanded and improved to reduce risk?		
Additional resources and funding for District operations and the proposed mitigation measures will help address impacts to public health due to Climate Change, Extreme Heat, and Wildfire (Smoke) impacts. Increased public education and outreach will better inform the public of potential health impacts due to these three hazards. More local, low-cost air sensors (ex. Purple Air) will allow the public to make informed decisions about daily activities during wildfire smoke events. Air purifying equipment at local Clean Air Centers during wildfire smoke events will provide a healthier environment especially for the low income community.		

Source: PCAPCD

Y.6.2. Administrative/Technical Mitigation Capabilities

Table Y-6 identifies the District department(s) responsible for activities related to mitigation and loss prevention in PCAPCD.

Table Y-6 PCAPCD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission		
Mitigation Planning Committee		

Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	The District periodically must clear the area around monitors and weather stations of vegetation. This is sometimes done in coordination with CAL FIRE and/or USFS.
Mutual aid agreements		
Other		
Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	N	
Floodplain Administrator	N	
Emergency Manager	N	
Community Planner	N	
Civil Engineer	N	
GIS Coordinator	N	
Other	Y	Deputy APCO, Associate Planner, Air Quality Specialist II, and Senior Air Quality Planner are trained in mitigation.
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	N	
Hazard data and information	N	
Grant writing	N	
Hazus analysis	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District will collaborate with the County/OES to utilize warning systems to inform the public if areas reach very unhealthy/hazardous and how to find a Clean Air Center.		

Source: PCAPCD

Y.6.3. Fiscal Mitigation Capabilities

Table Y-7 identifies financial tools or resources that the District could potentially use to help fund mitigation activities.

Table Y-7 PCAPCD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	N	
Authority to levy taxes for specific purposes	N	
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	N	
Storm water utility fee	N	

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Incur debt through general obligation bonds and/or special tax bonds	N	
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	Y	
State funding programs	Y	
Other		
How can these capabilities be expanded and improved to reduce risk?		
The District can identify and pursue State funding programs for Clean Air Centers.		

Source: PCAPCD

Y.6.4. Mitigation Education, Outreach, and Partnerships

Table Y-8 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table Y-8 PCAPCD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.		
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)		The District has produced various wildfire smoke safety outreach materials, such as the outdoor smoke activity table for school day decision making developed with the County's Office of Education.
Natural disaster or safety related school programs		
StormReady certification		
Firewise Communities certification		
Public-private partnership initiatives addressing disaster-related issues		
Other		
How can these capabilities be expanded and improved to reduce risk?		
Develop and distribute wildfire smoke related materials to the public. Support wildfire smoke impact response, such as press releases, public education events, webpage based information, social media posts and brochures/flyers/pamphlets. This comment seems like it is a county comment and not for our annex specifically if we are talking our infrastructure.		

Source: PCAPCD

Y.6.5. Other Mitigation Efforts

The District has many other completed or ongoing mitigation efforts that include the following:

Climate Change: This issue area is not a distinct and separate hazard but rather exacerbates the two hazards below.

Extreme Heat: The District participates in the regional “Spare the Air” program, which is a service alerting the public during time of unhealthy air quality both during the summer (ozone) and winter (particulate matter). The District also performs its own public education and outreach concerning the hazards of unhealthy air quality and ways to minimize air pollutant emissions around open burning, and other combustion activities. The District has a robust grants and incentives program to reduce air pollutant emissions by replacing dirty pieces of equipment and vehicles with cleaner equipment/vehicles, offering incentives to changeout high-polluting wood stoves with cleaner heating devices, installing zero emission fueling infrastructure, and incentivizing the purchase of electric passenger vehicles.

Wildfire (smoke): The District has previously purchased and installed low-cost Purple Air sensors for particulate matter and placed them strategically throughout the County in areas not covered our five regulatory air quality monitoring sites. These sensors give the public a real-time method of assessing air quality related to wildfire smoke. Additionally, the District has purchased temporary EBAM monitors which are technology more closely related to our regulatory monitors that can be deployed during wildfire smoke events for a higher level of accuracy.

The District has funded wood chipping programs through our Clean Air Grants (CAG) that provide a no or low-cost service to County residents to dispose of woody debris and create defensible space around structures. Several fire engines have been funded by the CAG as well. The District has also supported biomass to energy projects which remove woody fuel from the forests and convert it to electricity primarily through combustion to heat water, creating steam and turning steam generators.

Finally, the local air districts in the Sacramento region collaborated to prepare the “Wildfire Mitigation Plan for the Sacramento Federal Nonattainment Area for PM 2.5” in 2018. This plan was developed to minimize public exposure to the impacts of PM2.5 during wildfire events. The plan outlines the procedures the air districts should take to protect public health due to increases in PM concentrations from wildfires.

Y.7 Mitigation Strategy

Y.7.1. Mitigation Goals and Objectives

The PCAPCD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

Y.7.2. Mitigation Actions

The planning team for the PCAPCD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and

administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included. The following hazards were considered a priority for purposes of mitigation action planning:

- Climate Change
- Severe Weather: Extreme Heat
- Wildfire (smoke)

It should be noted that many of the projects submitted by each jurisdiction in Table 5-4 in the Base Plan benefit all jurisdictions whether or not they are the lead agency. Further, many of these mitigation efforts are collaborative efforts among multiple local, state, and federal agencies. In addition, the countywide public outreach action, as well as many of the emergency services actions, apply to all hazards regardless of hazard priority. Collectively, this multi-jurisdictional mitigation strategy includes only those actions and projects which reflect the actual priorities and capacity of each jurisdiction to implement over the next 5-years covered by this plan. It should further be noted, that although a jurisdiction may not have specific projects identified for each priority hazard for the five year coverage of this planning process, each jurisdiction has focused on identifying those projects which are realistic and reasonable for them to implement and would like to preserve their hazard priorities should future projects be identified where the implementing jurisdiction has the future capacity to implement.

Multi-Hazard Actions

Action 1. Air Quality Public Education & Outreach

Hazards Addressed: Wildfire Smoke Air Quality Impacts / Extreme Heat / Climate Change

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: General public knowledge about air quality, its effects on health, and ways to improve it, is low. Wildfire smoke events continue to be frequent, especially in areas that are not fully fire resilient such as northern California's mountainous counties like Placer County. Additionally, extreme heat events brought on by climate change greatly increase local ozone concentrations, leading to public health impacts. It is critical for the public to understand how wildfire smoke and extreme heat impact their health, how to identify poor air quality, and steps they can take to minimize their exposure.

Project Description: Develop and distribute wildfire smoke, extreme heat, and climate change related materials to the public. Support wildfire smoke impact response, and extreme heat events, such as press releases, public education events, webpage-based information, social media posts and brochures/flyers/pamphlets/fact sheets.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Placer County Air Pollution Control District (PCAPCD) staff have the experience and knowledge to provide public education and outreach on wildfire smoke impacts and extreme heat event impacts. PCAPCD staff can provide labor for this project.

Responsible Agency/ Department/Partners: Placer County Air Pollution Control District

Cost Estimate: \$100,000

Benefits (Losses Avoided): Increased Public Education and Outreach before and during wildfire incidents and extreme heat events to provide health-based information to the public so they can take steps to protect their health.

Potential Funding: Local, state, and federal grant sources.

Timeline: Immediate

Project Priority (H, M, L): High

Action 2. Local Air Quality Sensors to provide instantaneous public information on local PM concentrations due to wildfire smoke.

Hazards Addressed: Wildfire Smoke Air Quality Impacts / Extreme Heat / Climate Change

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: During the increasing number of acres burned during wildfire events along with the ensuing wildfire smoke (especially in times of extreme heat), the local air quality is greatly impacted with many hours to days with health based air quality standards exceeded. While there is a county-wide network (five total) of sophisticated PM air quality monitors, these are primarily used to monitor regulatory compliance with state and federal Ambient Air Quality Standards (AAQS), take measurements averaged over long periods of time, and do not provide instant “real-time” data for which to make quicker decisions affecting public health. Air quality sensors have become increasingly helpful to provide excellent indicators on widespread smoke and fairly accurate data that is vital for making immediate decisions concerning outdoor activities especially when wildfire smoke levels fluctuate greatly within just a few minutes to hours. The existing PM monitoring network for regulatory purposes cannot provide this localized, neighborhood timely information.

Project Description: This project would purchase and deploy throughout the county low-cost, local air quality sensors that instantaneously measure PM levels. Typically, this information is instantaneously uploaded to a website where anyone can view current and recent past readings of PM concentration. Various thresholds of concentrations are indicated allowing the viewer to determine if it is safe for them to spend time outdoors. Many groups, such as schools and outdoor sports leagues, use this information to determine the level and intensity of outdoor activities right before commencing.

Other Alternatives: Relying on existing regulatory PM air quality monitors, of which there are only 5 in the county, and which do not publicly provide real-time local PM concentrations.

Existing Planning Mechanism(s) through which Action Will Be Implemented: The Placer County Air Pollution Control District (PCAPCD) has experience deploying and installing these types of sensors and would provide personnel to install these units.

Responsible Agency/ Department/Partners: Placer County Air Pollution Control District, in partnership with Placer County and Health and Human Services.

Cost Estimate: Approximately \$250-300 per sensor

Benefits (Losses Avoided): These sensors provide the public no-cost, instantaneous PM concentrations in the vicinity of the sensor via a publicly accessible website in order to help make informed, real-time decisions about their level of outdoor activity to protect the public health.

Potential Funding: \$50,000 to provide 165-200 PM air quality sensors will be sought from state, local, and federal sources.

Timeline: Immediate to be prepared for the next wildfire smoke event

Project Priority (H, M, L): High

Action 3. Wildfire Smoke Impact Response – Clean Air Centers for Vulnerable Populations

Hazards Addressed: Wildfire Smoke Air Quality Impacts / Extreme Heat / Climate Change

Goals Addressed: 1, 2, 3, 4, 5, 6, 7

Issue/Background: During the increasing number of acres burned during wildfire events and the ensuing wildfire smoke, local air quality is greatly impacted, with air quality concentrations qualified with the U.S. EPA’s air quality index (AQI) reaching high levels in the very unhealthy and hazardous levels. These high levels of smoke increase health effects for everyone especially for those with more serious health effects in vulnerable populations including children, elderly, and those with health conditions. Placer County residents were exposed to 40+ days of heavy smoke in 2020.

Project Description: Establish Clean Air Centers to help those most affected by wildfire smoke impacts. The Centers will provide enhanced air filtration at facilities in communities with vulnerable populations in Auburn, Kings Beach, Lincoln, Rocklin and Roseville, recognizing that unhealthy air disproportionately impacts children and elderly populations, people with pre-existing health problems, and low-income communities. The Clean Air Centers will be equipped with portable, high performance ultra-fine particulate matter (PM2.5) air filtration units. Portable units will provide the Placer County Air Pollution Control District (PCAPCD) and regional emergency management authorities and disaster response agencies the flexibility to address smoke impacts anywhere in the county. Covered costs would include staffing at both portable sites and permanent ones (Roseville High School and Placer High School).

Other Alternatives: Increased impacts on the healthcare system to treat those seriously impacted by smoke inhalation. Purchase of high quality ultra-fine-particulate matter air filters for individual residences.

Existing Planning Mechanism(s) through which Action Will Be Implemented: PCAPCD staff have the experience and knowledge to coordinate the purchase and installation of enhanced air filtration systems. In addition, PCAPCD is equipped to provide localized air quality data, advisories and alerts including

health-based information on wildfire smoke and its impacts so the public can take appropriate action to protect their health. PCAPCD staff can provide labor for this project.

Responsible Agency/ Department/Partners: PCAPCD in collaboration with Placer County Health and Human Services and partnering facilities (schools, community, sports, veteran and senior centers, fairgrounds, and libraries).

Cost Estimate: \$100,000 (7 portable units and replacement filters)

Benefits (Losses Avoided): Decreased health impacts and serious health impacts to vulnerable populations

Potential Funding: Local, state, and federal funding sources will be sought.

Timeline: Immediate to be prepared for the next wildfire smoke event

Project Priority (H, M, L): High

Appendix A Planning Process

A.1 Placer County Step 1: Organize to Prepare a Plan

(a). *Involvement of Community Land Use and Comprehensive Planning*

In addition to attending meetings, providing draft text for inclusion in the plan, reviewing plan documents, and coordinating input from other departments and stakeholders, Placer County planners also provided information on development since the last plan, mapping and details on future development areas, input on current mitigation capabilities, coordination with other planning mechanisms, and input on capabilities including in-progress modifications to various County plans, ordinances, and associated documents specific to Placer County’s floodplain management program.

Placer County Planners

- Angel Green, Senior Planner, Planning Services Division, Placer County Community Development Resource Agency

Other planners to the process included Jeanine Foster and Chris Morrison, professional planners with Foster Morrison, the consultant for this LHMP Update, as well as other planners and staff from the incorporated communities and other participating jurisdictions involved in future land use development decisions for the Placer County Planning Area.

(b). *Staff of County Departments on HMPC with Expertise on CRS Step 7 Activities*

In order to promote the integration of CRS into this planning process, the representatives from the County were selected based on their areas of expertise relative to the CRS mitigation categories as detailed in Table A-1.

Table A-1 Placer County Staff Capability with Six Mitigation Categories

Jurisdiction/Departments	Prevention	Property Protection	Natural Resource Protection	Emergency Services	Structural Flood Control Projects	Public Information	Other

(c) Placer County Resolution formally recognizing and establishing the planning process/planning committee

Placer County put together a formal resolution early in the planning process for the establishment of a planning committee. This resolution can be seen below.

**Before the Board of Supervisors
County of Placer, State of California**

Resolution No.: 2021-028

In the matter of: A resolution establishing a Hazard Mitigation Planning Committee and Hazard Mitigation Planning Subcommittee for the update of the Placer County Local Hazard Mitigation Plan

The following Resolution was duly passed by the Board of Supervisors of the County of Placer at a regular meeting held on February 16, 2021, by the following vote:

Ayes: GORE, WEYGANDT, HOLMES, JONES, GUSTAFSON

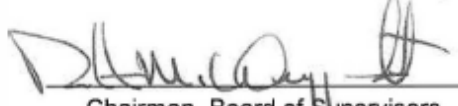

Noes: NONE

Absent: NONE

THE FOREGOING INSTRUMENT IS A CORRECT COPY OF THE ORIGINAL ON FILE IN THIS OFFICE
ATTEST

MEGAN WOOD
Clerk of the Board of Supervisors, County of Placer, State of California

Deputy Clerk

Signed and approved by me after its passage.

Chairman, Board of Supervisors

Attest:

Clerk of said Board

WHEREAS, Placer County is required to do hazard mitigation planning pursuant to the Robert T Stafford Disaster Mitigation Act of 2000 (DMA 2000) and for continued eligibility for certain sources of Federal Emergency Management Agency (FEMA) mitigation funding programs; and

WHEREAS, Placer County participates in The National Flood Insurance Program's (NFIP) Community Rating System (CRS); and

WHEREAS, the CRS Program also requires the County to adopt a Local Hazard Mitigation Plan (LHMP) with a Floodplain Management Plan component; and

WHEREAS, FEMA encourages combining the LHMP and CRS planning efforts into a single, coordinated plan; and

WHEREAS, to combine both program's efforts and meet the requirements of the LHMP and CRS Activity 510, it is necessary to establish a Hazard Mitigation Planning Committee (HMPC) and Hazard Mitigation Planning Subcommittee (HMP Subcommittee); and

WHEREAS, collectively, the HMPC and HMP Subcommittee will meet to fulfill the obligations of FEMA's DMA 2000 and the CRS Program Floodplain Management planning requirements through

organizing preparation of the LHMP update, involving the public, coordinating with other agencies, assessing the hazards, assessing problems, setting goals, reviewing possible activities, and assisting in the drafting of a mitigation action plan.

NOW, THEREFORE, BE IT RESOLVED BY THE BOARD OF SUPERVISORS OF THE COUNTY OF PLACER, that the Board takes the following actions:

1. Establish a Hazard Mitigation Planning Committee (HMPC) and authorize the County Executive Officer, or designee, to appoint County staff members to the HMPC; and
2. Approve the following criteria for representation on the HMPC:

HMPC Representation

a. County Departments

- i. Agricultural Commissioner
- ii. Assessor's Office
- iii. Community Development Resource Agency
- iv. Facilities Services
- v. Fire Service
- vi. Health and Human Services
- vii. Office of Emergency Services
- viii. Public Works
- ix. Risk Management
- x. Sheriff's Office

b. Incorporated communities

- xi. City of Auburn
- xii. City of Colfax
- xiii. City of Lincoln
- xiv. City of Rocklin
- xv. Town of Loomis

c. Other participating organizations to include special districts and others seeking FEMA approval of their respective annex in the LHMP.

d. Other private citizens, members of the public, and stakeholders including local, regional, state, and federal agencies and partners identified by the Placer County Office of Emergency Services.

3. Establish a Hazard Mitigation Planning Subcommittee comprised of three (3) members of the public appointed by the County Executive Officer, or designee, and the three (3) County staff members of the HMPC from the Community Development Resource Agency, the Department of Public Works, and the Office of Emergency Services.
4. This resolution shall take effect immediately.

Subject: Placer County Local Hazard Mitigation Plan Update Project - Hazard Mitigation Planning Committee Kickoff Meeting Invite

When: Wednesday, October 28, 2020 1:30 PM-4:00 PM (UTC-08:00) Pacific Time (US & Canada).

Where: Zoom Platform -

<https://us02web.zoom.us/j/81109100563?pwd=K1lmSzdzcDd4YjZtc2NxNUdvWnJ3dz09>; Meeting ID: 811 0910 0563; Passcode: 479633; Or call in: +1 669 900 6833 US (San Jose)

Greetings,

Placer County is kicking off efforts to develop a Local Hazard Mitigation Plan (LHMP) Update to the 2016 LHMP. The purpose of the LHMP Update process is to help reduce the impacts of hazards to the citizens, property, and critical infrastructure in the County. The Disaster Mitigation Act of 2000 (DMA 2000) requires that local governments have a FEMA-approved LHMP in place in order to be eligible for certain pre- and post-disaster mitigation funding utilized to protect communities from future disaster-related losses. Another benefit of this LHMP Update is to enhance the floodplain management programs of the county and cities which can help reduce the costs of flood insurance to residents of Placer County through their participation in the National Flood Insurance Program's (NFIP) Community Rating System (CRS).

You are receiving this notice because we would like to invite you to take part in this plan update as a member of the Hazard Mitigation Planning Committee (HMPC). In addition to plan participation by Placer County Departments, Cities/Town, fire districts, special districts, and state and federal agencies, the public and other interested stakeholders are encouraged to attend and participate. For additional info on the make-up of HMPC and participating allied agencies and stakeholders, please see attachment.

Agency and community participation and coordination is a requirement of an approved Plan, as is the inclusion of any hazard data, information, and mitigation projects your organization may want to see included in the Plan. Thus, your participation in this process is important and encouraged. Your input will be critical to the success of this project. Participation includes:

- Attending and participating in the HMPC meetings (5 anticipated over the next 9 months)
- Providing available data/information requested of the HMPC
- Reviewing and providing comments on the plan drafts

Placer County Office of Emergency Services (OES) is taking the lead on coordinating the LHMP updating project working with hired consultant, Foster Morrison Consulting (FMC). A project kickoff meeting will be held at the following location and date/time:

Planning Committee Meeting: Virtual Meeting – Zoom Platform

October 28, 2020 (Wednesday)

1:30 – 4:00 pm

<https://us02web.zoom.us/j/81109100563?pwd=K1lmSzdzcDd4YjZtc2NxNUdvWnJ3dz09>

Meeting ID: 811 0910 0563

Passcode: 479633

Or call in: +1 669 900 6833 US (San Jose)

The kickoff meeting will explain the process and how you can be involved. A public stakeholder meeting will also be held the evening of the same day of the kickoff meeting via Zoom from 6:00 – 7:30 pm. We encourage the public to participate as part of the HMPC to help inform this LHMP Update.

For more information on this project, please visit: <https://www.placer.ca.gov/1381/Local-Hazard-Mitigation-Plan>

Please RSVP and plan on attending or delegating attendance to this important meeting. If you are not the point of contact for your organization or would like to include others from your staff to receive future invites or updates, please let me know. For additional information or if you have questions, please contact Young (Rod) Rodriguez at yrodrigu@placer.ca.gov or by calling at (530) 886-5316.

Subject: Placer County Local Hazard Mitigation Plan Update - Risk Assessment Meeting

When: Wednesday, February 3, 2021 1:30 PM-4:00 PM (UTC-08:00) Pacific Time (US & Canada).

Where: Zoom Platform -

<https://us02web.zoom.us/j/83106184231?pwd=RXRzdWhpKzFUOEpiSk5GeUVNbkh3UT09>; Or call in: +1 669.900.6833 (San Jose), Meeting ID: 831 0618 4231, Passcode: 216515

Placer County Hazard Mitigation Planning Committee:

You are invited to the HMPC Risk Assessment Meeting, our second planning committee meeting for the development of Placer County's Local Hazard Mitigation Plan (LHMP) Update. Many of you attended the planning committee kickoff meeting on October 28, 2020 which initiated the hazard mitigation planning effort, with support from Foster Morrison Consulting. Over the past couple of months, the Foster Morrison team has been working to collect data to develop Chapter 4 of our LHMP, the Risk Assessment Chapter, and for development of the Jurisdictional Annexes to the LHMP.

This Risk Assessment Meeting will be held via Zoom on Wednesday, February 3 from 1:30 – 4:00 pm. During this meeting, we will be reviewing the risk assessment data developed to date and will be looking for your feedback in refining and adding to this in-process Risk Assessment Chapter. We will also be discussing jurisdictional participation and data still needed to inform the risk assessment for the Placer County LHMP Update. Current information on the LHMP Update and dates and times of future meetings are locate at

<https://www.placer.ca.gov/1381/Local-Hazard-Mitigation-Plan>

Join Zoom Meeting

Subject: Placer County LHMP Update: Mitigation Strategy Goal Meeting - Save the Date, 2/24/2021

When: Wednesday, February 24, 2021 2:00 PM-3:30 PM (UTC-08:00) Pacific Time (US & Canada).

Where: Zoom Meeting Link:

<https://us02web.zoom.us/j/81578188040?pwd=RE9rRnVKMFhKYXRHNGJCeTFpdnRxUT09>, Or call-in +1 669 900 6833, Meeting ID: 815 7818 8040, Passcode: 958595

Good afternoon,

First, thank you to those who attended last week's LHMP Risk Assessment Meeting and for all the great hazard input! Keep it coming – Remember we need hazard information specific to Placer County and each Participating Jurisdiction including hazard problem areas, past hazard occurrences since 2016, including impacts and damages and any unique vulnerability issues and impacts. Review the attached “Placer Risk Assessment Summary v020321” highlights for areas where additional information is needed.

Second, you are invited to the Mitigation Strategy Meetings (HMPC #3 & #4) for the 2021 Placer County LHMP Update. **[These are the two most important meetings for this LHMP Update.](#)**

Wednesday, February 24 (2:00 pm - 3:30 pm) - Mitigation Strategy Goal Meeting –

During this first meeting, we will be providing an overview of the LHMP Update Project and defining Next Steps. We will also be updating LHMP goals and objectives from the 2016 LHMP.

Zoom Meeting

Link: <https://us02web.zoom.us/j/81578188040?pwd=RE9rRnVKMFhKYXRHNGJCeTFpdnRxUT09>

Meeting ID: 815 7818 8040

Passcode: 958595

One tap mobile

+16699006833,81578188040#, *958595# US (San Jose)

Tuesday, March 2 (2:00 pm – 4:30 pm) - Mitigation Strategy Actions/Projects Meeting –

During this second meeting, we will be working to identify and evaluate potential mitigation actions and projects for reducing Placer County's and all Participating Jurisdiction's risk and vulnerability to priority hazards and disasters.

****Please make sure everyone that has mitigation projects to include in the LHMP Update for all identified priority hazards attends – All Participating Jurisdictions and their key staff, with knowledge or input on mitigation actions and projects, need to be present****

***Attached is the “Goals and Actions from the 2016 LHMP” for reference – this is what we are updating and adding to!

Zoom Meeting

Link: <https://us02web.zoom.us/j/81003262326?pwd=RDE3cUx0aY5b0V1bTQyS09UK1RYQT09>

Meeting ID: 810 0326 2326

Passcode: 922171

One tap mobile

+16699006833, 81003262326, *922171# US (San Jose)

Information for both meetings and attachments will also be posted on the County website at <https://www.placer.ca.gov/1381/Local-Hazard-Mitigation-Plan>

County and agency participation and coordination is a requirement of an approved LHMP, as is the inclusion of any hazard data, information, and mitigation projects your department or agency may want to see included in the plan. Your continued participation and input is critical to the success of this project.

Attachments:

- **FEMA Mitigation Ideas:** This reference document will provide mitigation projects ideas. Highly encourage all participants to review. What fits for Placer County?
- **Goals and Actions from the 2016 LHMP:** Will be reviewed during the meeting March 2nd
- **Placer Mitigation Action Worksheet:** This will need to be completed for each mitigation project/action to be included in the Plan Update, whether they are new or are being carried forward from the 2016 project list.
- **Placer Risk Assessment Summary v020321:** for reference and additional hazard risk information

Please let me know if you have questions. Thank you.

Mitigation Strategy Meeting Agenda

Placer County Local Hazard Mitigation Plan (LHMP) Update Mitigation Strategy Meetings February 24th and March 2nd, 2021

HMPC Meeting #2:

1. Introductions
2. LHMP Project Status and Next Steps/Timeline
3. Priority Hazards Review
4. Develop Plan Goals and Objectives
5. Introduction to HMPC Meeting #4: Mitigation Alternatives/Actions/Projects

HMPC Meeting #3:

1. Introductions
2. Review Mitigation Categories and Selection Criteria
3. Brainstorming of Mitigation Alternatives/Actions/Projects by Hazard
4. Review of Voting Process for Prioritization of Mitigation Projects
5. Questions

Mitigation Strategy Meeting Sign in Sheets – February 24th

Name/Title	Department/Agency/Affiliation
Jeff Ingolia	South Placer Fire District
Scott Alcantara	San Juan Water District
Brandon Burks	Olympic Valley Public Services District
Rod Rodriguez	Placer County OES

A.2 Placer County Step 2: Involve the Public

Multiple efforts were made to engage the public during the creation of this plan, including direct outreach efforts such as phone calls, emails, direct mailings, and face-to-face meetings, in addition to the broader outreach efforts such as e-newsletters, website postings, newspaper advertisements and articles, and leveraging other community events to communicate and invite participation in the LHMP Update project. A key element of public participation is including members of the public and other public-type stakeholders (at 50% participation) on the Hazard Mitigation Planning Committee.

a) List of Hazard Mitigation Planning Committee (HMPC) Members

The HMPC, comprising key county, city, special district, and other government and stakeholder representatives and the public, developed the plan with leadership from the County OES and facilitation by Foster Morrison. The non-local government members of the Steering Committee (citizens and other outside stakeholders) represent more than 50% representation of the committee.

This list of HMPC members is shown in Section A.1.c of this Appendix.

b) and c) Public Meetings

In addition to advertisement and newspaper article for public participation, notices of meetings were sent directly to all persons on the HMPC contact list and also to other agency and key stakeholders with an interest in the Placer County Planning Area. The majority of these people reside in Placer County or in surrounding communities. The formal public meetings for this project are summarized in the following table.

Meeting Type	Meeting Topic	Meeting Date	Meeting Locations
Early Public Meeting	1) Intro to DMA, CRS and mitigation planning 2) 2021 LHMP Update Process	October 28, 2020	Zoom Meeting
Final Public Meeting	1) Presentation of Draft LHMP and solicitation of public and stakeholder comments	June 9, 2021	Zoom Meeting

Article Advertising Early Public Meeting

The screenshot shows a news article on the Roseville Today website. The article title is "PLACER COUNTY SEEKS COMMUNITY FEEDBACK FOR LOCAL HAZARD MITIGATION PLAN UPDATE". The sub-headline is "LONG-TERM STRATEGY TO REDUCE DISASTER LOSSES". The article is dated October 13, 2020, and is written by Staff. The article text discusses Placer County's efforts to update its local hazard mitigation plan, mentioning a partnership with cities and special districts to assess risks from floods, drought, wildfires, and severe weather. It also notes that a FEMA-approved plan allows for pre- and post-disaster mitigation grant funding, which can lead to lower flood insurance premiums. The website interface includes a navigation menu, social media sharing options, and a sidebar with "Upcoming Events" and "Around California" sections.

PLACER COUNTY SEEKS COMMUNITY FEEDBACK FOR LOCAL HAZARD MITIGATION PLAN UPDATE

Staff · October 13, 2020

Share

LONG-TERM STRATEGY TO REDUCE DISASTER LOSSES

COUNTY OF Placer

AUBURN, Calif – Placer County is seeking community feedback to update its local hazard mitigation plan.

The plan, a partnership with cities and special districts, assesses the risk of floods, drought, wildfires, severe weather, and other natural hazards of concern to the county. While hazards are not always preventable, a hazard mitigation plan establishes the foundation for a long-term community strategy to reduce disaster losses, while also making Federal Emergency Management Agency resources available upon plan approval.

A FEMA-approved hazard mitigation plan allows agencies to apply for pre- and post-disaster mitigation grant funding. It can also increase community ratings used for the National Flood Insurance Program, which can result in lower flood insurance premiums through the program.

Placer County is seeking community feedback for their 2021 local hazard mitigation plan update

Published Oct. 8, 2020

Placer County is seeking community feedback to update its local hazard mitigation plan.

The plan, a partnership with cities and special districts, assesses the risk of floods, drought, wildfires, severe weather, and other natural hazards of concern to the county. While hazards are not always preventable, a hazard mitigation plan establishes the foundation for a long-term community strategy to reduce disaster losses, while also making Federal Emergency Management Agency resources available upon plan approval.

A FEMA-approved hazard mitigation plan allows agencies to apply for pre- and post-disaster mitigation grant funding. It can also increase community ratings used for the National Flood Insurance Program, which can result in lower flood insurance premiums through the program.

Placer County is seeking members of the public to participate on the hazard mitigation planning committee for this plan update. Background experience on the issue is not required. Placer County is requesting attendance and participation from the community at the upcoming planning committee and public meetings to kick off the project.

Early Public Meeting Press Release

Placer County 2021 Local Hazard Mitigation Plan Update

HELP YOUR COMMUNITY BE HAZARD-READY!

Placer County with its cities and numerous special districts will be updating their 2016 Local Hazard Mitigation Plan (LHMP) looking at the risk of floods, drought, wildfires, severe weather, and other natural hazards of concern to the County. While hazards such as these cannot be prevented, a Hazard Mitigation Plan forms the foundation for a community's long-term strategy to reduce disaster losses. A FEMA-approved Hazard Mitigation Plan allows agencies to apply for pre- and post-disaster mitigation grant funding. In addition, this LHMP Update provides for lower costs of flood insurance premiums to residents of Placer County through the National Flood Insurance Program's (NFIP) Community Rating System (CRS).

You are invited. Placer County is seeking members of the public to participate on our Hazard Mitigation Planning Committee (HMPC) for this LHMP Update. No background or expertise is required. We encourage attendance and participation from the general public at our upcoming Planning Committee and Public Meetings to kick off the project; please select the time and location that works best for you:

Planning Committee Virtual Meeting
October 28, 2020 (Wednesday)

###

Early Public Meeting Article

The screenshot shows a news article on the Roseville Today website. The article is titled "PLACER COUNTY SEEKS COMMUNITY FEEDBACK FOR LOCAL HAZARD MITIGATION PLAN UPDATE" and is dated October 13, 2020. The article features a sub-headline "LONG-TERM STRATEGY TO REDUCE DISASTER LOSSES" and a Placer County logo. The main text discusses the county's plan to seek community feedback to update its local hazard mitigation plan, which assesses risks from floods, drought, wildfires, and severe weather. It also mentions that a FEMA-approved plan allows for pre- and post-disaster mitigation grant funding. The article includes social media sharing options and a "View Calendar" link. The website header includes navigation links for Home, Local News, Yellow Pages, Advertise, Travel, Columns, Events, and Music. The date "Tuesday, May 18, 2021" is displayed in the top right corner.

LONG-TERM STRATEGY TO REDUCE DISASTER LOSSES

COUNTY OF Placer

AUBURN, Calif – Placer County is seeking community feedback to update its local hazard mitigation plan.

The plan, a partnership with cities and special districts, assesses the risk of floods, drought, wildfires, severe weather, and other natural hazards of concern to the county. While hazards are not always preventable, a hazard mitigation plan establishes the foundation for a long-term community strategy to reduce disaster losses, while also making Federal Emergency Management Agency resources available upon plan approval.

A FEMA-approved hazard mitigation plan allows agencies to apply for pre- and post-disaster mitigation grant funding. It can also increase community ratings used for the National Flood Insurance Program, which can result in lower flood insurance premiums through the program.

Last chance to give YOUR feedback on emergency plans!

This is the final week to give feedback on emergency planning efforts in Placer County! Our Local Hazard Mitigation Plan is now live for your review and will be receiving feedback at community meetings June 9 and June 10. Also, this is the last week to take our Community Wildfire Preparedness Plan survey. Together we can make sure our county is emergency prepared! [View the LHMP plan](#) and [take the CWPP survey today](#)

Help Reduce Disaster Losses in Your Community! **We need your participation in the** **Placer County Local Hazard Mitigation Plan Update**

Placer County is partnering with their incorporated communities and several special districts to develop a Local Hazard Mitigation Plan (LHMP) Update to their 2016 plan. The purpose of this LHMP Update is to assess community risk and vulnerability to identified hazards, implement actions to reduce future losses, and maintain eligibility for federal mitigation funds in accordance with the Disaster Mitigation Act of 2000.

What is Hazard Mitigation?

Hazard mitigation means any action taken to reduce or eliminate the long-term risk to human life and property from natural hazards.

Why is Natural Hazard Mitigation Important?

Most people who live or work in Placer County have been affected by natural hazards in one way or another. Placer County and its residents are vulnerable to a variety of hazards including floods, drought, wildfire, earthquake, and a variety of other severe weather events.

The rising costs associated with disaster response and recovery have focused the attention of federal, state, and local governments on addressing natural hazards before they occur. Obviously, torrential rains and floods cannot always be prevented from occurring. Planning for natural hazards and implementing mitigation measures, however, can reduce the impact of such events when they do occur. Emergency response and recovery costs; property damage; personal injury and loss of life; and the overall economic and social impact on the community can all be reduced, and in some instances eliminated through natural hazard mitigation.

Hazard Mitigation Plan and Plan Update Process

Utilizing a FEMA grant, Placer County is developing an update to their 2016 LHMP. This LHMP Update is being developed by a Hazard Mitigation Planning Committee comprised of representatives from the County, Cities, neighboring jurisdictions, federal, state, and local agency stakeholders, and the public.

The plan will address an updated list of hazards, will assess the likely impacts of these hazards to the people and assets of the Placer County Planning Area, and will also establish updated goals and prioritize projects to reduce the impacts of future disasters on people and property as well as to critical facilities and infrastructure.

Another benefit of mitigation planning is that it can also help lessen the cost of flood insurance to the residents of Placer County through FEMA’s National Flood Insurance Program’s (NFIP) Community Rating System.

National Flood Insurance Program’s Community Rating System

The NFIP’s Community Rating System (CRS) is a voluntary incentive program that recognizes and encourages community floodplain management activities that exceed the minimum NFIP requirements. As a result, flood insurance premium rates are discounted to reflect the reduced flood risk resulting from the community actions in meeting the goals of the CRS Program. The reduction in flood insurance premium rates is provided according to a community’s CRS classification. Placer County is currently a CRS Class 5, which provides for a 25 percent discount on flood insurance to those located within the special flood hazard area (SFHA) and a 10 percent discount to those located in non-SFHA areas.

Opportunities for Input

Members of the community have a very important role in this process.

Draft LHMP Documents

A draft of the LHMP Update is available for review and comment by the public and all interested stakeholders on the County website at: <https://www.placer.ca.gov/1381/Local-Hazard-Mitigation-Plan> and hard copies placed in the following locations: **INSERT**.

All comments on the Public Review Draft should be submitted to jeanine.foster@fostermorrison.com.

Final Public Meeting Press Release

Press Release

Placer County Invites Comments on their 2021 Local Hazard Mitigation Plan Update!

HELP YOUR COMMUNITY BE HAZARD-READY!

Placer County, CA: Placer County is partnering with its five incorporated communities and several special districts to develop an update their 2016 Local Hazard Mitigation Plan (LHMP). Floods, drought, wildfires, and severe weather are just a few of the hazards of concern to the Placer County Planning Area. While natural hazards such as these cannot be prevented, an LHMP forms the foundation for a community's long-term strategy to reduce disaster losses by breaking the repeated cycle of disaster damage and reconstruction. Additionally, communities with a FEMA-approved LHMP are eligible to apply for both pre- and post-disaster mitigation grant funding and for lower costs of flood insurance to residents through the National Flood Insurance Program's (NFIP) Community Rating System (CRS).

The process began in November 2020 with an initial planning and public meeting and the establishment of a Hazard Mitigation Planning Committee (HMPC) comprised of representatives from the County, incorporated communities, special districts, other key stakeholders, and the public. The 2021 LHMP Update is scheduled to be finalized and submitted to Cal OES and FEMA in June 2021.

Public Review Draft

The Public Review Draft of the 2021 LHMP Update is available online (pdf format) at: <https://www.placer.ca.gov/1381/Local-Hazard-Mitigation-Plan>. It is also available (in printed copy) at the following Placer County locations:

- Placer County Public Library Main Branch
- ???

Public and Planning Committee Meetings

We encourage attendance and participation from the general public at our upcoming public and planning committee meetings on the Draft LHMP. Please select the time and location that works best for you:

Placer County is seeking community feedback for their 2021 local hazard mitigation plan update. Hello!

Placer County is seeking community feedback to update its local hazard mitigation plan.

The plan, a partnership with cities and special districts, assesses the risk of floods, drought, wildfires, severe weather, and other natural hazards of concern to the county. While hazards are not always preventable, a hazard mitigation plan establishes the foundation for a long-term community strategy to reduce disaster losses, while also making Federal Emergency Management Agency resources available upon plan approval.

A FEMA-approved hazard mitigation plan allows agencies to apply for pre- and post-disaster mitigation grant funding. It can also increase community ratings used for the National Flood Insurance Program, which can result in lower flood insurance premiums through the program.

Placer County is seeking members of the public to participate on the hazard mitigation planning committee for this plan update. Background experience on the issue is not required. Placer County is requesting attendance and participation from the community at the upcoming planning committee and public meetings to kick off the project.

Placer County seeks public feedback for local hazard mitigation plan update

 Stacey Adams Oct 27, 2020 5:00 AM

Placer County is inviting the public to provide feedback on the update of the 2016 local hazard mitigation plan.

According to the Federal Emergency Management Agency (FEMA) website, a mitigation plan minimizes the impact of disasters and is the key to breaking the cycle of disaster damage, reconstruction and repeated damage.

The county works with several allied local, state and federal agencies, such as Cal Fire, Caltrans, Parks and Recreation, CHP and the Bureau of Reclamation, to assess natural hazards that are of concern to the county and each agency, including wildfires, floods and severe weather. Throughout the process, a risk and vulnerability assessment will be completed and information from participating agencies will be reviewed and updated, according to Rod Rodriguez, Placer County emergency services coordinator.

The plan develops the foundation for a strategy to reduce disaster loss and makes FEMA resources available once a plan is approved. According to a county news release, a FEMA-approved plan allows agencies to apply for disaster mitigation funding, and can increase community ratings used for the National Flood Insurance Program, which can lower flood insurance premiums through the program.

The county will host two virtual meetings Wednesday, Oct. 28, for the project update:

Help Reduce Disaster Losses in Your Community! We need your participation in the Placer County Local Hazard Mitigation Plan Update

Placer County is partnering with their incorporated communities and several special districts to develop a Local Hazard Mitigation Plan (LHMP) Update to their 2016 plan. The purpose of this LHMP Update is to assess community risk and vulnerability to identified hazards, implement actions to reduce future losses, and maintain eligibility for federal mitigation funds in accordance with the Disaster Mitigation Act of 2000.

What is Hazard Mitigation?

Hazard mitigation means any action taken to reduce or eliminate the long-term risk to human life and property from natural hazards.

Why is Natural Hazard Mitigation Important?

Most people who live or work in Placer County have been affected by natural hazards in one way or another. Placer County and its residents are vulnerable to a variety of hazards including floods, drought, wildfire, earthquake, and a variety of other severe weather events.

The rising costs associated with disaster response and recovery have focused the attention of federal, state, and local governments on addressing natural hazards before they occur. Obviously, torrential rains and floods cannot always be prevented from occurring. Planning for natural hazards and implementing mitigation measures, however, can reduce the impact of such events when they do occur. Emergency response and recovery costs; property damage; personal injury and loss of life; and the overall economic and social impact on the community can all be reduced, and in some instances eliminated through natural hazard mitigation.

Hazard Mitigation Plan and Plan Update Process

Utilizing a FEMA grant, Placer County is developing an update to their 2016 LHMP. This LHMP Update is being developed by a Hazard Mitigation Planning Committee comprised of representatives from the County, Cities, neighboring jurisdictions, federal, state, and local agency stakeholders, and the public.

The plan will address an updated list of hazards, will assess the likely impacts of these hazards to the people and assets of the Placer County Planning Area, and will also establish updated goals and prioritize projects to reduce the impacts of future disasters on people and property as well as to critical facilities and infrastructure.

Another benefit of mitigation planning is that it can also help lessen the cost of flood insurance to the residents of Placer County through FEMA’s National Flood Insurance Program’s (NFIP) Community Rating System.

National Flood Insurance Program’s Community Rating System

The NFIP’s Community Rating System (CRS) is a voluntary incentive program that recognizes and encourages community floodplain management activities that exceed the minimum NFIP requirements. As a result, flood insurance premium rates are discounted to reflect the reduced flood risk resulting from the community actions in meeting the goals of the CRS Program. The reduction in flood insurance premium rates is provided according to a community’s CRS classification. Placer County is currently a CRS Class 5, which provides for a 25 percent discount on flood insurance to those located within the special flood hazard area (SFHA) and a 10 percent discount to those located in non-SFHA areas.

Opportunities for Input

Members of the community have a very important role in this process. Several planning team meetings will be held over the next eight months. A draft of the LHMP Update will be available Spring 2021 for review and comment by the public and all interested stakeholders on the County website and in select public libraries. Public meetings on the Draft Plan and final planning team meetings will also occur in early Summer 2021. All interested stakeholders and members of the public are encouraged to attend our planning team and public meetings.

LOCAL HAZARD MITIGATION PLAN

FEMA defines **Hazard Mitigation** as any action taken to reduce or eliminate the long-term risk to human life and property from identified hazards of concern.

Placer County is partnering with its Cities, Towns, fire districts, and several special districts to update the 2016 Local Hazard Mitigation Plan (LHMP). Wildfire, flood, severe weather, drought, and earthquake are just a few of the hazards to Placer County. While natural hazards such as these cannot be prevented, an LHMP forms the foundation for a community's long-term strategy to reduce disaster losses by breaking the repeated cycle of disaster damage and reconstruction.

Communities with a FEMA-approved LHMP are eligible for FEMA pre- and post-disaster grant funding and are better positioned to respond and recover when disasters occur. Through the LHMP development process, Placer County can also assist in lowering the costs of flood insurance premiums to county residents through participation in the National Flood Insurance Program's (NFIP) Community Rating System (CRS).

Nationwide, taxpayers annually pay billions of dollars helping communities, organizations, businesses and individuals recover from disaster. Some disasters are predictable and, in many cases, damage can be reduced or eliminated through hazard mitigation planning. The Federal Emergency Management Agency (FEMA) has targeted natural disaster loss reduction as one of its primary goals. Under the Disaster Mitigation Act of 2000, local jurisdictions are required to have a FEMA-approved Local Hazard Mitigation Plan (LHMP) to better position resources in advance of a disaster and to maintain eligibility for certain disaster assistance and hazard mitigation funding programs.

Placer County 2021 Local Hazard Mitigation Plan Update

Placer County is kicking off the LHMP Update process with meetings in October 2020. The plan will address an updated list of hazards, will assess the likely impacts of these hazards to the people and assets of the Placer County planning area, and will also establish updated goals and prioritize projects to reduce the impacts of future disasters on people and property as well as to critical facilities and infrastructure.

Opportunities for Input

Members of the community have a very important role in this process. A draft of the 2021 LHMP Update will be available on this website in Spring 2021 for review and comment by the public and all interested stakeholders.

Planning Committee and public meetings will also be held as part of the plan development process. In addition to plan participation by Placer County departments, cities, towns, fire districts, special districts, state and federal agencies, the public, and other interested stakeholders are encouraged to attend and participate in either Planning Committee or public meetings. Information on specific meeting times and locations are detailed below.

You may also provide your input by participating in [this survey](#).

Select Language

Survey

An integral element in hazard mitigation planning is broad public participation. Information provided by residents fosters a better understanding of local hazard concerns and can spawn innovative ideas to reduce impacts of future hazard events. A public opinion survey was accomplished to gather information from Placer County Planning Area residents concerning local hazards. The survey was located on the County's LHMP website and survey participation was promoted through public meetings, program websites, press

releases, social media, and other public outreach events as previously described. Following is a summary of survey results.

- 231 individuals took the survey.
- 122 out of the 231 people who responded were extremely concerned about the possibility of the community being affected by a disaster.
- Wildfire, drought, and climate change were hazards of greatest concern.
- 3 out of 231 respondents noted that their house was in a floodplain, 61 out of 231 did not know if their home was in a floodplain.
- 201 of the 231 respondents do not have flood insurance, while 13 of them do.
- 78 out of 231 stated that communities are not doing enough to inform the public about hazards affecting the County, while 65 of the 231 stated the community was doing a good job. 85 did not know or had no opinion.
- Of the 231 respondents, 25 felt unprepared, 157 felt somewhat prepared, and 44 felt well prepared for a natural disaster.
- Email, direct mailings, social media, and the County website were the best choices to reach the public regarding disaster information and making homes more disaster resistant.

Help Reduce Disaster Losses in Your Community! **We need your participation in the** **Placer County Local Hazard Mitigation Plan Update**

Placer County is partnering with their incorporated communities and several special districts to develop a Local Hazard Mitigation Plan (LHMP) Update to their 2016 plan. The purpose of this LHMP Update is to assess community risk and vulnerability to identified hazards, implement actions to reduce future losses, and maintain eligibility for federal mitigation funds in accordance with the Disaster Mitigation Act of 2000.

What is Hazard Mitigation?

Hazard mitigation means any action taken to reduce or eliminate the long-term risk to human life and property from natural hazards.

Why is Natural Hazard Mitigation Important?

Most people who live or work in Placer County have been affected by natural hazards in one way or another. Placer County and its residents are vulnerable to a variety of hazards including floods, drought, wildfire, earthquake, and a variety of other severe weather events.

The rising costs associated with disaster response and recovery have focused the attention of federal, state, and local governments on addressing natural hazards before they occur. Obviously, torrential rains and floods cannot always be prevented from occurring. Planning for natural hazards and implementing mitigation measures, however, can reduce the impact of such events when they do occur. Emergency response and recovery costs; property damage; personal injury and loss of life; and the overall economic and social impact on the community can all be reduced, and in some instances eliminated through natural hazard mitigation.

Hazard Mitigation Plan and Plan Update Process

Utilizing a FEMA grant, Placer County is developing an update to their 2016 LHMP. This LHMP Update is being developed by a Hazard Mitigation Planning Committee comprised of representatives from the County, Cities, neighboring jurisdictions, federal, state, and local agency stakeholders, and the public.

The plan will address an updated list of hazards, will assess the likely impacts of these hazards to the people and assets of the Placer County Planning Area, and will also establish updated goals and prioritize projects to reduce the impacts of future disasters on people and property as well as to critical facilities and infrastructure.

Another benefit of mitigation planning is that it can also help lessen the cost of flood insurance to the residents of Placer County through FEMA’s National Flood Insurance Program’s (NFIP) Community Rating System.

National Flood Insurance Program’s Community Rating System

The NFIP’s Community Rating System (CRS) is a voluntary incentive program that recognizes and encourages community floodplain management activities that exceed the minimum NFIP requirements. As a result, flood insurance premium rates are discounted to reflect the reduced flood risk resulting from the community actions in meeting the goals of the CRS Program. The reduction in flood insurance premium rates is provided according to a community’s CRS classification. Placer County is currently a CRS Class 5, which provides for a 25 percent discount on flood insurance to those located within the special flood hazard area (SFHA) and a 10 percent discount to those located in non-SFHA areas.

Opportunities for Input

Members of the community have a very important role in this process.

Draft LHMP Documents

A draft of the LHMP Update is available for review and comment by the public and all interested stakeholders on the County website at: <https://www.placer.ca.gov/1381/Local-Hazard-Mitigation-Plan> and hard copies placed in the following locations: **INSERT**.

All comments on the Public Review Draft should be submitted to jeanine.foster@fostermorrison.com.

Placer County reviews wildfire preparedness, mitigation; inmate crews 'decimated'

Chief: Inmate program has been 'decimated' across state

Stacey Adams May 28, 2021 12:00 PM

The Placer County Board of Supervisors received a presentation Tuesday of the county's efforts regarding wildfire preparedness and mitigation.

"Last year was a record year," said Brian Estes, CAL FIRE/Placer County Fire Department Chief. "In fact, it was the most disastrous fire season recorded in California history."

Estes said 4.2 million acres were burned in state responsibility area and national forest system land, 10,488 structures were burned or destroyed and 33 deaths were directly related to fires. There were 341 wildland fires in Placer County.

"CAL FIRE has a mission of keeping 95 percent of our fires at 10 acres or less," Estes said, noting a success rate of 95.8 percent within the county, as 14 fires grew beyond 10 acres for 1,459 total acres.

For the 2021 fire season, Estes said there are no late spring rains predicted and potential for monsoonal flow with lightning into the summer months. Estes noted burning conditions (soil moisture, fuel moisture) are three months ahead of normal.

In preparation, burning was suspended May 24. Estes said stateside staffing will peak June 11 with 411 state-funded personnel, and the county is always at full preparedness level. Across the counties, there will be 22 frontline engines, five reserve engines, five Type I hand crews, four dozer units and the aircraft will come online at Grass Valley Air Attack Base on or around June 1.

"Probably the biggest thing that we should all be concerned about is that our inmate firefighting hand crew program has literally been decimated across the state," Estes said.

According to Estes, the peak capacity of inmate hand crews is normally 160 crews with 15-17 per crew. This year, there are 80 hand crews with two local crews of 13-14 out of Nevada County.

2021 LOCAL HAZARD DRAFT MITIGATION PLAN UPDATE

Roseville, CA- Placer County's local hazard mitigation draft plan is now live on its website and the county is seeking community feedback to the plan update.

The plan, a partnership with cities and special districts, assesses the risk of floods, drought, wildfires, severe weather, and other natural hazards of concern to the county. While hazards are not always preventable, a hazard mitigation plan establishes the foundation for a long-term community strategy to reduce disaster losses, while also making Federal Emergency Management Agency resources available upon plan approval.

Public Comments Received and How Addressed

Comment Date	Person Commenting	Method Received			Comments	How addressed?
		Email	Phone	Written		
2/4/2021	Heath Wakee	X			<p>Hi Jeanine & Chris, Thank you for the good meeting today. I'm a rookie at this and I have comments but some (all) of my comments may not be relevant. If you feel that there is merit in including the mentioned risks and you need clarification, please let me know and I'll do the research.</p> <ol style="list-style-type: none"> 1. You mentioned the potential need for temporary heat and cooling shelters. What about the need for shelters when either the Hayward or San Andreas fault explode in the Bay area? We may have an influx of a million people looking for food and shelter. 2. There are many automobile bridges along Auburn Ravine including a railroad bridge. Debris can block the flow and undermine their foundations. 3. The Gold Hill Dam along Auburn Ravine is a threat to downstream dams and property. It should be evaluated to ensure that it would be able to withstand all hazards. 4. The levi along Auburn Ravine in Lincoln has failed in the past and the most recent storm resulted in some levi erosion. A larger storm would likely have breached the levi. <p>Best Regards, Stay Safe & Well, Heath Wakelee</p>	<p>Hi Heath, We are glad you could make the meeting. Good input below on problem areas and issues. I will share and discuss with the Placer County flood folks to get their input on the Auburn Ravine area, but seems like it should be included as a problem area in the plan and possible mitigation strategies identified. With respect to the Auburn Ravine area, do you all have information on specific events that resulted in road or bridge closures, flooding etc. and the impacts and damages \$\$ caused by those events. It would be good to be able to document past losses in these areas. Your concern on the big earthquake in other areas causing mass evacuations and sheltering needs is real, but really beyond the scope of this LHMP. The State of California is also required to do a state level hazard mitigation plan and that falls more under their efforts. Keep in mind that identifying problem areas and including a mitigation action in the plan does not insure it will get addressed as all projects are subject to funding, and most funding will be pursued, depending on other priorities, and if there are champions at the local government level. But identifying the issue and including it in the plan is a good start. I hope you and your group will continue to participate in this process. Feel free to reach out with any questions or additional information and we will be back in touch. Thanks, Jeanine Foster</p>

A.3 Placer County Step 3: Coordinate

This planning step credits coordinating with other agencies and key stakeholders and incorporating other plans and other agencies' efforts into the floodplain management plan or LHMP. Other agencies and organizations were contacted to determine if they have studies, plans and information pertinent to the floodplain management plan, to determine if their programs or initiatives may affect the community's program, inviting them to participate in the planning process, and otherwise asking them to support the community's efforts in this LHMP Update. Coordination efforts with these other agencies are documented in Table A-2 below.

Table A-2 List of Agencies and Key Stakeholders Coordinated with Through the 2021 LHMP Update Process

California Dept of Conservation

Good Morning,

Your request for Williamson Act data was forwarded to me.

Due to the lack of city and county reported enrollment data, the Department of Conservation does not host Williamson Act enrollment maps and/or data. For the most current and up to date information on the status of Williamson Act contracted parcels the Department suggests that interested parties contact the city or county in which the property resides. As you know the Williamson Act allows local landowners to enter into contracts with cities and/or counties, and as such, the participating city/county must retain a copy of each contract and therefore should have a record of each contracted parcel within its jurisdiction.

Sincerely,

Farl Grundy

Associate Environmental Planner
Division of Land Resource Protection

Subject: RE: Release of documents

Chris,

I have finished updating all the documents for Placer (2016), Sacramento (2018), Sutter (2018), and Yuba (2018). I have not had time to update the links on the website yet, but I didn't want you to have to wait until next week.

I have attached the documents that meet the Accessibility Standards for publishing. These include: Prime & Statewide Soils Lists (Sacramento_gSSURGO.pdf, Sutter_gSSURGO.pdf, and Yuba_gSSURGO.pdf); Land Use Summary Tables (SAC_1988_2018.xlsx, SUT_1988_2018.xlsx, and YUB_1988_2018.xlsx); and Alternate Conversion Tables (Alternate_Sacramento_County_2016-2018_Land_Use_Conversion.pdf, Alternate_Sutter_County_2016-2018_Land_Use_Conversion.pdf, and Alternate_Yuba_County_2016-2018_land_Use_Conversion.pdf).

Several of our documents are not currently ADA compliant for the web due to time constraints and/or complexity. These documents are available through our File Request System. I have included the links to these documents below:

Phone Conversation Log

Project: Placer LHMP		Date: 12/1/20
Contact Name	Dean Anderson	
Contact Organization	Placer County Office of Realtors	
Contact Phone #	dean@pcaor.com	
Subject	Placer County LHMP Update	

Items Discussed
Sent Public Outreach Flyer discussing LHMP to Dean. Dean forwarded to his group of approximately 4200 professionals. Wanted them to be aware of the LHMP Update process and that we would like their input and participation.

CA DWR/Sami Nall

Email Log

Project: Placer County 2021 LHMP Update		Date: 11/10/20
Contact Name	Sami Nall, Sr. Engineer	
Contact Organization	CA DWR, Office of Floodplain Management	
Contact Email	Sami.Nall@water.ca.gov	
Subject	DSOD Dam Data: Hazard Classifications and Inundation Data	

Items Discussed
Reached out to Sami Nall at CA DWR to find out what source should be the most current for determining Hazard Classifications and inundation data for dams, as different sources reported different data even within the CA DWR DSOD. Sami indicated that both an annual document and the DSOD viewer should be current, but that the viewer should take precedent.

Subject: RE: California DWR, DSOD data

Hi Jeanine, Let me ask DSOD about this as I would think the viewer would be more current. However there is an updated document (dated 2019) at this link: https://water.ca.gov/-/media/DWR-Website/Web-Pages/Programs/All-Programs/Division-of-Safety-of-Dams/Files/Publications/2019-Dams-Within-Jurisdiction-of-the-State-of-California-Alphabetically-by-County_a_y20.pdf.

I believe DSOD publishes an updated list every year. However, it may be taking longer to publish it because of accessibility rules. I'll also check to see if an updated list will be published in 2020.

Thanks,
Sami

National Weather Service/ Michelle Mead

Email Log

Project: Placer County 2021 LHMP Update		Date: 12/7/20
Contact Name	Michelle Mead, Meteorologist in Charge	
Contact Organization	National Weather Service, WFO Sacramento	
Contact Email	michelle.mead@NOAA.gov	
Subject	Weather Data and Available Weather Stations	

Items Discussed
Reached out to Michelle to determine where to go for better/updated weather data as some of the weather stations have limited data and some have stopped keeping data altogether. We try to find the stations that have the most data for the longest period of record (POR). Michelle suggested looking at: XMACIS: https://xmacis.rcc-acis.org/ - a site that has a lot of climate information.

Subject: Re: California Weather Data

Good morning Jeanine~

XMACIS: <https://xmacis.rcc-acis.org/> is a site that has a lot of climate information you may also find useful. It's not the most user friendly, but does give you access to all historical climatological data. The Marysville AP data on this site is up to date. I added the max temps for Marysville over the past 20 years as an example.

I have been getting these hazard mitigation emails, but have not been able to attend.

Sincerely,
Michelle

Subject: Placer County Local Hazard Mitigation Plan Public Participation

Hi All,

Placer County is looking for interest to participate in the Hazard Mitigation Planning Committee meetings and provide inputs/feedback on the process and the draft Local Hazard Mitigation Plan when completed. Interest public members can contact Young (Rod) Rodriguez or Jeanine Foster listed at the bottom of the flyer if there is any questions. Thank you.

Cheers,

Luana R Dowling

Firewise Coordinator

Project: Placer County 2021 LHMP Update		Date: 1/28/2021
Contact Name	Luanna Dowling	
Contact Organization	Placer County Firewise Community Coordinator	
Email	dowlingluana@gmail.com	
Subject	Participation in LHMP and Agency Coordination	

Items Discussed
Rod Rodriguez, County OES, contacted Luanna Dowling via phone and email to confirm her participation in the LHMP Update process and to request her help in contacting other agencies and getting the word out on the LHMP Update. This information was communicated at multiple Firewise Community meetings to let people know the LHMP Update process was underway and how they could get involved.

Follow-up		
Keep Luanna informed of the LHMP and her continued communication of the LHMP Update process as part of her Firewise Community meeting agendas		
By	Name: Jeanine Foster	Organization: Foster Morrison

Cal Fire/Steve Garcia

Project: Placer County 2021 LHMP Update	Date: June 9 &10
Meeting Purpose: Final HMPC Meeting	

Attendees: See June 10 Meeting Sign-in for all attendees – contact is for Steve Garcia		
Name	Agency	Contact Phone
Steve Garcia	Cal Fire	

Items Discussed
Steve Garcia was invited to attend the final HMPC meeting to provide input on fire issues and possible mitigation measures throughout the County from the Cal Fire perspective.

Follow-up		
Integrate information into LHMP Update

Severe Weather: Freeze and Snow	Extensive	Highly Likely	Critical	Medium	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Occasional	Limited	Medium	Medium
Severe Weather: High Winds and Tornadoes	Extensive	Highly Likely	Critical	High	Low
Tree Mortality	Extensive	Likely	Limited	High	High
Wildfire	Extensive	Highly Likely	Critical	High	High
Geographic Extent Limited: Less than 10% of planning area Significant: 10-50% of planning area Extensive: 50-100% of planning area Likelihood of Future Occurrences Highly Likely: Near 100% chance of occurrence in next year, or happens every year. Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less. Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years. Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.	Magnitude/Severity Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid Significance Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact Climate Change Influence Low: minimal potential impact Medium: moderate potential impact High: widespread potential impact				

Risk Assessment Methodology

Calculating Likelihood of Future Occurrence

The frequency of past events is used in this section to gauge the likelihood of future occurrences. Based on historical data, the likelihood of future occurrence is categorized into one of the following classifications:

- **Highly Likely:** Near 100% chance of occurrence in next year, or happens every year.
- **Likely:** Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
- **Occasional:** Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
- **Unlikely:** Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Calculating Vulnerability

Vulnerability is measured in general, qualitative terms, and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential:

- **Extremely Low:** The occurrence and potential cost of damage to life and property is very minimal to non-existent.
- **Low:** Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium:** Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High:** Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have already occurred in the past.
- **Extremely High:** Very widespread and catastrophic impact.

Defining Significance (Priority) of a Hazard

Defining the significance or priority of a hazard to a community is based on a subjective analysis of several factors. This analysis is used to focus and prioritize hazards and associated mitigation measures for the plan. These factors include the following:

- **Past Occurrences:** Frequency, extent, and magnitude of historic hazard events.
- **Likelihood of Future Occurrences:** Based on past hazard events.
- **Ability to Reduce Losses through Implementation of Mitigation Measures:** This looks at both the ability to mitigate the risk of future occurrences as well as the ability to mitigate the vulnerability of a community to a given hazard event.

Risk Assessment Summary: Placer County Planning Area

Agricultural Hazards

- Most agricultural disasters in Placer County are associated with severe weather events, including heavy rains, floods, heat, and drought; insects and noxious weeds are also a concern.
- All but one USDA declarations (24 total) from 2002-2020 were associated with severe weather events; one associated with fire. Since 2012, 20 out of 23 USDA declarations were associated with drought.
- WHAT ARE THE BIGGEST AG ISSUES RELATED TO NATURAL HAZARDS?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Priority Hazard

Avalanche

- High and moderate avalanche zones are located near the Placer-Nevada County line, south of Donner Lake and Lake Van Norden, east of Tahoe City, near Twin Peaks and McKinney Bay, and in areas near Squaw Valley, Alpine Meadows, and Sugar Bowl.
- Since 2009, there have been 286 avalanche fatalities in the US. There were 20 avalanche fatalities in Placer County between 1982 and 2020. Of these, 2 fatalities occurred in two incidents since the 2016 LHMP.
- ANY ADDITIONAL ISSUES/CONCERNS SINCE THE 2016 LHMP?
- Likelihood of Future Occurrence: Likely
- Vulnerability: Low
- Non-Priority Hazard?

Climate Change

- The 2018 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state's infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and both snowmelt and rainwater running off sooner in the year. Climate Change has the potential to alter the nature and frequency of most hazards.
- THE PLACER COUNTY SUSTAINABILITY PLAN HAS LOTS OF GREAT CLIMATE CHANGE INFO. DOES ANYONE HAVE ANY CLIMATE CHANGE CONCERNS/ISSUES TO NOTE?
- Likelihood of Future Occurrence: Likely
- Vulnerability: Medium
- Priority Hazard

Dam Failure

- According to data provided by Placer County, CA DWR, and Cal OES, there are 47 dams in the County. Of these, there are 3 extremely high hazard dams, 11 high hazard dams, 9 significant hazard dams, and 12 low hazard dams in Placer County that falls under the jurisdiction of the DSOD (jurisdictional dams

described above). 12 dams in Placer County lie outside the jurisdiction of the DSOD and do not have a hazard classification.

- In addition, there are 2 extremely high (Camp Far West/Rollins) and 4 High Hazard dams (Combie, Magnolia, Mark Edson, Lake Angela) located outside the County with inundation areas in unincorporated Placer.
- The most significant dams of concern include the Extremely High and High Hazard where loss of life is possible.
- Most inundation areas from extremely high and high dams intersect the unincorporated County; 3 dams (inside the County) also intersect Auburn – Lake Valley, LL Anderson, Sugar Pine.
- 4 Dam incidents affecting Placer County: 1964 Hell Hole Dam failure, 1986 Auburn Coffey Dam Failure. August 2004 Ralston Dam Release Gate Break, 2009 Cottonwood dam incident, Oroville Spillway Incidence 2018 (Butte County), OTHERS?
- WHAT ARE THE COUNTY’S BIGGEST CONCERN FROM DAMS? MOST NOTABLE DAMS OF CONCERN?
- Likelihood of Future Occurrence: Occasional
- Vulnerability: High to Extremely High?
- Priority Hazard

Drought and Water Shortage

- Historical drought data for the Placer County Planning Area and region indicate there have been 5 significant droughts in the last 84 years.
- Since 2012, snowpack levels in California had dropped dramatically. 2015 estimates place snowpack at 5 percent of normal levels. However, snowpack levels increased in 2016 and in 2017 snowpack levels were the highest they’ve been in 22 years. But then back down again in early 2018, only to be back up again in late 2018/2019. 2019/2020 was experiencing a fair amount of rain early on, and now again as we go in to 2021.
- 1 state (2014) disaster declarations and 1 federal declaration (1977) for Placer County since 1950. 26 USDA disaster declarations for drought 2012 – 2020. There have been 44 NCDRC drought events in Placer County.
- WHAT ARE THE BIGGEST ISSUES/IMPACTS AND CONCERNS IN THE COUNTY FROM DROUGHT AND WATER SHORTAGE?
- Likelihood of Future Occurrence: Drought - Likely/Water supply - Occasional
- Vulnerability: High
- Priority Hazard

Earthquake

- Placer County lies between two seismically active regions in the western United States. Tectonic stresses associated with the North American-Pacific Plate boundary can generate damaging earthquakes along faults 30 to 100 miles to the west of the County. Extreme eastern Placer County borders the Basin and Range province that entails most of Nevada and western Utah. This area is riddled with active faults that are responsible for and form the boundary between each basin or valley and the neighboring mountain range.
- The USGS National Seismic Hazard Maps provides acceleration and probabilities for various time periods. Placer County falls within an area of mostly low to moderate seismic risk.

- USGS identified 51, 5.0 or greater earthquakes have occurred within 90 miles of Western Placer, and 66, 5.0 or greater earthquakes have occurred within 90 miles of Eastern Placer.
- ANY SPECIFIC PAST OR FELT OCCURRENCES FROM NEARBY EVENTS? PAST DAMAGES? WHAT ABOUT THE EARTHQUAKES ON THE EASTERN SIDE OF THE COUNTY?
- DO COMMUNITIES HAVE A URM OR OTHER INVENTORY OF VULNERABLE SEISMIC BUILDINGS?
- Likelihood of Future Occurrence: Unlikely – large, damaging earthquake; Occasional – minor earthquake
- Vulnerability: High – Extremely High?
- Priority Hazard?

Flood Hazards

1%/0.5%/0.2% Annual Chance

- Historically, portions of Placer County have always been at risk to flooding because of its annual percentage of rainfall in the winter and the number of watercourses that surround/traverse the County.
- 16 state and 13 federal declarations from 1950-present were for heavy rains and flooding. 39 NCDC Flood Events, and an additional 59 events related to severe rain and storms.
- REVIEW RISK ASSESSMENT AND ADD INFORMATION ON MAJOR FLOOD EVENTS.
- NEED SUMMARY OF IMPACTS FROM THE 2017/2018 FLOOD EVENT (THAT RESULTED IN EOC ACTIVATION AND A DISASTER DECLARATION). NEED INFORMATION ON ANY OTHER EVENTS SINCE THE 2016 PLAN. HOW ABOUT 2019 AND LAST WEEK?
- Likelihood of Future Occurrence: 1%-Occasional; 0.5% and 0.2%-Unlikely
- Vulnerability: High
- Priority Hazard

Localized/Stormwater flooding

- Significant localized flood history in the County – occurs annually
- CAN THE EACH PARTICIPATING JURISDICTION PROVIDE UPDATED DETAILS ON PROBLEM AREAS? PAST OCCURRENCES?
- REVIEW RISK ASSESSMENT AND ADD INFORMATION ON SIGNIFICANT FLOOD EVENTS/ISSUES/AREAS.
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Priority Hazard

Landslides, Mudslides, and Debris Flows

- The NCDC contains no records of landslides in the County. There have been no disaster declarations associated with landslides in Placer County.
- Notable landslides of record include the landslides in the Tahoe area along the Truckee River, Squaw Creek, and Bear Creek rivers associated with the 1997 Flood event.
- Recent landslide areas of concern (from 2016 LHMP) include the following: Old Foresthill Road, Ophir Road (two sites) – (1) near Stonehouse Road and (2) near Wise Road, Yankee Jim/s Road. OTHERS?

- Other landslide incidents of varying degrees of magnitude tend to occur in places throughout the County several times in a given year, but in most cases do not cause significant damage or public safety risk.
- ANY CURRENT LOCATIONS/PAST EVENTS TO NOTE?
- Likelihood of Future Occurrence: Occasional
- Vulnerability: Low
- Non-Priority Hazard

Levee Failure

- Several levees within Placer County and its incorporated communities (Roseville/Lincoln) have been determined to provide protection from the flood that has a 1-percent-chance of being equaled or exceeded in any given year.
- There are several existing levee systems at the downstream end of Auburn Ravine (mainly past the confluence with Orchard Creek) that are not certified by FEMA as providing protection against a 1% annual chance flood.
- No past occurrences of levee failure. ANY PAST OCCURRENCES/ISSUES/CONCERNS?
- Likelihood of Future Occurrence: Unlikely
- Vulnerability: Low
- Non-Priority Hazard

Pandemic

- The 20th Century had 3 Pandemics (WHO): 1918-1919 Influenza Pandemic (H1N1), 1957-1958 Influenza Pandemic (H2N2), and the 1968 Influenza Pandemic (H3N2). The 21st Century had 2 Pandemics (WHO): 2009 Swine Flu (H1N1) and 2020 Covid-19.
- One 2020 state and federal declaration for Covid-19; the NCDC does not track pandemics.
- The Placer County EOC was activated for COVID-19 in March – April (Level 1), May (Level 2), and June (Level 3).
- As of early February 2021, there had been over 18,000 cases of Covid-19 in the County and around 200 deaths.
- CAN WE GET A BRIEF SUMMARY OF PLACER COUNTY COVID-19 IMPACTS/ RESPONSE EFFORTS/PRIMARY ISSUES/CONCERNS? WHAT ABOUT THE 2009 SWINE FLU?
- Likelihood of Future Occurrence: Likely
- Vulnerability: High
- Priority Hazard

Seiche

- Research from the University of Nevada estimates that an earthquake must be at least a magnitude 6.5 to cause a damaging seiche at Lake Tahoe. The three faults directly underneath the lake are considered capable of generating magnitude 7.0 or larger earthquakes. Computer models of seiche activity at Lake Tahoe prepared by the University of Nevada research team estimate that waves as high as 30 feet could strike the shore. These projections suggest largest waves might hit Sugar Pine Point, Rubicon Point, and the casinos in South Lake Tahoe.
- There have been no occurrences of major seiche activity at Lake Tahoe in recent years. University of Nevada geologists have found deposits that extend for 10 miles along the McKinney Bay shore from

Sunnyside through Tahoma. These deposits indicate a tsunami or seiche with 30-foot-high waves occurred approximately 7,000 years ago.

- ANYTHING TO UPDATE FOR SEICHE?
- Likelihood of Future Occurrence: Unlikely
- Vulnerability: High
- Non-Priority Hazard?

Severe Weather

Extreme Heat

- Annual occurrences of hot temperatures. The highest recorded daily extreme was 113°F in July 1972 in western Placer. In a typical year, maximum temperatures exceed 90°F on 67.7 days in western Placer.
- In eastern Placer, the highest recorded daily extreme was 94°F in July 1933. In a typical year, maximum temperatures exceed 90°F on 0.4 days in eastern Placer.
- No state or federal disaster declarations. 5 USDA declarations since 2012. 32 extreme heat events (NCDC) since 1950.
- Climate change likely to affect this hazard in the future.
- EOC activations include an Extreme Heat and Potential Rolling Blackout in August 2020; numerous PSPS events: 2018 (2), 2019 (7), 2020 (5).
- IS THERE A SUMMARY OF PSPS EVENTS, AREAS AFFECTED, DURATION, ETC. TO NOTE?
- PLEASE PROVIDE DETAILS ON OTHER EXTREME HEAT EVENTS/MAJOR CONCERNS?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Priority Hazard

Freeze and Snow

- Annual occurrences of winter weather
- The lowest recorded daily extreme was 16°F in 1972 in western Placer. In a typical year, minimum temperatures fall below 32°F on 22.6 days with 0 days falling below 0°F. Average snowfall on the western side of the County is 1.4 inches
- The lowest recorded daily extreme was -16°F in 1972 in eastern Placer. In a typical year, minimum temperatures fall below 32°F on 209 days with 0.4 days falling below 0°F. Average snowfall on the eastern side of the County is 190.7 inches.
- 913 severe winter weather and freeze events (NCDC) from 1993-2014
- 1 freeze and severe weather state Disaster Declaration, 1972
- HMPC TO REVIEW RISK ASSESSMENT TO PROVIDE DETAILS ON MAJOR FREEZE AND SNOW EVENTS IN THE COUNTY. WHAT ABOUT BIG SNOW EVENTS IN THE EASTERN SIDE OF THE COUNTY SINCE 2016? HOW ABOUT THIS LAST WEEK?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Priority Hazard

Heavy Rains and Storms (Hail, Lightning, Wind)

- Significant County history: annual occurrences; Severe storms/heavy rains are the primary cause of most major flooding.
- Average annual precipitation in western Placer County is 34.39 inches per year. The highest recorded annual precipitation is 64.87 inches in 1983; the highest recorded precipitation for a 24-hour period is 5.41 inches on October 13, 1962. The lowest recorded annual precipitation was 11.76 inches in 1976.
- Average annual precipitation in eastern Placer County is 31.46 inches per year. The highest recorded annual precipitation is 66.41 inches in 1996; the highest recorded precipitation for a 24-hour period is 7.0 inches on November 4, 1903. The lowest recorded annual precipitation was 9.34 inches in 1976.
- There have been 16 federal and 13 state declarations since 1950 for flooding, including heavy rains and storms. Since 2012, there have been 9 USDA declarations related to heavy rains.
- The NCDC data recorded 68 events for Placer County since 1950.
- CAN THE HMPC PROVIDE DETAILS ON HEAVY RAIN AND STORM EVENTS, INCLUDING HAIL, LIGHTNING, AND WIND IN THE COUNTY SINCE 2013. PA SHEETS? OTHER?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Priority Hazard

Tree Mortality

- Tree Mortality has been a significant issue in Placer County since the 2012-2016 tree mortality event in the central and southern Sierra Nevada counties.
- No state or federal disaster declarations for Tree Mortality since 1950. A state of emergency was declared in 2015. NCDC does not track tree mortality issues.
- CAN THE COUNTY PROVIDE US WITH DATA AND PROBLEM AREAS, KEY ISSUES/CONCERNS RELATED TO TREE MORTALITY? INCLUDE BOTH PAST EVENTS, AREAS AFFECTED, AND MITIGATION UNDERTAKEN SINCE 2016.
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: High
- Priority Hazard

Wildfire

- Wildfires occur on an annual basis in the Placer County Planning Area.
- Any ignition has the potential to become an out of control wildfire.
- Numerous named fires causing a variety of damages.
- 5 state and 6 federal disaster declarations for Wildfire since 1950.
- Cal Fire database lists numerous notable fires; 22 NCDC wildfire events since 1993.
- Significant wildfires since the 2016 LHMP include those where EOC was activated: Trail Head Fire (2016), North Fire, Sliger Fire, and Camp Fire (2018), Fork Fire (2020). NEED SPECIFIC IMPACTS TO COUNTY AND JURISDICTIONS FROM THESE FIRES.
- OTHER SIGNIFICANT HISTORIC WILDFIRES AND PAST DAMAGES/ IMPACTS/ ISSUES SINCE 2016? INCLUDE THOSE BOTH OCCURRING INSIDE AND OUTSIDE THE COUNTY WHERE THE COUNTY WAS AFFECTED? 2020 NORTH COMPLEX FIRE?
- INCLUDE INFORMATION ON IMPACTS AND DAMAGES, AIR QUALITY AND SMOKE ISSUES? EVACUATION OR MUTUAL AID SUPPORT? OTHER?

- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Extremely High
- Priority Hazard

Data Needs

Review of Key Items to Date

- Hazard-specific data
 - ✓ Hazard ID tables
 - ✓ Historic Hazard Worksheets or list of past hazard occurrences and impacts to each jurisdiction
 - Old participating jurisdictions – need past occurrences/hazard history since 2016
 - New participating jurisdictions –significant hazard occurrences - back 50 years or so
- Risk Assessment Worksheets (County)
- Data on future development areas (County/Cities)

Other Data Items

General

- Logos for each participating jurisdiction
- Historic Hazard Data and Key areas affected by Jurisdiction (items identified in today's meeting)
- PA Summaries
- Photos, Photos, Photos
- Review of Updated Chapter 4 Risk Assessment and Jurisdictional Annexes

A.4.3. Mitigation Strategy Meeting Handouts

Handouts specific to the Risk Assessment Meeting can be found in Appendix C.

A.4.4. Final HMPC Meeting Handouts

The Final Meeting handout is contained in Section 2.2 of the Base Plan.

A.4.5. Initial Public Meeting Handouts

Placer County LHMP Update: 2021 Hazards

- Avalanche
- Climate Change
- Dam Failure
- Drought and Water Shortage
- Earthquake
- Flood: (1%/0.2% year)
- Flood: Localized/Stormwater
- Landslide, Mudslide, and Debris Flows
- Levee Failure
- Pandemic
- Seiche
- Severe Weather: Extreme Heat
- Severe Weather: Freeze and Snow
- Severe Weather: Heavy Rains and Storms (Hail, Lightning)
- Severe Weather: High Winds and Tornadoes
- Wildfire

Placer County Historic Hazard Worksheet (Past Occurrences)

Please fill out one sheet for each significant hazard event with as much detail as possible. Attach supporting documentation, photocopies of newspaper articles, or other original sources.

Placer County
Local Hazard Mitigation Plan Update
HMPC Meetings #3 & 4 - Mitigation Strategy Meetings
February 24 & March 2, 2021

Table of Contents:

Agenda

Day 1:

- LHMP Project Status/Next Steps/Timeline...4
- Hazard Identification & Profiles...5
- Risk Assessment Methodology...6
- Priority Hazards ...7
- Data Needs...8
- Mitigation Strategy: Goals...9
- 2018 State HMP/2016 LHMP Goals...10
- Example Goal Statements...12
- Goals Development...13

Day 2:

- Mitigation Action Strategy Development: Ground Rules...15
- Mitigation Strategy: Actions ...16
- Categories of Mitigation Measures...16
- Mitigation Measures from Placer 2016 LHMP...20
- Mitigation Strategy: Action Plan...27
- Mitigation Criteria ...27
- Mitigation Action Prioritization Instructions...30
- Mitigation Action Worksheet ...31

AGENDA

Placer County
Local Hazard Mitigation Plan (LHMP) Update
HMPC Meetings #3 & #4 - Mitigation Strategy Meetings
February 24 & March 2, 2021

HMPC Meeting #3: (1.5 hours)

1. Introductions
2. LHMP Project Status and Next Steps/Timeline
3. Priority Hazards Review
4. Develop Plan Goals and Objectives
5. Introduction to HMPC Meeting #4: Mitigation Alternatives/Actions/Projects

HMPC Meeting #4: (2 to 2.5 hours)

1. Introductions
2. Review Mitigation Categories and Selection Criteria
3. Brainstorming of Mitigation Alternatives/Actions/Projects by Hazard
4. Review of Voting Process for Prioritization of Mitigation Actions/Projects
5. Questions

**Mitigation Strategy Meetings
February 24 & March 2, 2021
Day 1**

Status of the 2021 Placer County LHMP Update Project/Next Steps

LHMP Update Project Schedule/Key Dates

2021 LHMP Update Meetings

- **February 24** (Wednesday) HMPC Meeting #3 (Mitigation Strategy: Goals Development) (2:00-3:30 pm)
- **March 2** (Tuesday) HMPC Meeting #4 (Mitigation Strategy: Actions and Projects) (2:00-4:30 pm)
- **June 9** (Wednesday) Public Meeting #2 (6:00-7:30 pm)
- **June 10** (Thursday) HMPC Meeting #5 (2:00-4:00 pm)

Mitigation Strategy Meetings - Follow up

- **March 5** (Friday) Mitigation Strategy Actions and Projects processed and voting site launched
- **March 12** (Friday) Voting ends
- **March 19** (Friday) Foster Morrison to send Mitigation Action prioritization follow up to HMPC
- **April 9** (Friday) Planning Team Mitigation Action (Project) Worksheets due to Foster Morrison

LHMP Document Drafts

- **March 1 – 5** (M-F) Foster Morrison to send out draft Jurisdictional Annexes for input
- **April 9** (Friday) Jurisdictions to return updated Annexes to Foster Morrison
- **April 16** (Friday) HMPC (First) Draft LHMP to County
- **May 7** (Friday) HMPC comments due on Draft Plan
- **May 19** (Wednesday) Comments incorporated into Public Review (Second) Draft to County
- **May 26** (Wednesday) County to place Public Review Draft on County website
- **June 18** (Friday) all final Planning Team and Public input to Foster Morrison
- **June 30** (Wednesday) Public and HMPC comments incorporated and LHMP submittal to Cal OES – June 2021

Participating Jurisdictions

- County
- All 5 incorporated communities (have hazard data returned from all but 2 incorporated communities)
- 19 District Annexes – (have hazard data returned for all but 1 District)
- **25 Total Participating Jurisdictions**

Placer County Hazard Identification & Profiles

Hazard	Geographic Extent	Likelihood of Future Occurrences	Magnitude/Severity	Significance	Climate Change Influence
Agricultural Hazards	Significant	Highly Likely	Critical	Medium	Medium
Avalanche	Limited	Likely	Limited	Medium	Medium
Climate Change	Extensive	Likely	Limited	Medium	–
Dam Failure	Significant	Occasional	Critical	High	Medium
Drought & Water Shortage	Extensive	Likely	Critical	High	High
Earthquake	Significant	Occasional	Critical	Medium	Low
Floods: 1%/0.2% annual chance	Limited	Occasional	Critical	High	Medium
Floods: Localized Stormwater	Limited	Occasional/Highly Likely	Limited	Medium	Medium
Landslides, Mudslides, and Debris Flows	Limited	Occasional	Limited	Low	Medium
Levee Failure	Limited	Unlikely	Limited	Low	Medium
Pandemic	Extensive	Likely	Catastrophic	Medium	Medium
Seiche	Limited	Unlikely	Limited	Low	Medium
Severe Weather: Extreme Heat	Extensive	Highly Likely	Limited	Medium	High
Severe Weather: Freeze and Snow	Extensive	Highly Likely	Critical	Medium	Medium
Severe Weather: Heavy Rains and Storms	Extensive	Occasional	Limited	Medium	Medium
Severe Weather: High Winds and Tornadoes	Extensive	Highly Likely	Critical	High	Low
Tree Mortality	Extensive	Likely	Limited	High	High
Wildfire	Extensive	Highly Likely	Critical	High	High
Geographic Extent		Magnitude/Severity			
Limited: Less than 10% of planning area		Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths			
Significant: 10-50% of planning area		Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability			
Extensive: 50-100% of planning area		Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability			
Likelihood of Future Occurrences		Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid			
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.		Significance			
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.		Low: minimal potential impact			
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.		Medium: moderate potential impact			
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.		High: widespread potential impact			
		Climate Change Influence			
		Low: minimal potential impact			
		Medium: moderate potential impact			
		High: widespread potential impact			

Risk Assessment Methodology

Calculating Likelihood of Future Occurrence

The frequency of past events is used in this section to gauge the likelihood of future occurrences. Based on historical data, the likelihood of future occurrence is categorized into one of the following classifications:

- **Highly Likely:** Near 100% chance of occurrence in next year, or happens every year.
- **Likely:** Between 10 and 90% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
- **Occasional:** Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
- **Unlikely:** Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Calculating Vulnerability

Vulnerability is measured in general, qualitative terms, and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential:

- **Extremely Low:** The occurrence and potential cost of damage to life and property is very minimal to non-existent.
- **Low:** Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium:** Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High:** Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have already occurred in the past.
- **Extremely High:** Very widespread and catastrophic impact.

Defining Significance (Priority) of a Hazard

Defining the significance or priority of a hazard to a community is based on a subjective analysis of several factors. This analysis is used to focus and prioritize hazards and associated mitigation measures for the plan. These factors include the following:

- **Past Occurrences:** Frequency, extent, and magnitude of historic hazard events.
- **Likelihood of Future Occurrences:** Based on past hazard events.
- **Ability to Reduce Losses through Implementation of Mitigation Measures:** This looks at both the ability to mitigate the risk of future occurrences as well as the ability to mitigate the vulnerability of a community to a given hazard event.

Placer County Priority Hazards

- Agricultural Hazards
- Avalanche
- Climate Change
- Dam Failure
- Drought & Water Shortage
- Earthquake
- Flood: 1%/0.2% annual chance
- Flood: Localized/Stormwater
- Landslide, Mudslide, Debris Flow
- Pandemic
- Severe Weather: Extreme Heat
- Severe Weather: Freeze and Snow
- Severe Weather: Heavy Rains and Storms (hail, lightning)
- Severe Weather: High Winds and Tornadoes
- Tree Mortality
- Wildfire

Non-Priority Hazards:

- Levee Failure
- Seiche

Jurisdiction: _____

Priority Hazards???

- Agricultural Hazards
- Avalanche
- Climate Change
- Dam Failure
- Drought & Water Shortage
- Earthquake
- Flood: 1%/0.2% annual chance
- Flood: Localized/Stormwater
- Landslide, Mudslide, Debris Flow
- Levee Failure
- Pandemic
- Seiche
- Severe Weather: Extreme Heat
- Severe Weather: Freeze and Snow
- Severe Weather: Heavy Rains and Storms (hail, lightning)
- Severe Weather: High Winds and Tornadoes
- Tree Mortality
- Wildfire

Data Needs

Review of Key Items to Date

- Hazard-specific data
 - ✓ Hazard ID tables
 - ✓ Historic Hazard Worksheets or list of past hazard occurrences and impacts to each jurisdiction
 - Old participating jurisdictions – need past occurrences/hazard history since 2016
 - New participating jurisdictions –significant hazard occurrences - back 50 years or so
 - PA Summaries from 2017 Disaster Declarations for affected communities
- Risk Assessment Worksheet (County)
 - ✓ Data on future development areas (County/Cities)
- Status updates to 2016 Mitigation Actions/Projects

Other Data Items

- Logos for each participating jurisdiction
- Photos, Photos, Photos
- Updated Goals Statements **by March 5th**
- New/Carry over Mitigation Action Worksheets due **by April 9th**
- Jurisdictions to return updated Annexes to Foster Morrison **by April 9th**

Mitigation Strategy: Goals

The most important element of the LHMP is the resulting mitigation strategy which serves as the long-term blueprint for reducing the potential losses identified in the risk assessment. The mitigation strategy is comprised of three components:

6. Mitigation Goals
7. Mitigation Actions
8. Mitigation Action (Implementation) Plan

Mitigation Goals

Up to now, the HMPC has been involved in collecting and providing data for the Placer County Local Hazard Mitigation Plan Update. From this information, a Risk Assessment has been developed that describes the risk and vulnerability of the Placer County Planning Area to identified hazards and includes an assessment of the area's current capabilities for countering these threats through existing policies, regulations, programs, and projects.

This analysis identifies areas where improvements could or should be made. Formulating Goals will lead to incorporating these improvements into the Mitigation Strategy portion of the LHMP. Our planning goals should provide direction for what loss reduction activities can be undertaken to make the Planning Area and Participating Jurisdictions more disaster resistant.

Mitigation Goals are general guidelines that represent the community's vision for reducing or avoiding losses from identified hazards. Goals are stated without regard for achievement, that is, implementation, cost, schedule, and means are not considered. ***Goals are public policy statements that:***

- **Represent basic desires of the jurisdiction;**
 - **Encompass all aspects of planning area, public and private;**
 - **Are nonspecific, in that they refer to the quality (not the quantity) of the outcome;**
 - **Are future-oriented, in that they are achievable in the future; and**
 - **Are time-independent, in that they are not scheduled events.**
- ❖ *While goals are not specific (quantitative), they should not be so general as to be meaningless or unachievable.*
 - ❖ *Goals statements will form the basis for objectives. They should be stated in such a way as to develop one or more objectives related to each goal.*
 - ❖ *The key point in writing goals is to remember that they must deal with results, not the activities that produce those results.*
 - ❖ *Consider other planning area goals from other regional/county/city programs, plans and priorities.*

Types/Sources of other area mitigation plans/ programs include:

- General Plans
- Stormwater Program and Plans
- Flood/Watershed Management Plans and Studies
- Drought Plans, Urban/Integrated Regional Water Management Plan
- Community Wildfire Protection Plans
- Strategic Fire Plans
- Dam Emergency Action Plans
- Emergency Operations Plans
- Climate Adaptation Plans
- Other?

2018 State Plan/2016 Placer County LHMP Goals

Goals from the 2018 California State Hazard Mitigation Plan

1. Significantly reduce life loss and injuries.
2. Minimize damage to structures and property, as well as minimizing interruption of essential services and activities.
3. Protect the environment.
4. Promote community resilience through integration of hazard mitigation with public policy and standard business practices.

Placer County 2016 LHMP Update (This is what we are updating)

Goal 1: Minimize risk and vulnerability of Placer County to the impacts of natural hazards and protect lives and reduce damages and losses to property, economy, public health and safety, and the environment.

- Minimize economic and resource impacts and promote long-term viability and sustainability of County resources
- Minimize impacts to both existing and future development from all hazards (through well-planned communities)
- Minimize impacts to natural and cultural resources
- Minimize impacts from climate change
- Minimize impacts to watersheds/Promote watershed health
- Prevent and reduce wildland fire risk and related losses
- Prevent and reduce flood risk and related damages, with a focus on repetitive loss structures and infrastructure

Goal 2: Provide protection for critical facilities, infrastructure, utilities and services from hazard impacts.

- Provide protection for critical infrastructure from the wildland fires, floods, and severe storms/weather (e.g., repeaters, cell towers, water tanks, utilities)
- Improve infrastructure/system reliability for critical lifeline utilities, including stormwater systems, roadways (evacuation routes, emergency services and supplies); rail lines, and pipelines.
- Minimize risk of loss of life and injury to At-risk Populations

Goal 3: Improve public awareness, education, and preparedness for all hazards.

- Enhance public outreach, education, and preparedness program to include all hazards of concern (e.g. fire restrictions, water conservation measures, hazardous vegetation, air and water quality issues)
- Increase public knowledge of the risk and vulnerability to identified hazards and their recommended responses to disaster events to reduce losses
- Educate general public on evacuation planning and sheltering options for all hazard types and to encompass all groups (e.g., residents, visitors, second homeowners, vulnerable populations, animals)
- Increase community awareness and participation in hazard mitigation activities to include defensible space, hazardous vegetation abatement projects, and forest management projects and practices to reduce flood risk on private property
- Utilize multiple public outreach avenues such as schools, new technologies, and social media
- Coordination with other regional jurisdictions to facilitate (consistent/coordinated) public information function prior to, during and after an event (e.g., facebook, twitter, everbridge, web, tv, radio)

Goal 4: Increase communities' capabilities to mitigate losses and to be prepared for, respond to, and recover from a disaster event.

- Continued enhancements to Emergency Services capabilities integrating new technologies to reduce losses and save lives
- Improve interagency (local, state, federal) emergency coordination, planning, training, exercising, and communication to ensure effective community preparedness, response and recovery
- Improve interagency coordination with respect to implementation of mitigation activities such as fuels reduction and other multi-jurisdictional wildland fire projects
- Enhance the use of shared resources/Develop a strong mutual aid support system
- Maintain current service levels/provide for enhanced service levels
- Increase first responders awareness of vulnerable populations and other priority needs during a hazard event;(use of technology to pre-identify and communicate)
- Utilize lessons learned (debriefing) to improve response capabilities
- Promote efficient recovery from incidents to minimize impacts to lives, environment, and economy

Goal 5: Maintain FEMA Eligibility/Position the communities for grant funding.

- Continued compliance with the NFIP/enhancement of floodplain management program through participation in the NFIP's Community Rating System (CRS) where feasible.

Example Goal Statements

- Minimize risk and vulnerability from natural hazards
- Increase communities' awareness of vulnerability to hazards
- Increase the use of shared resources
- Improve communities' capabilities to mitigate losses
- Maintain coordination of disaster plans with changing DHS/FEMA needs
- Maintain FEMA eligibility/position jurisdictions for grant funding
- Maintain/enhance the flood mitigation program to provide 200/500-year flood protection
- Maintain current service levels
- Provide protection for existing buildings from hazards
- Provide protection for future development from hazards
- Provide protection for natural and cultural resources from hazard impacts
- Provide protection for people's lives from hazards
- Provide protection for public health
- Provide protection for critical services (fire, police, etc.) from hazard impacts
- Provide protection for critical lifeline utilities from hazard impacts
- Reduce exposure to hazard related losses
- Reduce the number of emergency incidents
- Make better use of technology

General Recommendation for Categories of Goals

- Reduce Losses/Protection of Life, Property, Public Health, and the Environment from all Hazards
- Reduce Losses/Protection of Critical Facilities and Infrastructure from all Hazards
- Public Education
- Increase County Capabilities to all Hazards
- Any Hazard-specific goals

Goals Development

The purpose of goal's development is to reach a consensus on updated goals for the Placer County 2021 LHMP Updates. Provided above are example goals for this LHMP and goals from the previous 2016 Placer County LHMP. *You may reword those above or develop your own updated goals.*

Each person should provide either via chat (on this zoom call) or email to Jeanine.foster@fostermorrison.com: Two (2) goals they would like to see included for this 2021 Placer County LHMP Update. (Please submit by Friday, March 5th)

When collated, we will combine and rework them into 4-6 goals for this LHMP Update and send them out to the HMPC for further review and refinement.

**Mitigation Strategy Meetings
February 24 & March 2, 2021
Day 2**

Mitigation Strategy Action Development: Ground Rules

Rule 1: All Participating Jurisdictions **MUST** have a Mitigation Action/Project to address each of their Priority Hazards (those rated as a high or medium significance in their respective Hazard Identification table).

Rule 2: Every Mitigation Action/Project **MUST** be supported by Risk Assessment Data contained within Chap 4 of the Base Plan and/or within each Participating Jurisdictions' Annexes. Note: this might necessitate backfilling the hazard risk assessment data.

Rule 3: The Mitigation Actions/Projects for this 2021 LHMP Update should reflect each Participating Jurisdictions' WISH LIST for mitigation, regardless of funding source.

Rule 4: Any Mitigation Action/Project that might be considered for FEMA mitigation grant funding over the next 5-years covered by this LHMP **MUST** be included in this 2021 LHMP Update.

Rule 5: While the updated Mitigation Strategy should include all potential Mitigation Actions/Projects for each Participating Jurisdiction (regardless of funding source), keep in mind that no one is obligated to implement **ANY** of the identified Mitigation Actions/Projects – all are always subject to funding and changing priorities.

Rule 6: Each Mitigation Action/Project to be included in this LHMP Update **MUST** have a Mitigation Action Worksheet completed by each Participating Jurisdictions. This applies to Mitigation Actions/Projects being carried forward from the 2016 LHMP.

Rule 7: Participating Jurisdictions **CAN** include Mitigation Actions/Projects that might not get identified during this Mitigation Action/Project Prioritization process – the key is to complete a Mitigation Action Worksheet for any project to be included in the updated LHMP prior to submittal to Cal OES/FEMA.

REMEMBER: Having a FEMA approved LHMP for your Jurisdiction is a prerequisite for being eligible to apply for FEMA pre and post mitigation funding.

Mitigation Strategy: Actions

Mitigation Actions are specific projects and activities that help achieve the goals and accomplish risk reduction in the community.

Categories of Mitigation Measures

PREVENTION: Preventive measures are designed to keep the problem from occurring or getting worse. Their objective is to ensure that future development is not exposed to damage and does not increase damage to other properties.

- Planning
- Zoning
- Open Space Preservation
- Land Development Regulations
 - ✓ Subdivision regulations
 - ✓ Building Codes
 - Fire-Wise Construction
 - ✓ Floodplain development regulations
 - ✓ Geologic Hazard Areas development regulations (for roads too!)
- Storm Water Management
- Fuels Management, Fire-Breaks

EMERGENCY SERVICES: protect people during and after a disaster. A good emergency services program addresses all hazards. Measures include:

- Warning (flooding, tornadoes, winter storms, geologic hazards, fire)
 - ✓ NOAA Weather Radio
 - ✓ Sirens
 - ✓ “Reverse 911” (Emergency Notification System)
- Emergency Response
 - ✓ Evacuation & Sheltering
 - ✓ Communications
 - ✓ Backup power supply/generators
 - ✓ Emergency Planning
 - Activating the EOC (emergency management)
 - Closing streets or bridges (police or public works)
 - Shutting off power to threatened areas (utility company)
 - Holding/releasing children at school (school district)
 - Ordering an evacuation (mayor)
 - Opening emergency shelters (Red Cross)
 - Monitoring water levels (engineering)
 - Security and other protection measures (police)
- Critical Facilities Protection (Buildings or locations vital to the response and recovery effort, such as police/fire stations, hospitals, sewage treatment plants/lift stations, power substations)

- ✓ Buildings or locations that, if damaged, would create secondary disasters, such as hazardous materials facilities and nursing homes
- ✓ Lifeline Utilities Protection
- Post-Disaster Mitigation
- Building Inspections
 - ✓ ID mitigation opportunities & funding before reconstruction

PROPERTY PROTECTION: Property protection measures are used to modify buildings subject to damage rather than to keep the hazard away. A community may find these to be inexpensive measures because often they are implemented by or cost-shared with property owners. Many of the measures do not affect the appearance or use of a building, which makes them particularly appropriate for historical sites and landmarks.

- Retrofitting/disaster proofing
 - ✓ Floods
 - Wet/Dry floodproofing (barriers, shields, backflow valves)
 - Relocation/Elevation
 - Acquisition
 - Retrofitting
 - ✓ High Winds/Tornadoes
 - Safe Rooms
 - Securing roofs and foundations with fasteners and tie-downs
 - Strengthening garage doors and other large openings
 - ✓ Winter Storms
 - Immediate snow/ice removal from roofs, tree limbs
 - “Living” snow fences
 - ✓ Geologic Hazards (Landslides, earthquakes, sinkholes)
 - Anchoring, bracing, shear walls
 - Dewatering sites, agricultural practices
 - Catch basins
 - ✓ Drought
 - Improve water supply (transport/storage/conservation)
 - Remove moisture competitive plants (Tamarisk/Salt Cedar)
 - Water Restrictions/Water Saver Sprinklers/Appliances
 - Grazing on CRP lands (no overgrazing-see Noxious Weeds)
 - Create incentives to consolidate/connect water services
 - Recycled wastewater on golf courses
 - ✓ Wildfire, Grassfires
 - Replacing building components with fireproof materials
 - Roofing, screening
 - Create “Defensible Space”
 - Installing spark arrestors
 - Fuels Modification

- ✓ Noxious Weeds/Insects
 - Mowing
 - Spraying
 - Replacement planting
 - Stop overgrazing
 - Introduce natural predators

➤ Insurance

NATURAL RESOURCE PROTECTION: Natural resource protection activities are generally aimed at preserving (or in some cases restoring) natural areas. In so doing, these activities enable the naturally beneficial functions of floodplains and watersheds to be better realized. These natural and beneficial floodplain functions include the following:

- storage of floodwaters
- absorption of flood energy
- reduction in flood scour
- infiltration that absorbs overland flood flow
- groundwater recharge
- removal/filtering of excess nutrients, pollutants, and sediments from floodwaters
- habitat for flora and fauna
- recreational and aesthetic opportunities

Methods of protecting natural resources include:

- Wetlands Protection
- Riparian Area/Habitat Protection/Threatened-Endangered Species
- Erosion & Sediment Control
- Best Management Practices

Best management practices (“BMPs”) are measures that reduce nonpoint source pollutants that enter the waterways. Nonpoint source pollutants come from non-specific locations. Examples of nonpoint source pollutants are lawn fertilizers, pesticides, and other farm chemicals, animal wastes, oils from street surfaces and industrial areas and sediment from agriculture, construction, mining and forestry. These pollutants are washed off the ground’s surface by stormwater and flushed into receiving storm sewers, ditches and streams. BMPs can be implemented during construction and as part of a project’s design to permanently address nonpoint source pollutants. There are three general categories of BMPs:

9. Avoidance: setting construction projects back from the stream.
10. Reduction: Preventing runoff that conveys sediment and other water-borne pollutants, such as planting proper vegetation and conservation tillage.
11. Cleanse: Stopping pollutants after they are en route to a stream, such as using grass drainageways that filter the water and retention and detention basins that let pollutants settle to the bottom before they are drained

- Dumping Regulations
- Set-back regulations/buffers

- Fuels Management
- Water Use Restrictions
- Landscape Management
- Weather Modification

STRUCTURAL: Projects that have traditionally been used by communities to control flows and water surface elevations. Structural projects keep flood waters away from an area. They are usually designed by engineers and managed or maintained by public works staff. These measures are popular with many because they “stop” flooding problems. However, structural projects have several important shortcomings that need to be kept in mind when considering them for flood hazard mitigation:

- They are expensive, sometimes requiring capital bond issues and/or cost sharing with Federal agencies, such as the U.S. Army Corps of Engineers or the Natural Resources Conservation Service.
- They disturb the land and disrupt natural water flows, often destroying habitats or requiring Environmental Assessments.
- They are built to a certain flood protection level that can be exceeded by a larger flood, causing extensive damage.
- They can create a false sense of security when people protected by a structure believe that no flood can ever reach them.
- They require regular maintenance to ensure that they continue to provide their design protection level.

Structural measures include:

- Detention/Retention structures
- Erosion and Sediment Control
- Basins/Low-head Weirs
- Channel Modifications
- Culvert resizing/replacement/Maintenance
- Levees and Floodwalls
- Anchoring, grading, debris basins (for landslides)
- Fencing (for snow, sand, wind)
- Drainage System Maintenance
- Reservoirs (for flood control, water storage, recreation, agriculture)
- Diversions
- Storm Sewers

PUBLIC INFORMATION: A successful hazard mitigation program involves both the public and private sectors. Public information activities advise property owners, renters, businesses, and local officials about hazards and ways to protect people and property from these hazards. These activities can motivate people to take protection:

- Hazard Maps and Data
- Outreach Projects (mailings, media, web, speakers, displays)
- Library Resources
- Real Estate Disclosure
- Environmental Education

Mitigation Measures from 2016 Placer County LHMP (This is what we are updating)

Action Title	Complete	Ongoing	Not Yet Started	In 2021 Plan Update
Placer County				
Multi-Hazard Actions				
Integrate Local Hazard Mitigation Plan into Safety Element of General Plan				
Enhance Public Education and Awareness of Natural Hazards and Public Understanding of Disaster Preparedness				
Trail System Way Finding and Directional Signage				
Disaster Debris Management Plan				
Agricultural Actions				
Pest Detection Programs				
Noxious Weed Eradication Programs				
Dam Failure Actions				
Cottonwood Dam Restoration				
Drought Actions				
Retrofit of High Water Use Landscape & Irrigation				
Drought Public Education and Outreach				
Erosion Actions				
Bear Creek Bank Restoration				
Lake Tahoe Basin Environmental Improvement Program (EIP)				
Earthquake Actions				
Fire Station Seismic Upgrade				
Dewitt Demolition				
Health Care Facility Seismic Resiliency				
Flood Actions				
Community Rating System (CRS) Maintain and Enhance				
Stream Channel Clearing – Western Placer County				
Van Norden Dam Lowering and Meadow Restoration				
Miners Ravine Sewer Pipeline Repair				
Sewer System Management Plan Updates				
Stormwater Drainage Improvements				
Bridge and Culvert replacement and drainage improvements				
Urban Level of Flood Protection Mapping				
Elevate Remaining 95 Homes in the Dry Creek Watershed				
Elevate Repetitive Loss Structures in 100-year Floodplain				
Hazardous Material Actions				

Action Title	Complete	Ongoing	Not Yet Started	In 2021 Plan Update
Natural Hazard Minimization Evaluation focusing on top 5 facilities in Placer County producing large quantities of hazardous waste/storage of such hazardous materials				
Wildfire Actions				
Large Strategic Fuel Break				
Fuel Breaks in the Wildland Urban Interface (WUI)				
Wildfire Public Education				
Natural Systems Protection / Education and Awareness Programs – Placer County Wildland Urban Interface (WUI) Strategic Planning				
North Fork American River Fuel Break				
Defensible Space Programs				
Project that focus on Open Space/Defensible Space				
Annual Multi-Agency Wildland Fire Drill				
Vegetation Management – Ongoing Maintenance of Fuel Breaks				
City of Auburn				
Integrate Local Hazard Mitigation Plan into Safety Element of General Plan				
Lincoln Basin (Downtown) Drainage Infrastructure				
Creek and Stream Cleaning and Maintenance Program				
Implementation of Storm Water Treatment Plan				
Electric Street Diversion Project				
Old Town Auburn Storm Drain System				
American River Canyon Shaded Fuel Break				
Community Education on Wildfire				
Residential Home Inspections for Compliance of Fire Safe Standards; Defensible Space.				
Maintenance of the Private Lands Portion of the Shaded Fuel Break Along the Rim of the American River Canyon and the Auburn State Recreation Area (ASRA)				
City of Colfax				
Integrate Local Hazard Mitigation Plan into Safety Element of General Plan				
Continue Annual Weed Abatement Ordinance				
Colfax Schools Evacuation Site Shaded Fuel Break				
Evaluate the Need and Feasibility of Improving Fire Prevention for the Historic Business District				
City of Lincoln				
Integrate Local Hazard Mitigation Plan into Safety Element of General Plan				

Action Title	Complete	Ongoing	Not Yet Started	In 2021 Plan Update
Lincoln Boulevard: Auburn Ravine Bridge – Reconstruct Bridge				
McBean Park Drive: Auburn Ravine Bridge – Additional 110' Span				
Lakeview Farms Regional Volumetric Mitigation Facility				
Gladding Parkway, Lincoln Boulevard, McCourtney Road – Stream Restoration And Culvert Improvement				
"O" Street Drainage Improvements				
7th Street Drainage Improvements				
Auburn Ravine at State Route 193 Bridge				
Auburn Ravine at State Route 65 Bridge				
Ingram Slough – Orchard Creek Return Channel				
Markham Ravine – Updated FEMA Analysis And Mapping				
Markham Ravine Drainage Improvements – Union Pacific Railroad & State Route 65 Crossings				
Auburn Ravine Stream Restoration Projects (Analysis and Repairs)				
Auburn Ravine Stream Restoration Projects (Analysis and Repairs)				
Coon Creek Streambed Restoration Projects (Analysis Only)				
Fire Prevention and Fuels Management Plan				
City of Rocklin				
Integrate Local Hazard Mitigation Plan into Safety Element of General Plan				
Federal Emergency Management Agency (FEMA) Floodplain/Community Rating System (CRS)				
Creek Channel and Drainage Way Clearing and Maintenance				
High Water Use Landscape and Irrigation Retrofit				
Open Space Fire Prevention & Vegetation Management Prescribed Grazing				
GIS Based Mapping of Pertinent Information that can be used by All Agencies in the Development of Plans and During Emergency Incidents				
Town of Loomis				
Integrate Local Hazard Mitigation Plan into Safety Element of General Plan				
Local Bridges Evaluation Program				
Address signage for property addresses				
Delmar Avenue Headwall Reconstruction Project				
Creek Maintenance Secret Ravine & Antelope Creek				
Reconstruction of Brace Bridge at Secret Ravine				
Raise Flood-Prone Houses Along Loomis Creeks				

Action Title	Complete	Ongoing	Not Yet Started	In 2021 Plan Update
Alta Fire Protection District				
Apparatus Water Fill & Drafting Location Improvements				
Evacuation / Reunification Center Improvements				
Natural Systems Protection / Education and Awareness Programs and Community Fuel Breaks				
Natural Systems Protection / Education and Awareness Programs				
Emergency Communications and Information System Improvements.				
Alta Fire Protection District CERT Team				
Reflective Addressing				
Alpine Springs County Water District				
Emergency Electrical Generator Replacement Project				
Water Storage Tank Replacement Project				
Mineral Springs Soil Bank Stabilization Project				
Alpine Meadows Consolidated Defensible Space Continuation Project				
Foresthills Fire Protection District				
Completion of Fuels Management Projects within the Foresthill/Iowa Hill Fire Safe Council, Greater Auburn Area Fire Safe Council and Placer Sierra Fire Safe Council Areas of the Western Slope of Placer County.				
Foresthill Biomass Project				
Assess and Enhance Foresthill Fire Protection District (FFPD) New Subdivision, Hazard Fuels Clearing and Maintenance Ordinance. Put Programs in Place with Homeowners Associations in CC&R's and Maintenance Contracts.				
Todd Valley Shaded Fuel Break				
Completion of Fuels Management Projects within the Foresthill/Iowa Hill Fire Safe Council, Greater Auburn Area Fire Safe Council and Placer Sierra Fire Safe Council Areas of the Western Slope of Placer County.				
Loomis Fire Protection District				
Identify and inspect ALL bridges in LFPD				
Vegetation Management for Open Areas				
Address Signs for Rural Residences				
Adopt 2016 CFC, CBC, and local standards				
Nevada Irrigation District				
Combie Phase 1 Replacement				
Centennial Water Storage and Power Supply Project				
Water Service Auburn Valley CSD				

Action Title	Complete	Ongoing	Not Yet Started	In 2021 Plan Update
NID Headquarters Office Generator				
Orr Creek Diversion				
Reservoir Cleaning				
Canal Culvert Replacement Program				
Northstar Community Services District				
Martis Landing Drainage Swales and Catch Basins				
Continue Easement Access Road Water Bar Maintenance and Replacement Program				
Fuels Reduction @ Sawmill Reservoir				
Fuels Reduction Program				
Storm Water Drainage Inlet Maintenance				
Siphon Line				
Provide Power from Mobile Generator				
Green Waste Recycling Program				
Enhance our current Defensible Space Program by seeking funding to hire a part-time employee to assist the Fire Prevention department in running this program				
District Water Conservation Program				
North Tahoe Fire Protection District				
FCC P-25 Interoperability Radio Systems				
District GIS Technology, Equipment, Database and Mapping Improvements				
North Tahoe Fire Protection District Critical Facility Infrastructure Improvements				
Seiche Wave Warning Systems, Signs and Public Education				
Defensible Space Inspection, Tree Marking, Chipping Program, and Public Education				
Hazardous Wood Roof Replacement Program				
Regional Water System Fire Protection Upgrades and Interoperability				
Skid Steer Loader with Transport Trailer, Fuels Reduction Masticator Attachment and Snow Blower Attachment				
Hydrant Risers, Replacements and Markers				
North Tahoe Public Utility District				
Update SCADA Equipment and Telecommunications Infrastructure				
IT and Telecommunications Improvements for Disaster Preparedness				
Update Emergency Response Plan				

Action Title	Complete	Ongoing	Not Yet Started	In 2021 Plan Update
Backup Generator Installation at Critical Facilities				
Fuels Reduction around Critical Infrastructure and North Tahoe Regional Park				
Kingswood West Subdivision Emergency Evacuation Access				
North Tahoe Regional Park Road Improvements for Emergency Access				
Seismic Study and Retrofit of Critical Infrastructure				
Sewer Main Replacements in Shorezone of Lake Tahoe				
Water Booster Pump Station Rehabilitation/Replacement				
Increased Storage Capacity for Dollar Cove Water System				
Water System Interties				
Placer County Flood Control District				
FEMA CTP DFIRM Mapping Study				
Pursue Regional Detention and Retention Projects within the Dry Creek and Cross Canal Watersheds				
Update Hydrology and Hydraulic Models within the Cross Canal Watershed				
Upgrade of Flood Warning System to Include Additional Gage Locations and Flood Forecasting Capabilities				
Placer County Water Agency				
Hillside Slope Stabilization				
LL Anderson Dam Spill Way Modification				
Water System Interties				
Vegetation Management and Brushing				
Enhance Canals by Converting Earthen Canals to Gunite-Lined Canals in Critical Areas				
Replace Wooden Flume Structures				
De-Silt Reservoirs.				
Placer Hills Fire Protection District				
Assess And Enhance Placer Hills Fire Protection District (PHFPD) Onsite Water Requirements For Minor Lot Splits				
South Placer Fire Protection District				
Vegetation Management for Open Areas				
Address Signs for Rural Residences				
Adopt 2016 CFC, CBC, and local standards				
Squaw Valley Public Service District				
Emergency Water Supply Interconnection to Martis Valley				
Truckee River Siphon				

Action Title	Complete	Ongoing	Not Yet Started	In 2021 Plan Update
Squaw Creek Siphon				
Easement Abatement/Maintenance of Emergency Access				
Develop a Community-Wide Emergency Notification System Capable of Providing Information to Both Residents and Visitors by Utilizing Permanent, Roadside Changeable Message Boards and a Low-Power Radio Transmitter

HVAC Control Upgrades				
Truckee Fire Protection District				
Community Wildfire Protection Plan				
Severe Winter Weather and Propane Issues Mainly in Serene Lakes				

Mitigation Strategy: Action (Implementation) Plan

The mitigation action plan describes how the mitigation actions will be implemented, including how those actions will be prioritized, administered, and incorporated into the community's existing planning mechanism. Each participating jurisdiction must have a mitigation action(s) and an action plan specific to that jurisdiction and its priority hazards and vulnerabilities.

Mitigation Criteria

For use in selecting and prioritizing Proposed Mitigation Measures

1. STAPLEE

Social: Does the measure treat people fairly? (different groups, different generations)

- Community Acceptance
- Effect on Segment of Population
- Social Benefits

Technical: Will it work? (Does it solve the problem? Is it feasible?)

- Technical Feasibility
- Reduce Community Risk
- Long Term Solution/Sustainable
- Secondary Impacts

Administrative: Do you have the capacity to implement & manage project?

- Staffing
- Funding Allocated
- Maintenance/Operations

Political: Who are the stakeholders? Did they get to participate? Is there public support? Is political leadership willing to support?

- Political Support
- Local Champion
- Public Support
- Achieves Multiple Objectives
- Supported by a broad array of Stakeholders

Legal: Does your organization have the authority to implement? Is it legal? Are there liability implications?

- Existing Local Authority
- State Authority
- Potential Legal Challenges

Economic: Is it cost-beneficial? Is there funding? Does it contribute to the local economy or economic development?

- Benefit of Action
- Cost of Action
- Cost Effective/Economic Benefits
- Economically Viable
- Outside Funding Required

Environmental: Does it comply with Environmental regulations?

- Effect on Land/Water
- Effect on Endangered Species
- Effect on Cultural Resources
- Effect on Hazmat sites
- Consistent with Community Environmental Goals
- Consistent with Environmental Laws
- Environmental Benefits

2. SUSTAINABLE DISASTER RECOVERY

- Quality of Life
- Social Equity
- Hazard Mitigation
- Economic Development
- Environmental Protection/Enhancement
- Community Participation

3. SMART GROWTH PRINCIPLES

- Infill versus Sprawl
- Efficient Use of Land Resources
- Full Use of Urban Resources
- Mixed Uses of Land
- Transportation Options
- Detailed, Human-Scale Design

4. OTHER

- Does measure address area with highest risk?
- Does measure protect ...
 - ✓ The largest # of people exposed to risk?
 - ✓ The largest # of buildings?
 - ✓ The largest # of jobs?
 - ✓ The largest tax income?
 - ✓ The largest average annual loss potential?
 - ✓ The area impacted most frequently?

- ✓ Critical Infrastructure (access, power, water, gas, telecommunications)
- Timing of Available funding
- Visibility of Project
- Community Credibility

Mitigation Action Prioritization (Voting) Instructions

The mitigation actions and projects will be further collated by hazard and will be presented back to the HMPC for prioritization. **An email link to the voting site will be launched Friday March 5th; voting will be open for a week and will close Friday March 12th.** The voting website location is <https://fostermorrison.aweeba.com/>.

Each person will have 9 votes total to vote for their preferred mitigation actions/projects:

- *3 high priority votes (5 points each)*
- *3 medium priority votes (3 points each)*
- *3 low priority votes (1 point each)*

Your votes will indicate the consensus of the team.

Use the list of mitigation selection criteria (above) to help you make your determinations.

After the votes are tabulated, we will send out an email detailing mitigation action prioritization results and next steps.

C.2 Mitigation Strategy Meetings – Action Prioritization

Placer County 2021 LHMP Update

Mitigation Strategy Meetings – Action Prioritization

50 Voting Members

Actions sorted by Vote Totals

Mitigation Action Title	Hazards Addressed	Points/ Worksheet Status
Backup power supply for critical facilities and infrastructure/Generator projects	Multi-Hazard	37
Community Wildfire Protection Plans (CWPP) – Implementation of Projects	Wildfire/Tree Mortality	36
Fire Prevention and Fuels Management Plan	Wildfire/Tree Mortality	35
Continue to implement, and update as necessary, the Strategic Plan for Placer County Wildfire Protection and Biomass Utilization Program to seek ways to reduce the efforts of catastrophic wildfires, and convert unwanted woody biomass to produce heat and/or electrical power, alternative transportation fuels, or beneficial bio-based chemicals and products.	Wildfire/Tree Mortality	30
Critical Facility Infrastructure Improvements	Multi-Hazard	30
Fuel reduction projects	Wildfire/Tree Mortality	29
Open Space fire prevention & vegetation management prescribed grazing	Wildfire/Tree Mortality	29
Defensible space inspection, tree marking, chipping program and public education	Wildfire/Tree Mortality	27
Expand the county's capacity to restore conifer forest health on private and public lands, which includes active management to reduce fire risk, including removal and disposal of diseased trees and other fuels. Work with public and private partners to identify appropriate locations for mills, biomass facilities, or other facilities that support the reuse of trees for other uses, including composting and renewable energy.	Wildfire/Tree Mortality	26
Implement the actions contained within the Placer County Climate Adaptation Plan	Climate Change	24
Work with telecommunication companies to install fiber-optic infrastructure allowing for faster and higher-capacity broadband internet, including telecommunication systems that can be used to more effectively distribute emergency communications and alerts to members of the public	Multi-Hazard	24
Construct additional water storage facilities and improve existing facilities to augment surface and groundwater supplies for agricultural uses while continuing to provide ecosystem protections	Agricultural Hazard/Drought	22
Implement the actions contained within the Placer County Sustainability Plan	Climate Change	21

Mitigation Action Title	Hazards Addressed	Points/ Worksheet Status
Chipper program	Wildfire/Tree Mortality	21
Vegetation management – Ongoing maintenance of fuel breaks	Wildfire/Tree Mortality	21
Water source redundancy and reliability projects	Drought and Water Shortage	20
McBean Park Drive: Auburn Ravine bridge – additional 110' Span	Flood	20
Lakeview Farms regional volumetric mitigation facility	Flood	20
Water system intertie projects and connections	Drought and Water Shortage	19
Defensible space program	Wildfire/Tree Mortality	19
Establish a Biomass Facility – fixed/portable	Wildfire/Tree Mortality	19
Expand broadband/wifi access	Multi-Hazard	18
Develop an Avalanche Risk Reduction and Response Plan (multi-agency) for Placer County	Avalanche	17
Establish emergency water supply interconnections	Drought and Water Shortage	17
Implement organics waster (food and green waste) reduction/recycling programs to reduce emissions from the decomposition of organic waste in the landfill (organics creates methane, which contributes to climate change; Cal Recycle requires 75% reduction by 2025)	Climate Change	16
Vegetation management projects	Wildfire/Tree Mortality	16
Enhance public education and awareness of natural hazards and public understanding of disaster preparedness	Multi-Hazard	16
Increase broadband systems and access	Pandemic	15
Continue to support new FireWise communities/conduct FireWise community inspections	Wildfire/Tree Mortality	15
Explore creating wildfire abatement districts to provide fuel-clearing services and maintenance of defensible space on public and private land within the county.	Wildfire/Tree Mortality	15
Drainage improvement projects	Flood	14
Large strategic fuel breaks, including those in the Wildland Urban Interface (WUI) areas	Wildfire/Tree Mortality	14
Evacuation planning countywide	Multi-Hazard	14
Noxious weed eradication programs	Agricultural Hazard	13
Ensure that County facilities used as cooling centers are equipped with backup power supplies, including on-site renewable energy generation and energy storage systems as feasible	Severe Weather: Heat	13

Mitigation Action Title	Hazards Addressed	Points/ Worksheet Status
Home hardening projects	Wildfire/Tree Mortality	13
Pest detection programs	Agricultural Hazard	12
Enhance programs and improve capabilities/efficiency to receive/recycle green waste	Climate Change	12
FEMA CTP DFIRM mapping study	Flood	12
Undergrounding of utilities	Severe Weather: All	12
Improve water systems for suppression and resiliency against wildfires	Wildfire/Tree Mortality	12
Identify/support new or expanded fuel reduction projects, including those that provide assistance for biomass facilities.	Wildfire/Tree Mortality	12
Work with stakeholders to develop a pilot project on private or public land that demonstrates the cost-savings of treating and managing land for wildfire prevention in relation to air quality and other ecosystem services. The project could consider both direct (i.e. homes and roadways) and indirect costs (i.e. social capital and air quality), the costs of management and prevention compared to the costs of no action and recovery, and the emission reduction potential of good forest management to the extent possible.	Wildfire/Tree Mortality	11
GIS based mapping of pertinent information that can be used by all agencies in the development of plans and during emergency incidents	Multi-Hazard	11
Increase soil organic matter to improve soils' water-holding capacity, soil structure, and water infiltration, and to reduce erosion (use cover crops and mixes, native grasses, crop or livestock residues, compost, mulch, biochar, or other organic amendments)	Drought and Water Shortage	10
Lincoln Boulevard: Auburn Ravine bridge – reconstruct bridge	Flood	10
Auburn Ravine stream restoration projects	Flood	10
Wildfire smoke impact response – education and outreach	Wildfire/Tree Mortality	10
Integrate Local Hazard Mitigation Plan into Safety Element of General Plan	Multi-Hazard	10
Interoperability radio systems	Multi-Hazard	10
Develop Climate Adaptation Plan	Climate Change	9
Sedimentation removal from reservoirs	Dam Failure	9
Floodproofing utilities and critical facilities and infrastructure	Flood	9
Repair and replace lift stations	Flood	9
Prescribed burns	Wildfire/Tree Mortality	9
Fuel reduction for previously burned areas	Wildfire/Tree Mortality	9
Explore the feasibility of installing a microgrid at the Placer County Government Center for backup power and evaluate the feasibility of microgrids in Tahoe or Foresthill to provide emergency response and economic resiliency.	Multi-Hazard	9

Mitigation Action Title	Hazards Addressed	Points/ Worksheet Status
Conduct seismic evaluation and retrofits of public buildings and critical facilities and infrastructure	Earthquake	8
Stream and creek channel and drainage way clearing and maintenance projects	Flood	8
Natural Systems Protection / Education and Awareness Programs – Placer County Wildland Urban Interface (WUI) Strategic Planning	Wildfire/Tree Mortality	7
Install piezometers in earthen dams	Dam Failure/ Earthquake	6
Increase the use of permeable surfaces and rainwater catchment/retention systems in developed areas to enhance groundwater recharge	Drought and Water Shortage	6
Support the West Placer Groundwater Sustainability Agency’s efforts to develop a Groundwater Sustainability Plan in accordance with state regulations	Drought and Water Shortage	6
Water tank earthquake retrofit project	Earthquake	6
Bridge and culvert replacement projects	Flood	6
Auburn Ravine at State Route 193 Bridge	Flood	6
Upgrade of flood warning systems to include additional gage locations and flood forecasting capabilities	Flood	6
Update hydrology and hydraulic models within the Cross Canal Watershed	Flood	6
Conduct avalanche mitigation in high risk areas	Avalanche	5
Foresthill Transfer Station – Increase the amount of tipping bays for green waste to improve efficiency.	Climate Change	5
Explore ways to improve the storage capacity and generation efficiency at PCWA/County hydroelectric power plants and to increase installation of small-scale hydroelectric facilities. Identify areas appropriate for small-scale hydroelectric facilities	Climate Change	5
Spillway projects to control the flow of water	Dam Failure	5
Water booster pump station rehabilitation/replacement	Drought and Water Shortage	5
Installation of SCADA systems	Flood	5
Pursue regional detention and retention projects within the Dry Creek and Cross Canal Watershed	Flood	5
Conduct structural retrofits of at-risk bridges to protect against flooding and landslides/debris flows. Emphasize bridges with lower stability ratings and higher traffic counts. E.g., Edgewood Road over Wise Canal and Dry Creek Road over Rock Creek	Flood/Landslide	5
Develop a communitywide emergency notification system capable of providing information to both residents and visitors by utilizing permanent, roadside changeable message boards and a low power transmitter	Multi-Hazard	5
IT and telecommunications improvements for disaster preparedness	Multi-Hazard	5
In coordination with utility companies, explore replacing streetlights with new models, or augmenting existing streetlights with additional features, allowing them to act as public Wi-Fi beacons, traffic counters, and relay stations for public emergency alerts. Prioritize development of smart street lights in the Tahoe Basin	Multi-Hazard	5

Mitigation Action Title	Hazards Addressed	Points/ Worksheet Status
Update the Emergency Operations Plan to include dam failure events	Dam Failure	4
Groundwater recharge projects	Drought and Water Shortage	4
Squaw Creek siphon	Drought and Water Shortage	4
Increased Storage Capacity for Dollar Cove Water System	Drought and Water Shortage	4
Elevate remaining 95 homes in the Dry Creek Watershed	Flood	4
Enhance/continue weed abatement ordinance/hazardous vegetation ordinance	Wildfire/Tree Mortality	4
Hydrant risers, replacements, and markers	Wildfire/Tree Mortality	4
GIS technology, equipment, database, and mapping improvements	Multi-Hazard	4
Local air quality sensors to provide instantaneous public information on local PM concentrations due to wildfire smoke	Multi-Hazard	4
Conduct ongoing public outreach about water conservation programs throughout Placer County	Drought and Water Shortage	3
Canal culvert replacement program	Flood	3
Ensure that wastewater infrastructure in flood-prone areas is hardened to minimize the risk of overflow	Flood	3
Erosion repair and control projects	Flood	3
Best Management Practices (BMP) implementation	Flood	3
Coon Creek streambed restoration projects	Flood	3
Urban level of flood protection mapping	Flood	3
Stormwater drainage inlet maintenance	Flood	3
Increase resiliency of single-access roads and trails (particularly popular trails and those that could provide access to isolated communities if the primary road is damaged or inaccessible) to flooding by improving drainage systems, increasing roadbed height, and other protective steps as feasible and appropriate	Flood	3
North Fork American River fuel break	Wildfire/Tree Mortality	3
Establish underground waterlines for delivery to fire hydrants	Wildfire/Tree Mortality	3
Improve access to canals and ditches by emergency vehicles to access water for fire fighting	Wildfire/Tree Mortality	3
Replace wooden flume structures	Wildfire/Tree Mortality	3
Coordinate with the California Department of Housing and Community Development, mobile home park owners, and mobile home tenants in wildfire hazard zones to reduce fuel availability and maximize defensible space.	Wildfire/Tree Mortality	3
New flood/hydrology related studies should factor climate change into models to accommodate future floods events	Climate Change	2

Mitigation Action Title	Hazards Addressed	Points/ Worksheet Status
Provide education and outreach on organic waste and GHG emissions	Climate Change	1
Increase access to organics recycling and edible food recovery capacity	Climate Change	1
Sewer main replacements in Shorezone of Lake Tahoe	Drought and Water Shortage	1
Elevate repetitive loss structures in 100-year floodplain	Flood	1
Relocation of 36" sewer line that crosses the Truckee River below Lake Tahoe. (The river water level reaches this pipe at a release of 2000 cfs from Lake Tahoe)	Flood	1
Auburn Ravine at State Route 65 Bridge	Flood	1
HVAC system upgrades	Pandemic	1
Place warning signage in key areas around Lake Tahoe	Seiche	1
Using cool roofing products that reflect sunlight and heat away from buildings	Severe Weather: Heat	1
Regional water system fire protection upgrades and interoperability	Wildfire/Tree Mortality	1
Work with dam owners to maintain all dams in Placer County to a high degree of structural integrity	Dam Failure/ Earthquake	0
Enhance canals by converting earthen canals to gunite-lined canals in critical areas	Drought and Water Shortage	0
Develop a rebate program for greywater and rainwater catchment systems	Drought and Water Shortage	0
West Lake Tahoe regional water treatment plant	Drought and Water Shortage	0
Community Rating System (CRS) - maintain and enhance	Flood	0
Develop/update/implement stormwater master plans	Flood	0
Raise/relocate utilities out of the floodplain/above base flood elevation	Flood	0
Elevate roads above base flood elevation to maintain dry access	Flood	0
Gladding Parkway, Lincoln Boulevard, McCourtney Road – Stream restoration and culvert improvement	Flood	0
"O" Street drainage improvements	Flood	0
7th Street drainage improvements	Flood	0
Ingram Slough – Orchard Creek return channel	Flood	0
Markham Ravine – Updated FEMA analysis and mapping	Flood	0
Markham Ravine drainage improvements – Union Pacific Railroad & State Route 65 crossings	Flood	0
Conduct regular cleaning and maintenance of storm drains along key roadways, especially in advance of the rainy season. Improve storm drain capacity in areas where ponding is regularly observed	Flood	0
Siphon lines	Flood	0
Annually distribute flood protection safety pamphlets to educate citizens about safety during flood conditions, including the dangers of driving on flooded roads	Flood	0

Mitigation Action Title	Hazards Addressed	Points/ Worksheet Status
Hillside Slope Stabilization	Flood/Landslide	0
Install warning/siren system	Seiche	0
Severe Weather Annex update and revision	Severe Weather: All	0
Increase tree plantings around buildings to shade parking lots and along public rights-of-way	Severe Weather: Heat	0
Fuel reduction around critical infrastructure and North Tahoe Regional Park	Wildfire/Tree Mortality	0
Shaded fuel break along west shore of Folsom Lake – Granite Bay	Wildfire/Tree Mortality	0
Evaluate the need and feasibility of improving fire prevention for the historic business districts	Wildfire/Tree Mortality	0
Acquire skid steer loader with transport trailer, fuels reduction masticator/snow blower attachment	Wildfire/Tree Mortality	0
Easement abatement/maintenance of emergency access areas	Wildfire/Tree Mortality	0
North Tahoe Regional Park road improvements for emergency access	Multi-Hazard	0

C.3 Categories of Mitigation Measures Considered

The following categories of mitigation measures are based on the Community Rating System.

- Prevention
- Property Protection
- Natural Resource Protection
- Emergency Services
- Structural Projects
- Public Information

C.4 Placer County Analysis of Alternative Mitigation Measures per Category

Note: This review of mitigation measures is in compliance with the FEMA's nationally accepted six mitigation categories and FEMA's CRS Program requirement to provide a comprehensive evaluation of the six mitigation categories with a specific requirement that Preventative Measures be thoroughly reviewed. This review leads to the projects incorporated into the mitigation strategy action plan.

C.4.1. Preventive Measures

Preventive measures are designed to keep a problem - such as flooding - from occurring or from getting worse. The objective of preventive measures is to ensure that future development is not exposed to damage and does not cause an increase in damages to other properties. Building, zoning, planning and code enforcement offices usually administer preventive measures. Some examples of types of preventive measures include:

- Building codes and floodplain regulations
- Comprehensive land use planning, zoning, and open space preservation
- Stormwater management and subdivision regulations

Building Codes

Building codes provide one of the best methods of addressing natural hazards. When properly designed and constructed according to code, the average building can withstand many of the impacts of natural hazards. Hazard protection standards for all new and improved or repaired buildings can be incorporated into the local building code. Building codes can ensure that the first floors of new buildings are constructed to be higher than the elevation of the 100-year flood (the flood that is expected to have a one percent chance of occurring in any given year). This is shown in Figure 0-1.

Figure 0-1 Building Codes and Flood Elevations

Floodplain Regulations

Most communities with a flood problem participate in the National Flood Insurance Program (NFIP). The NFIP sets minimum requirements for the participating communities' standards for development, subdivision of land, construction of buildings, installation of mobile homes, and improvements and repairs to buildings. These are usually spelled out in a separate ordinance.

The NFIP minimum requirements are summarized below. It should be stressed that these are minimum requirements. Local conditions, such as high velocity flooding or the presence of a potential dam failure, may warrant higher local standards.

Enforcement

To ensure that communities are meeting the NFIP standards, FEMA periodically conducts a Community Assessment Visit. During this visit, the maps and ordinances are reviewed, permits are checked, and issues are discussed with staff. Failure to meet all of the requirements can result in one or more consequences:

- Reclassification under the Community Rating System to a higher class
- Probation, which entails a \$50 surcharge on every flood insurance policy in the community, or
- Suspension from the NFIP.

Suspension is the most serious. It means that the community is out of the NFIP and the following sanctions are imposed:

- Flood insurance will not be available. No resident will be able to purchase a flood insurance policy.
- Existing flood insurance policies will not be renewed.
- No direct federal grants or loans for development may be made in identified flood hazard areas under programs administered by federal agencies, such as HUD, EPA, and the Small Business Administration.
- Federal disaster assistance will not be provided to repair insurable buildings located in identified flood hazard areas for damage caused by a flood.
- No federal mortgage insurance or loan guarantees may be provided in identified flood hazard areas. This includes policies written by FHA, VA, and others.
- Federally insured or regulated lending institutions, such as banks and credit unions, must notify applicants seeking loans for insurable buildings in flood hazard areas that there is a flood hazard and the property is not eligible for federal disaster relief.

These sanctions can be severe for any community with a substantial number of buildings in the floodplain. Most communities with a flood problem have joined the NFIP and are in full compliance with their regulatory obligations.

One way to assure good administration and enforcement is to have Certified Floodplain Managers on staff. The Association of State Floodplain Managers administers the national Certified Floodplain Manager (CFM®) program.

Minimum National Flood Insurance Program Regulatory Requirements

The National Flood Insurance Program (NFIP) is administered by the Federal Emergency Management Agency (FEMA). As a condition of making flood insurance available for their residents, communities that participate in the NFIP agree to regulate new construction in the area subject to inundation by the 100-year (base) flood. The floodplain subject to these requirements is shown as an A or V Zone on the Flood Insurance Rate Map (FIRM).

There are five major floodplain regulatory requirements. Additional floodplain regulatory requirements may be set by state and local laws.

1. All development in the 100-year floodplain must have a permit from the community. The NFIP regulations define "development" as any manmade change to improved or unimproved real estate, including but not limited to buildings or other structures, mining, dredging, filling, grading, paving, excavation or drilling operations or storage of equipment or materials.
2. Development along a river or other channel cannot obstruct flows so as to cause an increase in flooding on other properties. An analysis must be conducted to demonstrate that the cumulative effect of the proposed development, when combined with all other existing and anticipated development, will not increase the water surface elevation of the base flood more than one foot at any point within the community.
3. New buildings may be built in the floodplain, but they must be protected from damage from the base flood. In riverine floodplains, the lowest floor of residential buildings must be elevated to be at or above the base flood elevation (BFE). Nonresidential buildings must be either elevated or floodproofed.

4. Under the NFIP, a "substantially improved" building is treated as a new building. The NFIP regulations define "substantial improvement" as any reconstruction, rehabilitation, addition, or other improvement of a structure, the cost of which equals or exceeds 50% of the market value of the structure before the start of construction of the improvement. This requirement also applies to buildings that are substantially damaged.
5. Communities are encouraged to adopt local ordinances that are more comprehensive or provide more protection than the federal criteria. The NFIP's Community Rating System provides insurance premium credits to recognize the additional flood protection benefit of higher regulatory standards.

Local Implementation

Placer County has adopted the 2019 California Building Code based on the 2018 International Building Code. Placer County has Floodplain Damage Prevention Regulations that exceed minimum NFIP standards and implement floodplain regulations that include some higher regulatory standards.

Just as important as having code standards is the enforcement of the code. Adequate inspections are needed during the course of construction to ensure that the builder understands the requirements and is following them. Making sure a structure is properly elevated and anchored requires site inspections at each step.

Reduce Future Flood Losses

Future flood losses should be reduced by enforcement of current floodplain regulations. For new residential construction and substantial improvement, Placer County requires that the lowest floor be elevated a minimum of one foot above the base flood elevation. It is recommended that the finish floor be a minimum of two feet above the base flood elevation in order to prevent inundation of floor joists, insulation and other appurtenant components located on the underside of the finish floor. Non residential construction shall either be elevated to conform to the residential standard or be floodproofed so that below the base flood level the structure is watertight, "with walls substantially impermeable to the passage of water and with structural components having the capability of resisting hydrostatic and hydrodynamic loads and effects of buoyancy." This reduces future flood losses by keeping development out of known floodplains. This is done by enacting and enforcing the current standards and/or adopting higher regulatory standards.

Current Standards

As mentioned above, Placer County has Flood Damage Prevention Regulations that meet all of the NFIP's minimum floodplain regulatory requirements and exceed some of them such as establishing one foot of freeboard. Their regulations include methods and provisions for:

- Restricting or prohibiting uses which are dangerous to health, safety, and property due to water or erosion hazards, or which result in damaging increase in erosion or flood heights or velocities;
- Requiring that uses vulnerable to floods, including facilities which serve such uses, be protected against flood damage at the time of initial construction;
- Controlling the alteration of natural floodplains, stream channels, and natural protective barriers, which help accommodate or channel floodwaters;
- Controlling fill, grading, dredging, and other development which may increase flood damage; and
- Preventing or regulating the construction of flood barriers which will unnaturally divert floodwaters or which may increase flood hazards in other areas.

In addition, all new construction or substantial improvements shall be:

- Designed or modified and adequately anchored to prevent flotation, collapse or lateral movement of the structure resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy
- Constructed in ways that minimize flood damage
- Constructed with materials resistant to flood damage
- Constructed with electrical, heating, ventilation, plumbing, and air conditioning equipment and other service facilities designed or located so as to prevent water from entering or accumulating within components during flooding

Placer County also requires that:

- All new and replacement water supply and sanitary sewage systems shall be designed to minimize or eliminate infiltration of floodwaters into the system and discharge from systems into floodwaters.
- On-site waste disposal systems shall be located to avoid impairment to them or contamination from them during flooding.

Placer County also has regulations that exceed minimum NFIP standards. These include:

- Floodways are delineated and certain requirements apply to construction within these floodways so as to not result in any increase in flood levels during the occurrence of the base flood discharge.
- Requiring new construction and substantial improvements to have the lowest flood, including basement, elevated a minimum of one foot above the base flood elevation.
- All building permit applicants who may be located in Flood Zone A must have a California registered engineer prepare an engineering study including an evaluation of the building site, determination as to whether the structure will be located in a 100-year flood zone and supporting flood data.
- Restrictions and standards are included on the use of enclosures below elevated buildings.

In addition, Placer County's floodplain management program is implemented by Certified Floodplain Managers on staff with the County's Department of Public Works Stormwater and Floodplain Programs.

Manufactured Homes

Manufactured or mobile homes are usually not regulated by local building codes. They are built in a factory in another state and are shipped to a site. They do have to meet construction standards set by the U.S. Department of Housing and Urban Development. All mobile homes constructed after 1976 must comply with HUD's National Manufactured Home Construction and Safety Standards. These standards apply uniformly across the country and it is illegal for a local unit of government to require additional construction requirements. Local jurisdictions may regulate the location of these structures and their on-site installation.

Local Implementation

Placer County requires that all manufactured homes that are placed or substantially improved within a special flood hazard area on the community's Flood Insurance Rate Map: (1) outside of a manufactured home park or subdivision, (2) in a new manufactured home park or subdivision, (3) in an expansion to an existing manufactured home park or subdivision, (4) in an existing manufactured home park or subdivision on which a manufactured home has incurred "substantial damage" as the result of a flood: will be elevated on a permanent foundation such that the lowest floor of the manufactured home is elevated to a minimum

of one foot above the base flood elevation and be securely anchored to an adequately anchored foundation system to resist flotation collapse and lateral movement. All manufactured homes to be placed or substantially improved on sites in an existing manufactured home park or subdivision on the community's Flood Insurance Rate Map that are not subject to the provisions of subsection A of this section will be elevated so that either: 1) The lowest floor of the manufactured home is a minimum of one foot above the base flood elevation; or 2) The manufactured home chassis is supported by reinforced piers or other foundation elements of at least equivalent strength that are no less than thirty-six (36) inches in height above grade and be securely anchored to an adequately anchored foundation system to resist floatation, collapse, and lateral movement.

CRS Credit

Building Codes: The CRS encourages strong building codes. It provides credit in two ways: points are awarded based on the community's BCEGS classification and points are awarded for adopting the International Code series. Placer County's BCEGS rating is a Class 2 for both residential and commercial. Placer County uses the 2019 California Building Code.

The CRS also has a prerequisite for a community to attain a Class 6 or better within the CRS program, the community must have a BCEGS class of 5/5 or better. To attain a Class 4 or better in the CRS program, the community must have a BCEGS class of 4/4 or better. Placer County has a BCEGS classification of 2/2. Placer County has also adopted the 2018 International Code series.

The National Flood Insurance Program's (NFIP) Community Rating System (CRS) was implemented in 1990 as a program for recognizing and encouraging community floodplain management activities that exceed the minimum NFIP standards. The National Flood Insurance Reform Act of 1994 codified the Community Rating System in the NFIP.

- The CRS recognizes 18 creditable activities, organized under four categories numbered 300 through 600:
 - ✓ Public Information
 - ✓ Mapping and Regulations
 - ✓ Flood Damage Reduction
 - ✓ Flood Preparedness
- Placer County participates in the Community Rating System (CRS) of the National Flood Insurance Program.
- By implementing these floodplain management activities, the residents of Placer County can qualify for a flood insurance premium rate reduction. When communities go beyond the minimum standards for floodplain management, the CRS can provide discounts up to 45% off flood insurance premiums.

The County of Placer is currently a Class 5 community, which provides a 25% discount on flood insurance to properties located in the Special Flood Hazard Area.

Floodplain management regulations: There are many higher regulatory standards that warrant CRS credit. These standards include:

- Delineating a floodway, the area of higher hazard near the channel. This would allow development outside the floodway (called the "floodplain fringe") without engineering studies to determine their impact on others.

- Requiring all new construction to be elevated one or two feet above the base flood elevation to provide an extra level of protection from waves and higher floods. This extra protection is reflected in a distinct reduction in flood insurance rates.
- Having all developers (not just the larger ones) provide flood data where none are available.
- Specifications to protect foundations from erosion, scour and settling.
- Prohibiting critical facilities from all or parts of the floodplain.
- Prohibiting hazardous materials.
- Requiring buffers adjacent to streams or natural areas.
- Restrictions on use of enclosures below elevated buildings.
- Flood storage lost due to filling and construction must be compensated for by removal of an equal volume of storage.
- The CRS also provides credit for having trained staff and a higher credit if the staff members are Certified Floodplain Managers.

It should be noted that one of the prerequisites for participation in the CRS is that the community be in full compliance with the minimum requirements of the NFIP. A community with a number of "potential violations" risks being removed from the CRS entirely.

Manufactured homes: The NFIP allows communities to exempt mobile homes in existing mobile home parks from some of the flood protection requirements. The CRS provides up to 50 points if the community does not use this exemption.

Comprehensive Land Use Planning, Zoning, and Open Space Preservation

Building codes provide guidance on how to build in hazardous areas. Planning and zoning activities direct development away from these areas, particularly floodplains and wetlands. They do this by designating land uses that are compatible with the natural conditions of land that is prone to flooding, such as open space or recreation. Planning and zoning activities can also provide benefits by simply allowing developers more flexibility in arranging improvements on a parcel of land through the planned development approach.

General and Comprehensive Plans

These plans are the primary tools used by communities to address future development. They can reduce future flood-related damages by indicating open space or low density development within floodplains and other hazardous areas. Unfortunately, natural hazards are not always emphasized or considered in the specific land use recommendations.

Generally, a plan has limited authority. It reflects what the community would like to see happen. Its utility is that it guides other local measures, such as capital improvement programs, zoning ordinances, and subdivision regulations.

Capital Improvement Plans

A capital improvement plan can guide a community's major public expenditures for a 5- to 20-year period. Capital expenditures may include acquisition of open space within the hazardous areas, extension of public services into hazardous areas, or retrofitting existing public structures to withstand a hazard.

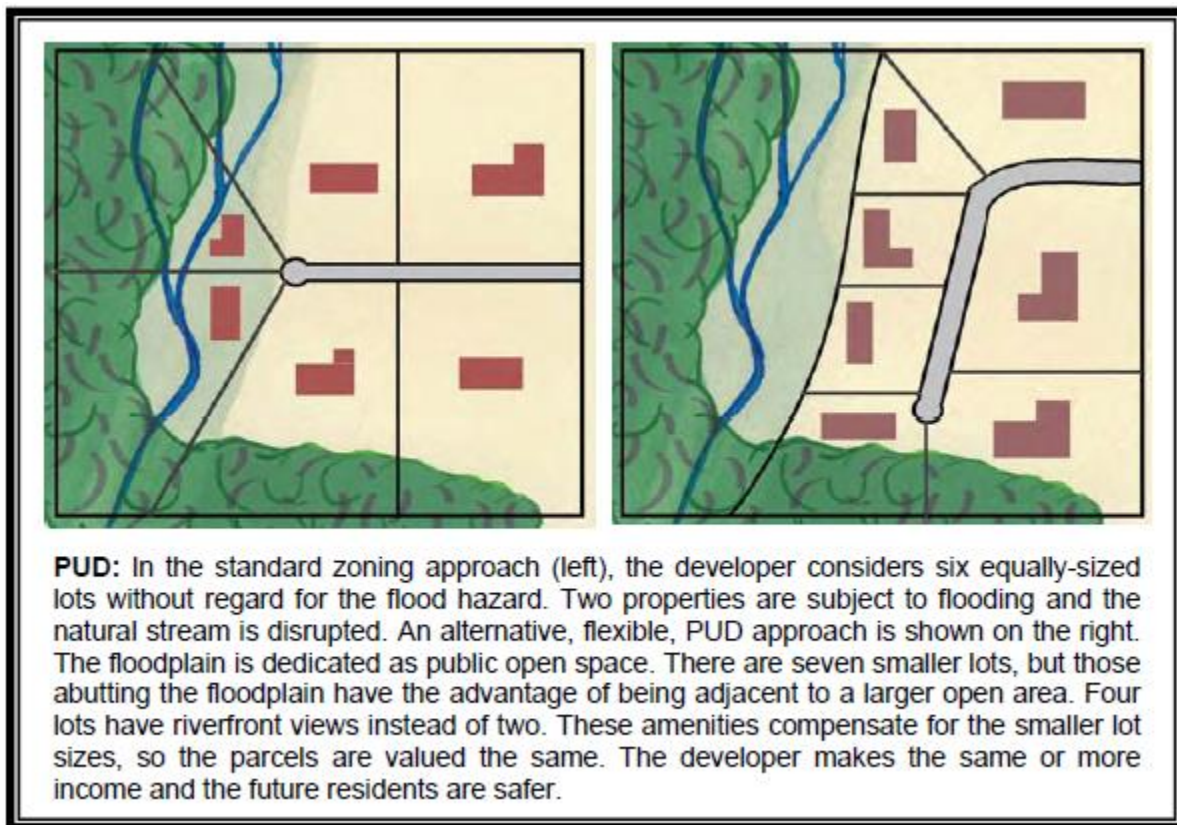

Zoning

A zoning ordinance regulates development by dividing a community into zones or districts and setting development criteria for each of those zones or districts. Zoning codes are considered the primary tool to implement a general/comprehensive plan's guidelines for how land should be developed.

Zoning ordinances can limit development in hazardous areas, such as reserving floodplain zones for agricultural uses. Often, developers will produce a standard grid layout. The ordinance and the community can allow flexibility in lot sizes and location so developers can avoid hazardous areas.

One way to encourage such flexibility is to use the planned unit development (PUD) approach or cluster development. The PUD and cluster approach's allows the developer to easily incorporate flood hazard mitigation measures into the project. Open space or floodplain preservation can be facilitated as site design standards and land use densities can be adjusted to fit the property's specific characteristics, as shown in Figure 0-2.

Figure 0-2 Zoning for Development in the Floodzone

Open Space Preservation

Keeping the floodplain and other hazardous areas open and free from development is the best approach to preventing damage to new developments. Open space can be maintained in agricultural use or can serve as parks, greenway corridors and golf courses.

Comprehensive and capital improvement plans should identify areas to be preserved by acquisition and other means, such as purchasing an easement. With an easement, the owner is free to develop and use private property, but property taxes are reduced or a payment is made to the owner if the owner agrees to not build on the part set aside in the easement.

Although there are some federal programs that can help acquire or reserve open lands, open space lands and easements do not always have to be purchased. Developers can be encouraged to dedicate park land and required to dedicate easements for drainage and maintenance purposes. These are usually linear areas along property lines or channels. Maintenance easements also can be donated by streamside property owners in return for a community maintenance program.

Local Implementation

General Plan: On May 21, 2013, Placer County adopted their new General Plan. As part of the 2013 General Plan update, the County revised the standards pertaining to new flood protection requirements. This included changes to the Safety Element and other areas of the General Plan and includes the introduction of the term “County Regulatory Floodplains” that includes both the 100-year FEMA floodplain and the 200-year floodplain. No update to the flood damage prevention ordinance is required since current regulations already regulate projects in the regulatory floodplain. Under this program the County is also considering the 200-year storm when reviewing projects.

Zoning and Open Space Preservation: Placer County’s General Plan, in coordination with the local Codes, protects current open space. In addition, the General Plan includes a statement:

The County shall support the preservation and enhancement of natural land forms, natural vegetation, and natural resources as open space to the maximum extent feasible. The County shall permanently protect, as open space, areas of natural resource value, including wetlands, riparian corridors, unfragmented woodlands, and floodplains.

Reduce Future Flood Losses

Enacting the General Plans and the comprehensive zoning and future land uses contained in the County General Plan will help to reduce future flood losses by helping to keep development out of hazardous areas and known floodplains.

Current Standards

Placer County’s zoning codes do not provide for any additional restrictions on development in floodplains, aside from what is required under each jurisdiction’s floodplain regulations regarding building standards for floodplains.

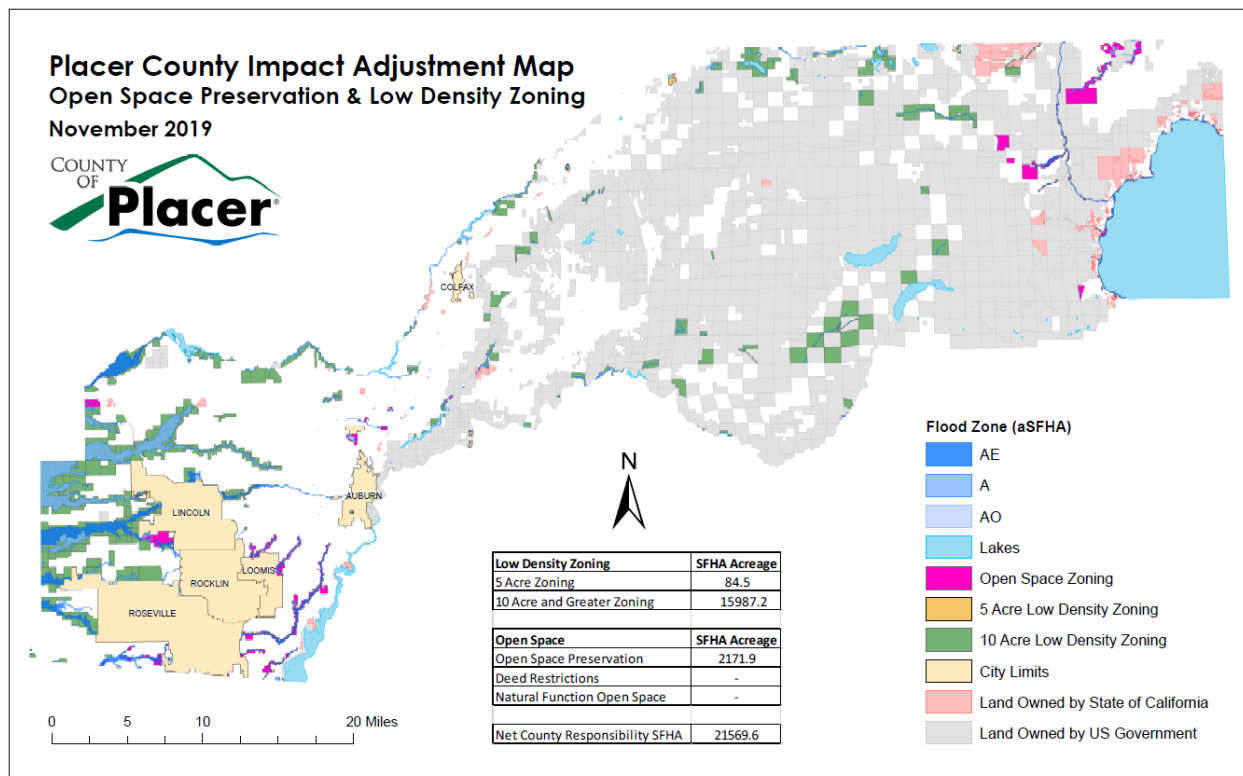

CRS Credit

The CRS provides flood insurance discounts to those communities that implement various floodplain management activities that meet certain criteria. Comparing local activities to those national criteria helps determine if local activities should be improved.

Credits are provided for regulations that encourage developers to preserve floodplains or other hazardous areas from development. There is no credit for a plan, only for the enforceable regulations that are adopted pursuant to a plan. Credits are also provided for setting aside floodplains for low density zoning, such as five acre lots or conservation. The County has placed zoning requirements within floodplain areas that are for low density development, open space and deed restrictions.

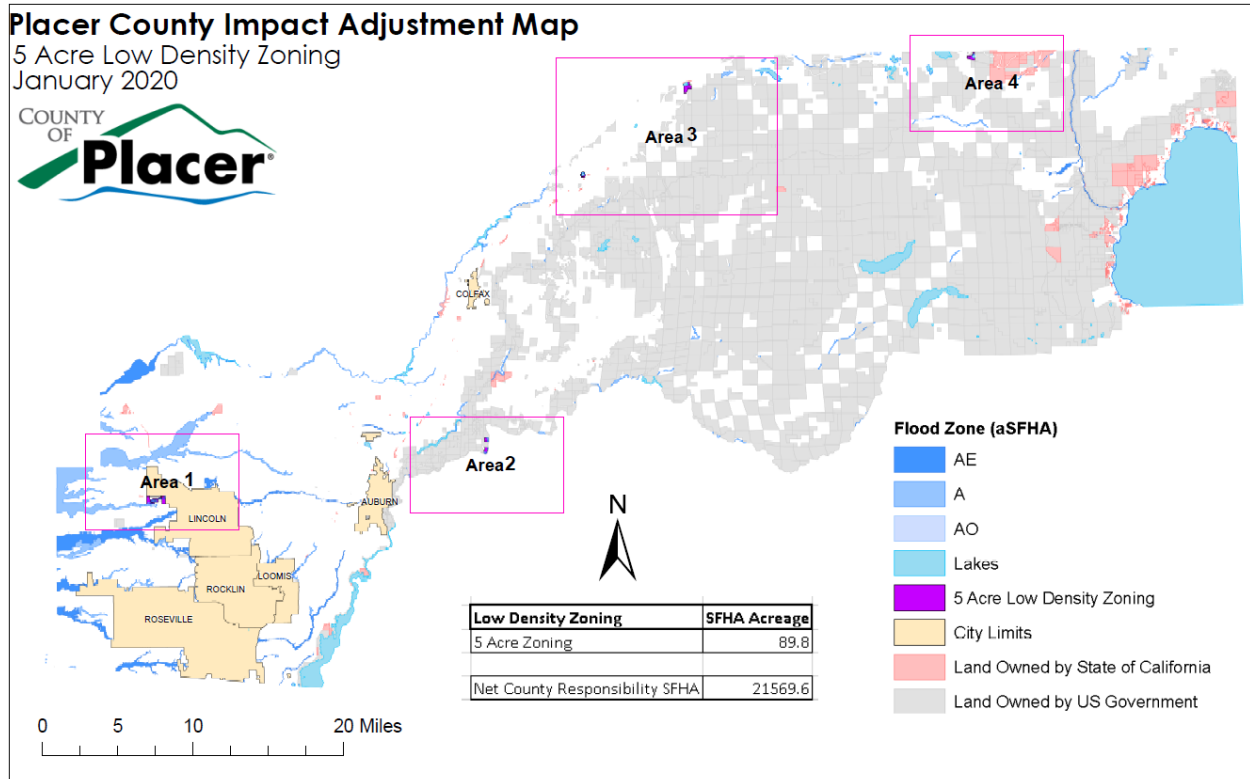

Preserving flood prone areas as open space is one of the highest priorities of the Community Rating System. Up to 1,450 points can be given, based on how much of the floodplain is in community public undeveloped properties, parks, wildlife refuges, golf courses, or other uses that can be depended on to stay open (Activity 420 - Open Space Preservation). Placer County has over 2000 acres designated as open space zoning within the SFHA. See Figure 0-3 for these areas. Figures C-5 and C-6 show additional information for areas of low density zoning.

Stormwater Management and Subdivision Ordinance

Development in floodplains is development in harm's way. New construction in the floodplain increases the amount of development exposed to damage and can aggravate flooding on neighboring properties.

Development outside a floodplain can also contribute to flooding problems. Stormwater runoff is increased when natural ground cover is replaced by urban development (see Figure 0-4). Development in the watershed that drains to a river can aggravate downstream flooding, overload the community's drainage system, cause erosion, and impair water quality.

Figure 0-4 Runoff and Infiltration of Natural and Developed Land

There are three ways to prevent flooding problems caused by stormwater runoff:

- Regulating development in the floodplain to ensure that it will be protected from flooding and that it won't divert floodwaters onto other properties, and
- Regulating all development to ensure that the post-development peak runoff will not be greater than it was under pre-development conditions.
- Set construction standards so buildings are protected from shallow water.

Most communities participate in the NFIP, which sets minimum requirements for regulating development in the floodplain. All new buildings must be protected from the base or 100-year flood and no development can cause an increase in flood heights or velocities.

Stormwater runoff regulations require developers to build retention or detention basins to minimize the increases in the runoff rate caused by impervious surfaces and new drainage systems. Generally, each

development must not let stormwater leave at a rate higher than what existed under pre-development conditions.

Standards for drainage requirements are typical in subdivision regulations. Standards for storm sewers, ditches, culverts, etc., are best set when an area is laid out and developed. Traditionally, the national standard is to require that the local drainage system carry the 10-year storm. Recently, communities are finding that older estimates of the 10-year storm understated the true hazard, so they are addressing larger storms.

One problem with requiring the drainage system to carry water away is that runoff increases with urban development. The runoff equivalent of a 10-year storm occurs more frequently, and from smaller storms. The problem is just sent downstream onto someone else's property.

Accordingly, modern subdivision regulations require new developments to ensure that the post-development peak runoff will not be greater than it was under pre-development conditions. This is usually done by constructing retention or detention basins to hold the runoff for a few hours or days, until flows in the system have subsided and the downstream channels can accept the water without flooding.

If the storm sewers or roadside ditches cannot handle a heavy rain, the standard subdivision design uses the streets to carry excess runoff. If the flows exceed the streets' capacity, adjacent properties will flood. Therefore, the third approach to protecting from stormwater flooding is to make sure new buildings are elevated one or two feet above the street or above adjacent grade.

Local Implementation

Reduce Future Flood Losses

Current practices and tracking mechanisms are seeking to reduce flood risks. Future flood control and stormwater improvements in the County will help reduce localized flood risks by improving flood control mechanisms and drainage within the County. In order to reduce future flood losses, the County may consider revisiting their stormwater management ordinances.

Current Standards

Placer County has a stormwater management ordinance. Subdivision design standards require that subdivisions provide for adequate drainage of surface waters and erosion control. All land development must be related to the surrounding drainage pattern, with provisions made for proper drainage facilities. All drainage facilities shall be designed and engineered to carry surface and subsurface waters to the nearest adequate street, storm drain, natural watercourse, or other juncture. All areas shall be graded and drained so that drainage will not cause erosion or endanger the stability of any cut or fill slope or any building or structure. When surface drainage is discharged onto any adjoining property, it shall be discharged in such a manner that it will not cause erosion or endanger any cut or fill slope or any building or structure. Runoff shall not be discharged from the site in quantities or at velocities substantially above those which occurred before grading except into drainage facilities, whose design has been specifically approved by the community development resource agency. In addition, all natural drainage courses into which other

drainage courses empty shall be left undisturbed and shall be provided with adequate dedicated rights of way. Street alignment should follow contour lines or be generally parallel to drainage ways.

Subdivision Regulations

In addition to controlling stormwater runoff as described above, subdivision regulations govern how land will be subdivided and they set construction standards. These standards generally address roads, sidewalks, utilities, storm sewers, and drainage ways. They can include the following flood protection standards:

- Requiring that the final plat show all hazardous areas
- Requiring that each lot be provided with a building site above the flood level
- Requiring that all roadways be no more than one foot below the flood elevation

Local Implementation

Placer County implements local subdivision regulations which require hazard areas to be shown on the final plat. In addition, Placer County's subdivision regulations require, at a minimum, the following to protect the natural and beneficial functions of the floodplain:

- The subdivider shall design the subdivision so that it shall be protected from inundation, flood hazard, sheet overflow and ponding of local storm water, springs and other surface waters.
- The design of improvements shall be such that water occurring within the subdivision will be carried off such subdivision without injury to any improvements, residential sites, or residences to be installed on sites within the subdivision, or to adjoining areas or cause erosion or siltation that would be detrimental to the environment of the area.
- Waters occurring within the subdivision shall be carried to a storm drainage facility or to a natural watercourse by such improvements as may be required to meet the design standards herein set forth, and as outlined within the land development manual.
- Drainage design within the subdivision shall accommodate reasonably anticipated future development within the drainage area.
- Any off-tract outlet drainage facility required to carry storm water from the proposed subdivision to a defined channel or conduit shall be made adequate for the ultimate state of development in the drainage area.
- In any case when a watercourse traverses or serves a subdivision, adequate on-site and/or off-site easements for storm drainage purposes shall be provided.
- A storm drainage maintenance district or acceptable alternate which includes the entire subdivision shall be established for the maintenance of storm drainage facilities within the subdivision and any off-site drainage easements.
- If a storm drainage maintenance district has previously been established within a particular drainage area, where said subdivision is being proposed, the proposed subdivision shall be annexed to the existing district.
- In the event that the county has adopted a drainage plan for said particular drainage area, the subdivider shall be required to pay a fee consisting of a pro rata share of the cost of contracting or estimated cost of constructing drainage facilities within the drainage area.

CRS Credit

CRS credit is provided for both higher regulatory standards in the floodplain and stormwater management standards for new developments. Credit is based on how those standards exceed the minimum NFIP requirements.

Conclusions and Recommendations

- Placer County has Flood Damage Prevention Regulations that exceed minimum national and state standards and will be helpful in preventing flood problems from increasing.
- As DFIRM maps change for Placer, the floodplain regulations for the County may need to be revisited.
- Placer County should continue to implement CRS activities. The County should consider amending its floodplain ordinance for additional higher standards.
- State administration of installation of mobile or manufactured homes does not guarantee that they will be adequately tied down or protected from flooding and other hazards.
- Most zoning ordinances do not designate floodprone areas for any special type of land use.
- Placer County should continue to enforce stormwater management best management practices to control post development site runoff. Consideration of a unified countywide stormwater ordinance will provide consistent regulations between all communities within the Placer County planning area.
- Standards in subdivision regulations for public facilities should account for the hazards present at the site. New building sites, streets, and water systems should facilitate access and use by fire and emergency equipment.

C.4.2. Property Protection Measures

Property protection measures are used to modify buildings or property subject to damage. Property protection measures fall under three approaches:

- Modify the site to keep the hazard from reaching the building,
- Modify the building so it can withstand the impacts of the hazard, and
- Insure the property to provide financial relief after the damage occurs.

Property protection measures are normally implemented by the property owner, although in many cases technical and financial assistance can be provided by a government agency.

Keeping the Hazard Away

Generally, natural hazards do not damage vacant areas. As noted earlier, the major impact of hazards is to people and improved property. In some cases, properties can be modified so the hazard does not reach the damage-prone improvements. For example, a berm can be built to prevent floodwaters from reaching a house.

Flooding

There are five common methods to keep a flood from reaching and damaging a building:

- Erect a barrier between the building and the source of the flooding.
- Move the building out of the floodprone area.

- Elevate the building above the flood level.
- Demolish the building.
- Replace the building with a new one that is elevated above the flood level.

Barriers

A flood protection barrier can be built of dirt or soil (a "berm") or concrete or steel (a "floodwall"). Careful design is needed so as not to create flooding or drainage problems on neighboring properties. Depending on how porous the ground is, if floodwaters will stay up for more than an hour or two, the design needs to account for leaks, seepage of water underneath, and rainwater that will fall inside the perimeter. This is usually done with a sump or drain to collect the internal groundwater and surface water and a pump and pipe to pump the internal drainage over the barrier.

Figure 0-5 Types of Barriers

Barriers can only be built so high. They can be overtopped by a flood higher than expected. Barriers made of earth are susceptible to erosion from rain and floodwaters if not properly sloped, covered with grass, and properly maintained. A berm can also settle over time, lowering its protection level. A floodwall can crack, weaken, and lose its watertight seal. Therefore, barriers need careful design and maintenance (and insurance on the building, in case of failure).

Relocation

Moving a building to higher ground is the surest and safest way to protect it from flooding. While almost any building can be moved, the cost increases for heavier structures, such as those with exterior brick and stone walls, and for large or irregularly shaped buildings.

In areas subject to flash flooding, deep waters, or other high hazard, relocation is often the only safe approach. Relocation is also preferred for large lots that include buildable areas outside the floodplain or where the owner has a new flood-free lot (or portion of the existing lot) available.

Building Elevation

Raising a building above the flood level can be almost as effective as moving it out of the floodplain. Water flows under the building, causing little or no damage to the structure or its contents. Raising a building above the flood level is cheaper than moving it and can be less disruptive to a neighborhood. Elevation has proven to be an acceptable and reasonable means of complying with floodplain regulations that require new, substantially improved, and substantially damaged buildings to be elevated above the base flood elevation.

One concern with elevation is that it may expose the structure to greater impacts from other hazards such as wind and groundshaking. If not braced and anchored properly, an elevated building may have less resistance to the shaking of an earthquake and the pressures of high winds.

Demolition

Some buildings, especially heavily damaged or repetitively flooded ones, are not worth the expense to protect them from future damages. It is cheaper to demolish them and either replace them with new, flood protected structures ("pilot reconstruction"), or relocate the occupants to a safer site. Demolition is also appropriate for buildings that are difficult to move - such as larger, slab foundation or masonry structures - and for dilapidated structures that are not worth protecting. Generally, demolition projects are undertaken by a government agency, so the cost is not borne by the property owner, and the land is converted to public open space use, like a park.

Figure 0-6 Demolition of Flooded Home

One problem that sometimes results from an acquisition and demolition project is a "checkerboard" pattern in which nonadjacent properties are acquired. This can occur when some owners, especially those who have and prefer a waterfront location, are reluctant to leave their homes. Creating such an acquisition pattern in a community simply adds to the maintenance costs that taxpayers must support.

Pilot Reconstruction

If a building is not in good shape, elevating it may not be worthwhile or it may even be dangerous. An alternative is to demolish the structure and build a new one on the site that meets or exceeds all flood and wind protection codes. This was formerly known as "demo/rebuild." FEMA funding programs refer to this approach as "pilot reconstruction." It is still a pilot program, and not a regularly funded option.

Certain rules must be followed to qualify for federal funds for pilot reconstruction:

- Pilot reconstruction is only possible after it has been shown that acquisition or elevation are not feasible, based on the program's criteria.
- Funds are only available to people who owned the property at the time of the event for which funding is authorized.
- It must be demonstrated that the benefits exceed the costs.
- The new building must be elevated to the advisory base flood elevation.
- The new building must not exceed more than 10% of the old building's square footage.
- The new building must meet all flood and wind protection codes.
- There must be a deed restriction that states the owner will buy and keep a flood insurance policy.
- The maximum federal grant is 75% of the cost, up to \$150,000. FEMA is developing a detailed list of eligible costs to ensure that disaster funds are not used to upgrade homes.

Local Implementation

Within the Placer County planning area, acquisition projects have occurred within the City of Roseville, which is not a participant to this plan. However, following the 1995 floods, Placer County, through a hazard mitigation grant, elevated 38 structures along Miners Ravine and Dry Creek.

CRS Credit

The CRS provides the most credit points for acquisition and relocation, because this measure permanently removes insurable buildings from the floodplain. The CRS credits barriers and elevating existing buildings (Activity 530 - Flood Protection). Elevating a building above the flood level will also reduce the flood insurance premiums on that individual building. Because barriers are less secure than elevation, not as many points are provided. Higher scores are possible, but they are based on the number of buildings removed compared to the number remaining in the floodplain.

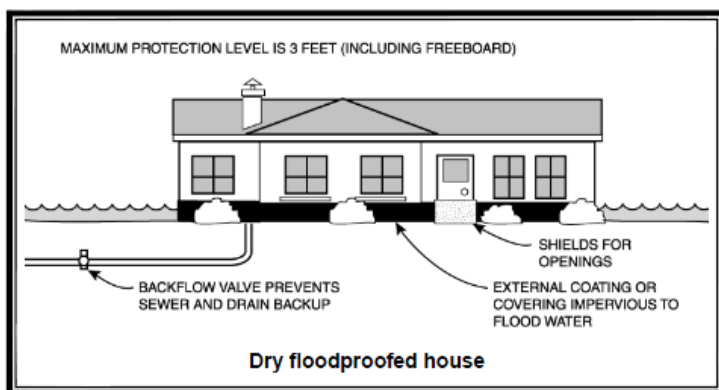

Retrofitting

An alternative to keeping the hazard away from a building is to modify or retrofit the site or building to minimize or prevent damage. There are a variety of techniques to do this, as described below.

Dry Floodproofing

Dry floodproofing means making all areas below the flood protection level watertight. Walls are coated with waterproofing compounds or plastic sheeting. Openings, such as doors, windows and vents, are closed, either permanently, with removable shields, or with sandbags. Dry floodproofing of new and existing nonresidential buildings in the regulatory floodplain is permitted under state, FEMA and local regulations. Dry floodproofing of existing residential buildings in the floodplain is also permitted as long as the building is not substantially damaged or being substantially improved. Owners of buildings located outside the regulatory floodplain can always use dry floodproofing techniques.

Figure 0-7 Dry Floodproofing

Dry floodproofing is only effective for shallow flooding, such as repetitive drainage problems. It does not protect from the deep flooding along lakes and larger rivers caused by hurricanes or other storms.

Wet Floodproofing

The alternative to dry floodproofing is wet floodproofing: water is let in and everything that could be damaged by a flood is removed or elevated above the flood level. Structural components below the flood level are replaced with materials that are not subject to water damage. For example, concrete block walls are used instead of wooden studs and gypsum wallboard. The furnace, water heater and laundry facilities are permanently relocated to a higher floor. Where the flooding is not deep, these appliances can be raised on blocks or platforms.

Local Implementation

Dry flood proofing would likely be most appropriate for most of Placer County due to the current base flood elevations and the nature of flooding in the County (relatively low level flooding).

CRS Credit

Credit for dry and wet floodproofing and sewer backup protection is provided under Activity 530 - Retrofitting. Because these property protection measures are less secure than barriers and elevation, not as many points are provided.

Insurance

Technically, insurance does not mitigate damage caused by a natural hazard. However, it does help the owner repair, rebuild, and hopefully afford to incorporate some of the other property protection measures in the process. Insurance offers the advantage of protecting the property, as long as the policy is in force, without requiring human intervention for the measure to work.

Private Property

Although most homeowner's insurance policies do not cover a property for flood damage, an owner can insure a building for damage by surface flooding through the NFIP. Flood insurance coverage is provided for buildings and their contents damaged by a "general condition of surface flooding" in the area.

Figure 0-8 Flood Insurance Coverage

Building Exposure	Premium
In the Special Flood Hazard Area (AE Zone)	
Pre-FIRM ("subsidized") rate	\$1,689
Post-FIRM (actuarial) rates	
2 feet above the base flood elevation	\$440
1 foot above the base flood elevation	\$643
At the base flood elevation	\$1,167
1 foot below the base flood elevation	\$4,379
Outside the Special Flood Hazard Area	
	\$1,029

Premiums are for \$150,000 in building coverage and \$75,000 in contents coverage for a one story house with no basement and a \$500 deductible, using the October 2008 Flood Insurance Manual. Premiums include the 5% Community Rating System discount in unincorporated St. Tammany Parish. Premiums are higher in the municipalities, which are not in the CRS.

Most people purchase flood insurance because it is required by the bank when they get a mortgage or home improvement loan. Usually these policies just cover the building's structure and not the contents. Contents coverage can be purchased separately. Renters can buy contents coverage, even if the owner does not buy structural coverage on the building. Most people don't realize that there is a 30-day waiting period to purchase a flood insurance policy and there are limits on coverage.

Public Property

Governments can purchase commercial insurance policies. Larger local governments often self-insure and absorb the cost of damage to one facility, but if many properties are exposed to damage, self-insurance can drain the government's budget. Communities cannot expect federal disaster assistance to make up the difference after a flood.

Under Section 406(d) of the Stafford Act:

"If an eligible insurable facility damaged by flooding is located in a [mapped floodplain] ... and the facility is not covered (or is underinsured) by flood insurance on the date of such flooding, FEMA is required to reduce Federal disaster assistance by the maximum amount of insurance proceeds that would have been received had the buildings and contents been fully covered under a National Flood Insurance Program (NFIP) standard flood insurance policy. [Generally, the maximum amount of proceeds for a non-residential property is \$500,000.]"

[Communities] need to:

- Identify all insurable facilities, and the type and amount of coverage (including deductibles and policy limits) for each. The anticipated insurance proceeds will be deducted from the total eligible damages to the facilities.

- Identify all facilities that have previously received Federal disaster assistance for which insurance was required. Determine if insurance has been maintained. A failure to maintain the required insurance for the hazard that caused the disaster will render ineligible for Public Assistance funding...
- [Communities] must obtain and maintain insurance to cover [their] facility - buildings, equipment, contents and vehicles - for the hazard that caused the damage in order to receive Public Assistance funding. Such coverage must, at a minimum, be in the amount of the eligible project costs. FEMA will not provide assistance for that facility in future disasters if the requirement to purchase insurance is not met. - FEMA Response and Recovery Directorate Policy No. 9580.3, August 23, 2000

In other words, the law expects public agencies to be fully insured as a condition of receiving federal disaster assistance.

Local Implementation

NFIP insurance data indicates that as of August 21, 2020, there were 817 policies in force in the unincorporated County, resulting in \$233,180,600 of insurance in force. Of these, 802 are for residential properties; 15 are nonresidential. 249 of these are in A zones; 568 policies are for parcels in the B, C, & X zones. There have been 236 closed paid losses totaling \$4,788,314.79; 229 of these were for residential properties and 7 were nonresidential. Of these 236 paid losses, 102 were parcels in A zones and 120 parcels were in B, C, & X zones. Information was not provided on the other 4 claims. There are 44 repetitive loss (RL) structures, and 0 severe repetitive loss (SRL) structures in the County – with 60 paid losses totaling \$1,590,452.20. Of these RL buildings, 22 are in the A zones and 22 are in the B, C, or X zone. Only one of these RL buildings is a post-FIRM building. According to the County, only 9 RL properties are not mitigated. There have been 25 substantial damage claims since 1978.

CRS Credit

There is no credit for purchasing flood insurance, but the CRS does provide credit for local public information programs that explain flood insurance to property owners. The CRS also reduces the premiums for those people who do buy NFIP coverage.

The Government's Role

Property protection measures are usually considered the responsibility of the property owner. However, local governments should be involved in all strategies that can reduce flood losses, especially acquisition and conversion of a site to public open space. There are various roles a municipality can play in encouraging and supporting implementation of these measures.

One of the first duties of a local government is to protect its own facilities. Fire stations, water treatment plants and other critical facilities should be a high priority for retrofitting projects and insurance coverage. Often public agencies discover after the disaster that their "all-hazard" insurance policies do not cover the property for the type of damage incurred. Flood insurance is even more important as a mitigation measure because of certain Stafford Act provisions.

Providing basic information to property owners is the first step in supporting property protection measures. Owners need general information on what can be done. They need to see examples, preferably from nearby.

Communities can help owners by helping to pay for a retrofitting project. Financial assistance can range from full funding of a project to helping residents find money from other programs. Some communities assume responsibility for sewer backups, street flooding, and other problems that arise from an inadequate public sewer or public drainage system. Less expensive community programs include low interest loans, forgivable low interest loans and rebates. A forgivable loan is one that does not need to be repaid if the owner does not sell the house for a specified period, such as five years. These approaches don't fully fund the project, but they cost the community less and they increase the owner's commitment to the flood protection project. Often, small amounts of money act as a catalyst to pique the owner's interest to get a self-protection project moving.

The more common outside funding sources are listed below. Unfortunately, the last three are only available after a disaster, not before, when damage could be prevented.

Pre-disaster funding sources:

- FEMA's Pre-Disaster Mitigation (PDM) grants
- FEMA's Flood Mitigation Assistance (FMA) grants
- Community Development Block Grants
- Conservation organizations, although generally these organizations prefer to purchase vacant land in natural areas, not properties with buildings on them.

Post-disaster funding sources:

- Insurance claims
- The NFIP's Increased Cost of Compliance. This provision increases a flood insurance claim payment to help pay for a flood protection project required by code as a condition to rebuild the flooded building. It can also be used to help pay the non-federal cost-share of an elevation project.

Post-disaster funding sources, federal disaster declaration needed:

- FEMA's disaster assistance (for public properties). However, after a flood, the amount of assistance will be reduced by the amount of flood insurance that the public agency should be carrying on the property.
- Small Business Administration disaster loans (for non-governmental properties)
- FEMA's Hazard Mitigation Grant Program

Acquisition Agent

The community can be the focal point in an acquisition project. Most funding programs require a local public agency to sponsor the project. The local government could process the funding application, work with the owners, and provide some, or all, of the local share. In some cases, the local government would be the ultimate owner of the property, but in other cases another public agency could assume ownership and the attendant maintenance responsibilities.

Mandates

Mandates are considered a last resort if information and incentives are insufficient to convince a property owner to take protective actions. An example of a retrofitting mandate is the requirement that communities have to disconnect downspouts from the sanitary sewer line.

There is a mandate for improvements or repairs made to a building in the mapped floodplain. If the project equals or exceeds 50% of the value of the original building, it is considered a "substantial improvement." The building must then be elevated or otherwise brought up to current flood protection codes.

Another possible mandate is to require less expensive hazard protection steps as a condition of a building permit. For example, many communities require upgraded electrical service as a condition of a home improvement project. If a person were to apply for a permit for electrical work, the community could require that the service box be moved above the base flood elevation or the installation of a separate ground fault interrupter circuits in the basement.

Local Implementation

Within Placer County several homes have been retrofitted for flood protection and others have been elevated, while no homes have been acquired and relocated. The largest retrofit project within the unincorporated county was after the 1995 flood event, along with the 38 elevations, located along Miners Ravine and Dry Creek.

CRS Credit

Except for public information programs, the CRS does not provide credit for efforts to fund, provide incentives, or mandate property protection measures. CRS credits are provided for the actual projects after they are completed. However, to participate in CRS, a community must certify that it has adequate flood insurance on all properties that have been required to be insured. The minimum requirement is to insure those properties in the mapped floodplain that have received federal aid, as specified by the Flood Disaster Protection Act of 1973.

Repetitive Loss Properties and Analysis

Repetitive loss properties deserve special attention because they are more prone to damage by natural hazards than any other properties in the County planning area. Further, protecting repetitive loss buildings is a priority with FEMA mitigation funding programs.

Unincorporated Placer County's vulnerability to flooding is highlighted by its number of Repetitive Losses. According to the August 21, 2020 data from the state on NFIP communities, There are 44 repetitive loss (RL) structures, and 0 severe repetitive loss (SRL) structures in the County – with 60 paid losses totaling \$\$1,590,452.20. Of these RL buildings, 22 are in the A zones and 22 are in the B, C, or X zone. Only one of these RL buildings is a post-FIRM building. According to the County, only 9 RL properties are not mitigated. There have been 25 substantial damage claims since 1978.

Conclusions and Recommendations

- There are several ways to protect individual properties from damage by natural hazards. The advantages and disadvantages of each should be examined for each situation.
- Property protection measures can protect the most damage-prone buildings in the County planning area including repetitive loss properties.
- 29% of the buildings in the floodplains in unincorporated Placer County are covered by flood insurance, up from less than 19% from the 2016 LHMP.
- Property owners can implement some property protection measures at little cost, especially for sites in areas of low hazards (e.g., shallow flooding, sewer backup, and thunderstorms). For other measures, such as relocation and elevation, the owners may need financial assistance.
- Local government agencies can promote and support property protection measures through several activities, ranging from public information to financial incentives to full funding.
- It is unlikely that most government properties, including critical facilities, have any special measures to protect them from flooding.
- Because properties in floodplains will be damaged at some point, efforts should continue to provide information and advice to floodplain property owners. Special attention should be given to repetitive loss and high hazard areas.
- Public education materials can be developed/enhanced to explain property protection measures that can help owners reduce their exposure to damage by floods and the various types of insurance that are available.
- All property protection projects should be voluntary. Other than state and federally mandated regulations, local incentives should be positive as much as possible, such as providing financial assistance.
- A FEMA Hazard Mitigation Assistance (HMA) Grant workshop focused on private firms and citizens could be conducted annually to showcase the assistance that FEMA (HMGP, BRIC, FMA, RFC and SRL) provides and to encourage public participation.
- A standard checklist could be developed to evaluate a property's exposure to damage from floods. It should include a review of insurance coverage and identify where more information can be found on appropriate property protection measures. The checklist should be provided to each agency participating in this planning process and made available to the public.
- Placer County should evaluate its own properties using the standard checklist. A priority should be placed on determining critical facilities' vulnerability to damage and whether public properties are adequately insured.
- Placer County should protect their own publicly owned facilities with appropriate mitigation measures.

C.4.3. Natural Resource Protection

Resource protection activities are generally aimed at preserving (or in some cases restoring) natural areas. These activities enable the naturally beneficial functions of fields, floodplains, wetlands, and other natural lands to operate more effectively. Natural and beneficial functions of watersheds, floodplains and wetlands include:

- Reduction in runoff from rainwater and snow melt in pervious areas
- Infiltration that absorbs overland flood flow
- Removal and filtering of excess nutrients, pollutants and sediments
- Storage of floodwaters
- Absorption of flood energy and reduction in flood scour
- Water quality improvement
- Groundwater recharge

- Habitat for flora and fauna
- Recreational and aesthetic opportunities

As development occurs, many of the above benefits can be achieved through regulatory steps for protecting natural areas or natural functions. The regulatory programs are discussed in Section 5.3 Preventive Measures of the base plan. This section covers the resource protection programs and standards that can help mitigate the impact of natural hazards, while they improve the overall environment. Seven areas are reviewed:

- Wetland protection
- Erosion and sedimentation control
- River restoration
- Best management practices
- Dumping regulations
- Urban forestry
- Farmland protection

Wetland Protection

Wetlands are often found in floodplains and depressional areas of a watershed. Many wetlands receive and store floodwaters, thus slowing and reducing downstream flows. They also serve as a natural filter, which helps to improve water quality, and they provide habitat for many species of fish, wildlife and plants.

Wetlands that are determined to be part of the waters of the United States are regulated by the U.S. Army Corps of Engineers and the U.S. Environmental Protection Agency (US EPA) under Section 404 of the Clean Water Act. Before a "404" permit is issued, the plans are reviewed by several agencies, including the Corps and the U.S. Fish and Wildlife Service. Each of these agencies must sign off on individual permits.

There are also nationwide permits that allow small projects that meet certain criteria to proceed without individual permits. Wetlands not included in the Corps' jurisdiction or that are addressed by a nationwide permit may be regulated against by local authorities.

If a permit is issued by the Corps, County, or one of the cities, the impact of the development is typically required to be mitigated. Wetland mitigation can include creation, restoration, enhancement or preservation of wetlands elsewhere. Wetland mitigation is often accomplished within the development site, however, mitigation is allowed off-site and sometimes in another watershed. The appropriate type of mitigation is addressed in each permit.

Some developers and government agencies have accomplished the required mitigation by buying into a wetland bank. Wetland banks are large wetlands created for the purpose of mitigation. The banks accept money to reimburse the owner for setting the land aside from development.

When a wetland is mitigated at a separate site there are drawbacks to consider. First, it takes many years for a new wetland to approach the same quality as an existing one. Second, a new wetland in a different location (especially if it is in a different watershed) will not have the same flood damage reduction benefits as the original one did.

Local Implementation

Placer County has ordinances that reduce the ability to develop near a wetland. The building and development section of the municipal code restricts grading and soil disturbances in wetlands, drainage ways, stream environment zones, or water bodies.

CRS Credit

The CRS focuses on activities that directly affect flood damage to insurable buildings. While there is no credit for relying on the Corps of Engineers' 404 regulations, there is credit for preserving open space in its natural condition or restored to a state approximating its natural condition. The credit is based on the percentage of the floodplain that can be documented as wetlands protected from development by ownership or local regulations.

The CRS focuses on activities that directly affect flood damage to insurable buildings. While there is no credit for relying on the Corps of Engineers' 404 regulations, there is credit for maintaining water quality buffers that protect streams, rivers, lakes and shorelines in their natural condition or restoring them to an approximate natural state. Credit is also available for an approved habitat conservation plan.

Erosion and Sedimentation Control

Farmlands and construction sites typically contain large areas of bare exposed soil. Surface water runoff can erode soil from these sites, sending sediment into downstream waterways. Erosion also occurs along stream banks and shorelines as the volume and velocity of flow or wave action destabilize and wash away the soil.

Sediment suspended in the water tends to settle out where flowing water slows down. This can clog storm drains, drain tiles, culverts and ditches and reduce the water transport and storage capacity of river and stream channels, lakes and wetlands. When channels are constricted and flooding cannot deposit sediment in the bottomlands, even more sediment is left in the channels. The result is either clogged streams or increased dredging costs.

Not only are the drainage channels less able to perform their job, but the sediment in the water reduces light, oxygen and water quality, and often carries chemicals, heavy metals and other pollutants. Sediment has been identified by the US EPA as the nation's number one nonpoint source pollutant for aquatic life.

There are two principal strategies to address these problems: minimize erosion and control sedimentation. Techniques to minimize erosion include phased construction, minimal land clearing, and stabilizing bare ground as soon as possible with vegetation and other soil stabilizing practices.

Figure 0-9 Erosion Control

If erosion occurs, other measures are used to capture sediment before it leaves the site. Silt fences, sediment traps and vegetated filter strips are commonly used to control sediment transport. Runoff from the site can be slowed down by terraces, contour strip farming, no-till farm practices, hay or straw bales, constructed wetlands, and impoundments (e.g., sediment basins and farm ponds). Slowing surface water runoff on the way to a drainage channel increases infiltration into the soil and reduces the volume of topsoil eroded from the site.

Erosion and sedimentation control regulations mandate that these types of practices be incorporated into construction plans. The most common approach is to require applicants for permits to submit an erosion and sediment control plan for the construction project. This allows the applicant to determine the best practices for the site.

Local Implementation

The County has ordinances that include standards for erosion and sedimentation control. The Placer County Flood Control District has an annual stream clearing program. Placer County completed water quality monitoring in the Truckee River Basin and monitors sediment loading the Lake Tahoe Basin.

CRS Credit

Local governments whose ordinances include erosion and sedimentation control provisions can qualify for up to 45 points for this measure.

River Restoration

There is a growing movement that has several names, such as "stream conservation," "bioengineering," or "riparian corridor restoration." The objective of these approaches is to return streams, stream banks and

adjacent land to a more natural condition, including the natural meanders. Another term is "ecological restoration," which restores native indigenous plants and animals to an area.

A key component of these efforts is to use appropriate native plantings along the banks that resist erosion. This may involve retrofitting the shoreline with willow cuttings, wetland plants, or rolls of landscape material covered with a natural fabric that decomposes after the banks are stabilized with plant roots.

In all, restoring the right vegetation to a stream has the following advantages:

- Reduces the amount of sediment and pollutants entering the water
- Enhances aquatic habitat by cooling water temperature
- Provides food and shelter for both aquatic and terrestrial wildlife
- Can reduce flood damage by slowing the velocity of water
- Increases the beauty of the land and its property value
- Prevents property loss due to erosion
- Provides recreational opportunities, such as hunting, fishing and bird watching
- Reduces long-term maintenance costs

Figure 0-10 River Restoration Zones

Local Implementation

Placer County has implemented these activities for water quality and floodplain management purposes. See <https://www.placer.ca.gov/DocumentCenter/View/50871/PCCP-Requirements-Stream-System-Grading-Permits?bidId=>

CRS Credit

The CRS focuses on activities that directly affect flood damage to insurable buildings. However, there are credits for preserving open space in its natural condition or restored to a state approximating its natural condition. There are also credits for channel setbacks, buffers and protecting shorelines. Placer County currently receives some credit for open space conservation.

Best Management Practices

Point source pollutants come from pipes such as the outfall of a municipal wastewater treatment plant. They are regulated by the US EPA and the California Department of Water Resources. Nonpoint source pollutants come from non-specific locations and harder to regulate. Examples of nonpoint source pollutants are lawn fertilizers, pesticides, other chemicals, animal wastes, oils from street surfaces and industrial areas, and sediment from agriculture, construction, mining and forestry. These pollutants are washed off the ground's surface by stormwater and flushed into receiving storm sewers, ditches and streams.

The term "best management practices" (BMPs) refers to design, construction and maintenance practices and criteria that minimize the impact of stormwater runoff rates and volumes, prevent erosion, protect natural resources and capture nonpoint source pollutants (including sediment). They can prevent increases in downstream flooding by attenuating runoff and enhancing infiltration of stormwater. They also minimize water quality degradation, preserve beneficial natural features onsite, maintain natural base flows, minimize habitat loss, and provide multiple usages of drainage and storage facilities.

Local Implementation

Placer County participates in the National Pollutant Discharge Elimination System permitting program and require BMPs to minimize stormwater impacts.

CRS Credit

A community can receive CRS points if regulations require new developments to include in the design of their permanent stormwater management facilities appropriate BMPs that will improve the quality of surface waters.

Figure 0-11 Stormwater Best Management Practices

Dumping Regulations

BMPs usually address pollutants that are liquids or are suspended in water that are washed into a lake or stream. Dumping regulations address solid matter, such as shopping carts, appliances and landscape waste that can be accidentally or intentionally thrown into channels or wetlands. Such materials may not pollute the water, but they can obstruct even low flows and reduce the channels' and wetlands' abilities to convey or clean stormwater.

Many communities have nuisance ordinances that prohibit dumping garbage or other "objectionable waste" on public or private property. Waterway dumping regulations need to also apply to "non-objectionable" materials, such as grass clippings or tree branches, which can kill ground cover or cause obstructions in channels. Regular inspections to catch violations should be scheduled.

Many people do not realize the consequences of their actions. They may, for example, fill in the ditch in their front yard without realizing that is needed to drain street runoff. They may not understand how regarding their yard, filling a wetland, or discarding leaves or branches in a watercourse can cause a problem to themselves and others. Therefore, a dumping enforcement program should include public information materials that explain the reasons for the rules as well as the penalties.

Local Implementation

Placer County ordinances makes it unlawful for anyone to deposit waste, grass, weeds, brush or other refuse in any street, ditch or watercourse, or on others' property, or on public property. It is also illegal to dispose of certain wastes in public sewers.

CRS Credit

The CRS provides credit for enforcing and publicizing a regulation that prohibits dumping in the drainage system.

Farmland Protection

Farmland protection is quickly becoming an important piece of comprehensive planning and zoning throughout the United States. The purpose of farmland protection is to provide mechanisms for prime, unique, or important agricultural land to remain as such, and to be protected from conversion to nonagricultural uses.

Frequently, farm owners sell their land to residential or commercial developers and the property is converted to non-agricultural land uses. With development comes more buildings, roads and other infrastructure. Urban sprawl occurs, which can lead to additional stormwater runoff and emergency management difficulties.

Figure 0-12 Floodplain Damages to Farmland

Farms on the edge of cities are often appraised based on the price they could be sold for to urban developers. This may drive farmers to sell to developers because their marginal farm operations cannot afford to be taxed as urban land. The Farmland Protection Program in the United States Department of Agriculture's 2002 Farm Bill (Part 519) allows for funds to go to state, tribal, and local governments as well as nonprofit organizations to help purchase easements on agricultural land to protect against the development of the land. Eligible land includes cropland, rangeland, grassland, pastureland, or forest land that is part of an agricultural operation. Certain lands within historical or archaeological resources are also included.

The hazard mitigation benefits of farmland protection are similar to those of open space preservation:

- Farmland is preserved for future generations,
- Farmland in the floodplain keeps damageable structures out of harm's way,
- Farmland keeps more stormwater on site and lets less stormwater runoff downstream,
- Rural economic stability and development is sustained,
- Ecosystems are maintain, restored or enhanced, and
- The rural character and scenic beauty of the area is maintained.

Local Implementation

Placer County currently requires farmland protection provisions under the Williamson Act.

CRS Credit

Credit is given for preserving open space in the floodplain, regardless of why it is being preserved. Credit is also provided for density zoning of floodprone areas.

Conclusions and Recommendations

- A hazard mitigation program can use resource protection programs to support protecting areas and natural features that can mitigate the impacts of natural hazards.
- Placer County ordinances prohibit illicit discharges into public sewers or onto public or private property.
- Preserving farmland in the floodplain will maintain open space and prevent damage to homes, businesses, and other development.
- The public and decision makers should be informed about the hazard mitigation benefits of restoring rivers, wetlands and other natural areas. Restoration and protection techniques should be explained.
- Placer County may consider publicizing its illicit discharge rules more widely.
- The public should be informed about the need to protect streams and wetlands from dumping and inappropriate development and the relevant codes and regulations.

C.4.4. Emergency Services Measures

Emergency services measures protect people during and after a disaster. A good emergency management program addresses all hazards, and it involves all local government departments. At the state level, emergency services programs are coordinated by the California Office of Emergency Services (Cal OES). Locally, emergency services are coordinated by the Placer County Office of Emergency Services.

This section reviews emergency services measures following a chronological order of responding to an emergency. It starts with identifying an impending problem (threat recognition) and continues through post-disaster activities.

Threat Recognition

The first step in responding to a flood, storm, or other natural hazard is to know when weather conditions are such that an event could occur. With a proper and timely threat recognition system, adequate warnings can be disseminated.

The National Weather Service (NWS) is the prime agency for detecting meteorological threats, such as tornadoes, thunderstorms and winter storms. Severe weather warnings are transmitted through NOAA's Weather Radio System. Federal agencies can only look at the large scale, e.g., whether conditions are appropriate for the formation of a thunderstorm. Local emergency managers can provide more site-specific and timely recognition by sending out NWS trained spotters to watch the skies when the Weather Service issues a watch or a warning.

Severe snow storms can often be forecast days in advance of the expected event, which allows time for warning and preparation. Though more difficult, the NWS can also forecast ice storms.

A flood threat recognition system predicts the time and height of a flood crest. This can be done by measuring rainfall, soil moisture, and stream flows upstream of the community and calculating the subsequent flood levels.

On larger rivers, this measuring and calculating is performed by the NWS, a part of the U.S. Department of Commerce's National Oceanic and Atmospheric Administration (NOAA). Support for NOAA's efforts is provided by cooperating partners from state and local agencies. Forecasts of expected river stages are made through the Advanced Hydrologic Prediction Service (AHPS) of the National Weather Service. Flood threat predictions are disseminated on the NOAA Weather Wire or NOAA Weather Radio. NOAA Weather Radio is considered by the federal government as the official source for weather information.

On smaller rivers, locally established rainfall and river gauges are needed to establish a flood threat recognition system. The NWS may issue a "flash flood watch." This is issued to indicate current or developing hydrologic conditions that are favorable for flash flooding in and close to the watch area, but the occurrence is neither certain nor imminent. These events are so localized and so rapid that a "flash flood warning" may not be issued, especially if no remote threat recognition equipment is available. In the absence of a gauging system on small streams, the best threat recognition system is to have local personnel monitor rainfall and stream conditions. While specific flood crests and times will not be predicted, this approach will provide advance notice of potential local or flash flooding.

Local Implementation

The County has an Emergency Operations Plan which is currently being updated in 2021 that includes procedures for threat identification. The County is not currently a StormReady certified County. StormReady communities are better prepared to save lives from the onslaught of severe weather through advanced planning, education, and awareness. Placer County OES does, however, work closely with the National Weather Service for issuing an Emergency Alert System (EAS). Additional County's threat identification mechanisms include:

ALERT System. The County's network of ALERT Flood Warning gauges, including numerous precipitation gages and stream level gages located throughout western Placer County provide real time monitoring information on current flood conditions which assist in informing the activation of additional warning and evacuation of affected areas.

Dam Protocols. Should an event trigger the activation of an Emergency Action Plan (EAP) for a potential dam failure, County OES receives this information via direct phone calls from the originating source/agency

or from PCSO Dispatch and/or Cal OES. County OES then follows the notification and evacuation procedures called for in the EAP.

CRS Credit

Credit can be received for using river flood stage predictions for the NWS's gages. The actual score is based on how much of the community's floodplain is affected by these systems. Potential CRS credit is possible under Activity 610 - Flood Warning Program and Response.

Warning

After the threat recognition system tells the emergency services office that a flood, tornado, thunderstorm, or other hazard is coming, the next step is to notify the public and staff of other agencies and critical facilities. More people can implement protection measures if warnings are early and include specific detail.

The NWS issues notices to the public using two levels of notification:

- Watch: conditions are right for flooding, thunderstorms, tornadoes or winter storms.
- Warning: a flood, tornado, etc., has started or been observed.

A more specific warning may be disseminated by the community in a variety of ways. The following are the more common methods:

- Placer Alert/Everbridge
- Commercial or public radio or TV stations
- The Weather Channel
- Cable TV emergency news inserts
- Telephone trees/mass telephone notification
- NOAA Weather Radio
- Tone activated receivers in key facilities
- Outdoor warning sirens
- Sirens on public safety vehicles
- Door-to-door contact
- Mobile public address systems
- Email notifications

Multiple or redundant systems are most effective - if people do not hear one warning, they may still get the message from another part of the system. Each has advantages and disadvantages:

- Radio and television provide a lot of information, but people have to know when to turn them on. They are most appropriate for hazards that develop over more than a day, such as a tropical storm, hurricane, or winter storm.
- NOAA Weather Radio can provide short messages of any impending weather hazard or emergency and advise people to turn on their televisions for more information, but not everyone has a Weather Radio.
- Outdoor warning sirens can reach many people quickly as long as they are outdoors. They do not reach people in tightly-insulated buildings or those around loud noise, such as at a factory, during a thunderstorm, or in air conditioned homes. They do not explain what hazard is coming, but people should know to turn on a radio or television when they hear the siren.

- Automated telephone notification services are also fast, but can be expensive and do not work when phone lines are down. Nor do they work for unlisted numbers, call screening services, or cellular service, unless people sign up for notifications.
- Where a threat has a longer lead time, going door-to-door and manual telephone trees can be effective.

Just as important as issuing a warning is telling people what to do in case of an emergency. A warning program should have a public information aspect. Citizens should know the difference between a tornado warning (when they should seek shelter in a low spot), a flood warning (when they should stay out of low areas), and other appropriate warnings and responses.

StormReady

The National Weather Service established the StormReady program to help local governments improve the timeliness and effectiveness of hazardous weather related warnings for the public. To be officially StormReady, a community must:

- Establish a 24-hour warning point and emergency operations center,
- Have more than one way to receive severe weather warnings and forecasts and to alert the public,
- Create a system that monitors weather conditions locally,
- Promote the importance of public readiness through community seminars, and
- Develop a formal hazardous weather plan, which includes training severe weather spotters and holding emergency exercises.

Being designated a StormReady community by the National Weather Service is a good measure of a community's emergency warning program for weather hazards. It is also credited by the CRS.

Local Implementation

The Placer County Office of Emergency Services serves as the emergency manager during an emergency. Local police and fire departments are also responsible for enforcing actions required during an emergency. In the event of a severe flood, wildfire or other natural hazard event, the Placer County OES webpage will identify current emergencies at: <https://www.placer.ca.gov/1379/Current-Emergency-Information>. The County will also provide emergency information and broadcast warnings on local radio and television stations as well as on social media websites such as Facebook and Twitter. The new Everbridge system, described further below, may be activated and helicopters may be used to broadcast warnings/alerts via a PA system. If time and condition/safety permits, vehicle patrol units may also broadcast warnings in affected areas.

Everbridge. In 2015, Placer County and all participating cities to this plan established the Everbridge/Placer Alert System employed for issuing flood warnings, alerts and evacuation notices to the public. The Placer County Flood Control and Water Conservation District coordinated with County OES, Sheriff, County Planning, and Department of Public Works for this system. Flood warning zones across the County were created and Sheriff's dispatch is the lead agency in employing Everbridge and issuing specific flood event warnings as necessary. The District will continue to assist during an event by providing technical input to OES as to the need for a warning issuance as well as any resulting evacuations.

CRS Credit

Community Rating System points are based on the number and types of warning media that can reach the community's flood prone population. Depending on the location, communities can receive credit for the telephone calling system and more points if there are additional measures, like telephone trees. Being designated as a StormReady community can provide additional points. These credits are in Activity 610 - Flood Warning Program and Response.

Response

The protection of life and property is the most important task of emergency responders. Concurrent with threat recognition and issuing warnings, a community should respond with actions that can prevent or reduce damage and injuries. Typical actions and responding parties include the following:

- Activating the emergency operations center (emergency preparedness),
- Closing streets or bridges (police or public works),
- Shutting off power to threatened areas (utility company),
- Passing out sand and sandbags (public works),
- Holding children at school or releasing children from school (school superintendent),
- Opening evacuation shelters (the American Red Cross),
- Monitoring water levels (public works), and
- Establishing security and other protection measures (police).

An emergency action plan ensures that all bases are covered and that the response activities are appropriate for the expected threat. These plans are developed in coordination with the agencies or offices that are given various responsibilities.

A flood stage forecast map shows areas that will be under water at various flood stages. Different flood levels are shown as color coded areas, so the emergency manager can quickly see what will be affected. Emergency management staff can identify the number of properties flooded, which roads will be under water, which critical facilities will be affected, and who to warn. With this information, an advance plan can be prepared that shows problem sites and determines what resources will be needed to respond to the predicted flood level.

Emergency response plans should be updated annually to keep contact names and telephone numbers current and to ensure that supplies and equipment that will be needed are still available. They should be critiqued and revised after disasters and exercises to take advantage of the lessons learned and of changing conditions. The end result is a coordinated effort implemented by people who have experience working together so that available resources will be used in the most efficient manner possible.

Local Implementation

Placer County Office of Emergency Services serves as the Emergency Manager for the County. Response is provided cooperation with the County Sheriff, city police, and fire departments. The Placer County Emergency Operations Plan (currently being updated in 2021) includes addresses the planned response to emergency situations associated with natural disasters and emergencies in or affecting Placer County. The EOP is intended to facilitate multi-agency and multi-jurisdictional coordination in emergency operations.

It seeks to mitigate the effects of hazards, prepare for measures to be taken which will preserve life and minimize damage, enhance response during emergencies and provide necessary assistance, and establish a recovery system to return the County the local jurisdictions to their normal state of affairs.

CRS Credit

The CRS program provides credit under Activity 610- Flood Warning for a warning system that effectively notifies residents of a flood and has procedures for testing and monitoring the system.

Evacuation and Shelter

According to Emergency Management: Principles and Practice, "The principle of evacuation is to move citizens from a place of relative danger to a place of relative safety, via a route that does not pose significant danger." There are six key ingredients to a successful evacuation:

- Adequate warning
- Adequate routes
- Proper timing to ensure the routes are clear
- Traffic control
- Knowledgeable travelers
- Care for special populations (e.g., the handicapped, prisoners, hospital patients, and schoolchildren)

Those who cannot get out of harm's way need shelter. Typically, the American Red Cross will staff a shelter and ensure that there is adequate food, bedding, and wash facilities. Shelter management is a specialized skill. Managers must deal with problems like scared children, families that want to bring in their pets, and the potential for an overcrowded facility.

Local Implementation

The Placer County EOP includes multiple annexes, one of which is the Mass Evacuation Annex. This Annex addresses evacuation policies and procedures due to natural hazards and other events. Emergency evacuation planning involves multiple governmental agencies and private organizations performing such functions as threat identification, warning, evacuation decision making, communications, traffic control, and shelter and medical needs management. A component of this is Pre-Disaster Public Awareness and Education which is major component in successfully reducing loss of life and property in a community when faced with a potentially catastrophic incident.

In addition to the Mass Evacuation Annex to the EOP, the County has several evacuation plans covering various areas of the County.

CRS Credit

Because it is primarily concerned with protecting insurable buildings, the CRS does not provide any special credit for evacuation or sheltering of people (minimal credit is given in Activity 510 - Floodplain Management for evacuation policies and procedures). It is assumed that the emergency response plan would include all necessary actions in response to a flood.

Post-Disaster Recovery and Mitigation

After a disaster, communities should undertake activities to protect public health and safety and facilitate recovery. Appropriate measures include:

- Patrolling evacuated areas to prevent looting,
- Providing safe drinking water,
- Monitoring for diseases,
- Vaccinating residents for tetanus and other diseases,
- Clearing streets, and
- Cleaning up debris and garbage.

Throughout the recovery phase, everyone wants to get "back to normal." The problem is that "normal" means the way they were before the disaster, exposed to repeated damage from future disasters. There should be an effort to help prepare people and property for the next disaster. Such an effort would include:

- Public information activities to advise residents about mitigation measures they can incorporate into their reconstruction work,
- Evaluating damaged public facilities to identify mitigation measures that can be included during repairs,
- Identifying other mitigation measures that can lessen the impact of the next disaster,
- Acquiring substantially or repeatedly damaged properties from willing sellers,
- Planning for long-term mitigation activities, and
- Applying for post-disaster mitigation funds.

Regulating Reconstruction

Requiring permits for building repairs and conducting inspections are vital activities to ensure that damaged structures are safe for people to reenter and repair. There is a special requirement to do this in floodplains, regardless of the type of disaster or the cause of damage. The NFIP requires that local officials enforce the substantial damage regulations. These rules require that if the cost to repair a building in the mapped floodplain equals or exceeds 50% of the building's market value, the building must be retrofitted to meet the standards of a new building in the floodplain. In most cases, this means that a substantially damaged building must be elevated above the base flood elevation.

This requirement can be very difficult for understaffed and overworked offices following a disaster. However, if these activities are not carried out properly, not only does the community miss a tremendous opportunity to redevelop or clear out a hazardous area, it may be violating its obligations under the NFIP. In some areas, mutual aid agreements have been established so building inspectors from a community not affected by the disaster can work in the communities that were hit the hardest.

Local Implementation

The Placer County EOP has post-disaster recovery policies in place for the County. The Placer County EOP is intended to facilitate multi-agency and multi-jurisdictional coordination during emergencies including hazard events. Through its policies and procedures it seeks to mitigate the effects of hazards, prepare for measures to be taken which will preserve life and minimize damage, enhanced response during emergencies and provide necessary assistance, and establish a recovery system in order to return the

community to their normal state of affairs. The County is in the process of updating the EOP and annexes in 2021. Post disaster recovery procedures for all hazards, including flood, are primarily addressed the Recovery Annex to the EOP, and are detailed further in Section 4.4 of the base plan.

CRS Credit

The CRS does credit post-disaster mitigation procedures if the policies and procedures are incorporated into a flood mitigation or multi-hazard plan through Activity 510 - Floodplain Management Planning.

Conclusions and Recommendations

- Placer County should consider StormReady certification.
- There are several threat recognitions systems that can provide the County with advance notice of an impending emergency.
- Placer County depends on local media outlets, sirens, telephones and door-to-door notices to warn residents. These media should reach most people who need to know of a threat.
- Emergency management guidance could be very helpful when things happen quickly and for hazards that have predictable impacts, such as tornado, winter storms and flooding.
- Placer County should update and exercise its EOP on a regular basis.
- Placer County and its jurisdictions should continue to work together to protect people before and after a disaster including an outreach program to promote each community's warning system.

C.4.5. Flood Control Measures

Four general types of flood control projects are reviewed here: levees, reservoirs, diversions, and dredging. These projects have three advantages not provided by other mitigation measures:

- They can stop most flooding, protecting streets and landscaping in addition to buildings,
- Many projects can be built without disrupting citizens' homes and businesses, and
- They are constructed and maintained by a government agency, a more dependable long-term management arrangement than depending on many individual private property owners.

However, as shown below, structural measures also have shortcomings. The appropriateness of using flood control depends on individual project area circumstances.

Pros and Cons of Structural Flood Control Projects

- Advantages
 - ✓ They may provide the greatest amount of protection for land area used.
 - ✓ Because of land limitations, they may be the only practical solution in some circumstances.
 - ✓ They can incorporate other benefits into structural project design, such as water supply and recreational uses.
 - ✓ Regional detention may be more cost-efficient and effective than requiring numerous small detention basins.
- Disadvantages
 - ✓ They can disturb the land and disrupt the natural water flows, often destroying wildlife habitat.
 - ✓ They require regular maintenance, which if neglected can have disastrous consequences.

- ✓ They are built to a certain flood protection level that can be exceeded by larger floods, causing extensive damage.
- ✓ They can create a false sense of security, as people protected by a project often believe no flood can ever reach them.
- ✓ Although it may be unintended, in many circumstances they promote more intensive land use and development in the floodplain.

Levees and Floodwalls

Probably the best known flood control measure is a barrier of earth (levee) or concrete (floodwall) erected between the watercourse and the property to be protected. Levees and floodwalls confine water to the stream channel by raising its banks. They must be well designed to account for large floods, underground seepage, pumping of internal drainage, and erosion and scour. Key considerations when evaluating the use of a levee include:

- Design and permitting costs,
- Right of way acquisition,
- Removal of fill to compensate for the floodwater storage that will be displaced by the levee,
- Internal drainage of surface flows from the area inside the levee,
- Cost of construction,
- Cost of maintenance,
- Mitigation of adverse impacts to wetlands and other habitats,
- Loss of river access and views, and
- Creating a false sense of security, because while levees may reduce flood damage for smaller more frequent rain events, they may also overtop or breach in extreme flood events and subsequently create more flood damage than would have occurred without the levee.

Levees placed along the river or stream edge degrade the aquatic habitat and water quality of the stream. They also are more likely to push floodwater onto other properties upstream or downstream. To reduce environmental impacts and provide multiple use benefits, a setback levee is the best project design. The area inside a setback levee can provide open space for recreational purposes and provide access sites to the river or stream.

Floodwalls perform like levees except they are vertical-sided structures that require less surface area for construction. Floodwalls are constructed of steel sheet pile or reinforced concrete, which makes the expense of installation cost prohibitive in many circumstances. Floodwalls also degrade adjacent habitat and can displace erosive energy to unprotected areas of shoreline downstream.

Reservoirs and Detention

Reservoirs reduce flooding by temporarily storing flood waters behind dams or in storage or detention basins. Reservoirs lower flood heights by holding back, or detaining, runoff before it can flow downstream. Flood waters are detained until the flood has subsided, and then the water in the reservoir or detention basin is released or pumped out slowly at a rate that the river can accommodate downstream.

Reservoirs can be dry and remain idle until a large rain event occurs. Or they may be designed so that a lake or pond is created. The lake may provide recreational benefits or water supply (which could also help mitigate a drought).

Flood control reservoirs are most commonly built for one of two purposes. Large reservoirs are constructed to protect property from existing flood problems. Smaller reservoirs, or detention basins, are built to protect property from the stormwater runoff impacts of new development.

Figure 0-13 Retention Pond

Regardless of size, reservoirs protect the development that is downstream from the reservoir site. Unlike levees and channel modifications, they do not have to be built close to or disrupt the area to be protected. Reservoirs are most efficient in deeper valleys where there is more room to store water, or on smaller rivers where there is less water to be stored.

In urban areas, some reservoirs are simply manmade holes, excavated to store floodwaters. Reservoirs in urban areas are typically constructed adjacent to streams (though usually outside of the floodplain). When built in the ground, there is no dam for these retention and detention basins and no dam failure hazard. Wet or dry basins can also serve multiple uses by doubling as parks or other open space uses.

There are several considerations when evaluating the use of reservoirs and detention:

- There is the threat of flooding the protected area should the reservoir's dam fail,
- There is a constant expense for the management and maintenance of the facility,
- They may fail to prevent floods that exceed their design levels,
- Sediment deposition may occur and reduce the storage capacity over time,
- They can impact water quality as they are known to affect temperature, dissolved oxygen and nitrogen, and nutrient levels, and
- If not designed correctly, in-stream reservoirs may cause backwater flooding problems upstream

Diversion

A diversion is a new channel that sends floodwaters to a different location, thereby reducing flooding along an existing watercourse. Diversions can be surface channels, overflow weirs, or tunnels. During normal flows, the water stays in the old channel. During floods, the floodwaters spill over to the diversion channel or tunnel, which carries the excess water to a receiving lake or river.

Figure 0-14 Diversion

Diversions are limited by topography; they will not work in some areas. Unless the receiving water body is relatively close to the floodprone stream and the land in between is low and vacant, the cost of creating a diversion can be prohibitive.

Dredging

Dredging is often viewed as a form of conveyance improvement. However, it has the following problems:

- Given the large volume of water that comes downstream during a flood, removing a foot or two from the bottom of the channel will have little effect on flood heights.
- Dredging is often cost prohibitive because the dredged material must be disposed of somewhere.
- Unless in-stream or tributary erosion is corrected upstream, the dredged areas usually fill back in within a few years, and the process and the expense have to be repeated.
- If the channel has not been disturbed for many years, dredging will destroy the habitat that has developed.

Figure 0-15 Dredging Activity

To protect the natural values of the stream, federal law requires a U.S. Army Corps of Engineers permit before dredging can proceed. This can be a lengthy process that requires a lot of advance planning and many safeguards to protect habitats, which adds to the cost of the project.

CRS Credit

Structural flood control projects that provide 100-year flood protection and that result in revisions to the Flood Insurance Rate Map are not credited by the CRS in order to avoid duplicating the larger premium reduction provided by removing properties from the mapped floodplain.

The CRS credits smaller flood control projects that meet the following criteria:

- They must provide protection to at least the 25-year flood,
- They must meet certain environmental protection criteria,
- They must meet federal, state and local regulations, such as the Corps of Engineers' 404 permit and California Division of Dam Safety for dam safety rules, and
- They must meet certain maintenance requirements.

These criteria ensure that credited projects are well-planned and permitted. Any of the measures reviewed in this section would be recognized under Activity 530 - Flood Protection, although it would be very hard to qualify a dredging project. Credit points are based on the type of project, how many buildings are protected, and the level of flood protection provided.

Local Implementation

In coordination with California Department of Water Resources and the Placer County Flood Control and Water Conservation District, flood control and drainage facilities are being brought to current standards of flood protection and prevention.

Conclusions and Recommendations

- The County has previously received funding for construction of flood control and drainage facilities that will move storm and flood waters more efficiently and reduced potential for overbank flooding. The County is also considering additional projects in the Placer County Planning Area.
- Placer County, the cities, and special districts should continue to implement countywide drainage improvement projects to reduce the potential from overbank flooding along local drainages and flooding from localized stormwater events.

C.4.6. Public Information Measures

A successful hazard mitigation program involves both the public and private sectors. Public information activities advise property owners, renters, and businesses about hazards and ways to protect people and property from these hazards. These activities can motivate people to take the steps necessary to protect themselves and others.

Information can bring about voluntary mitigation activities at little or no cost to the government. Property owners mitigated their flooding problems long before government funding programs existed. The typical approach to delivering information involves two levels of activity. The first is to broadcast a short and simple version of the message to everyone potentially affected. The second level provides more detailed information to those who respond and want to learn more.

This section starts with activities that reach out to people and tell them to be advised of the hazards and some of the things they can do. It then covers additional sources of information for those who want to learn more. It ends with a general public information strategy.

Outreach Projects

Outreach projects are the first step in the process of orienting property owners to the hazards they face and to the concept of property protection. They are designed to encourage people to seek out more information in order to take steps to protect themselves and their properties.

Research has shown that outreach projects work. However, awareness of the hazard is not enough; people need to be told what they can do about the hazard. Thus, projects should include information on safety, health and property protection measures. Research has also shown that a properly run local information program is more effective than national advertising or publicity campaigns. Therefore, outreach projects should be locally designed and tailored to meet local conditions.

Community newsletters/direct mailings: The most effective types of outreach projects are mailed or distributed to everyone in the community. In the case of floods, they can be sent only to floodplain property owners.

News media: Local newspapers can be strong allies in efforts to inform the public. Press releases and story ideas may be all that's needed to gain their interest. After a flood in another community, people and the media become interested in their flood hazard and how to protect themselves and their property. Local radio stations and cable TV channels can also help. These media offer interview formats and cable TV may be willing to broadcast videos on the hazards.

Other approaches: Examples of other outreach projects include:

- Presentations at meetings of neighborhood, civic or business groups,
- Displays in public buildings or shopping malls,
- Signs in parks, along trails and on waterfronts that explain the natural features (such as the river) and their relation to the hazards (such as floods),
- Brochures available in municipal buildings and libraries, and
- Special meetings, workshops and seminars.

Local Implementation

Placer County maintains a website that provides in-depth flood protection information. The County also provides a direct mailing annually to residents, with a focus on repetitive loss areas, which include flyers on flood protection and property protection measures. The County also provides direct mailings on flood protection information to insurance brokers and realtors located throughout the County. In addition, the County's flood protection and stormwater group also conduct and participate in a variety of public community events throughout the year such as community fairs, river runs, river cleanups, etc. and provide information to the public on stormwater management and flood protection measures. The County also has a variety of flood materials placed in public locations.

CRS Credit

The Community Rating System provides credit for outreach projects which cover six flood-related topics. Credit is also available for producing flood response materials. Another way to achieve credit for outreach is for producing a plan for public information (PPI). A 40% bonus is applied to outreach credits which are included in a PPI.

Real Estate Disclosure

Many times after a flood or other natural disaster, people say they would have taken steps to protect themselves if they had known they had purchased a property exposed to a hazard. There are some federal and state requirements about such disclosures, but they have their limits.

Federal law: Federally regulated lending institutions must advise applicants for a mortgage or other loan that is to be secured by an insurable building whether the property is in a floodplain as shown on the Flood Insurance Rate Map. If so, flood insurance is required for buildings located within the floodplain if the mortgage or loan is federally insured. However, because this requirement has to be met only 10 days before closing, the applicant is often already committed to purchasing the property when he or she first learns of the flood hazard.

State law: State laws set standards for real estate sales and licensing of agents and brokers.

Local Implementation

Placer County receives credit for providing for the local real estate agents disclosure of flood hazards to prospective buyers. Credit is also provided for state and community regulations requiring disclosure of flood hazards.

CRS Credit

Communities in areas that have additional disclosure requirements are eligible for five points under the "Other disclosure requirements" as well as 10 points for the "Disclosure of other hazards."

Libraries and Websites

The two previous activities tell people that they are exposed to a hazard. The next step is to provide information to those who want to know more. The community library and local websites are obvious places for residents to seek information on hazards, hazard protection, and protecting natural resources.

Books and pamphlets on hazard mitigation can be given to libraries, and many of these can be obtained for free from state and federal agencies. Libraries also have their own public information campaigns with displays, lectures and other projects, which can augment the activities of the local government. Today, websites are commonly used as research tools. They provide fast access to a wealth of public and private sites for information. Through links to other websites, there is almost no limit to the amount of up to date information that can be accessed on the Internet.

In addition to online floodplain maps, websites can link to information for homeowners on how to retrofit for tornadoes and floods or a website about floods for children. The "FEMA for Kids" website teaches children how to protect their home and what to have in a family disaster kit.

Local Implementation

Placer County provides a variety of flood materials placed in public locations, including public buildings such as County Public Works Department and public libraries. The County also has an extensive flood protection websites at: <http://www.placer.ca.gov/departments/Works/FloodControl.aspx>

CRS Credit

The Community Rating System provides credit for having a variety of flood references in the local public library and additional credits for similar material included on municipal websites (Activity 350 - Flood Protection Information).

Technical Assistance

Hazard Information

Many benefits stem from providing map information to inquirers. Residents and business owners that are aware of the potential hazards can take steps to avoid problems or reduce their exposure to flooding. Real

estate agents and house hunters can find out if a property is floodprone and whether flood insurance may be required.

Communities can easily provide map information from FEMA's Flood Insurance Rate Maps (FIRMs) and Flood Insurance Studies. They may also assist residents in submitting requests for map amendments and revisions when they are needed to show that a building is located outside the mapped floodplain.

Some communities supplement what is shown on the FIRM with information on additional hazards, flooding outside mapped areas and zoning. When the map information is provided, community staff can explain insurance, property protection measures and mitigation options that are available to property owners. They should also remind inquirers that being outside the mapped floodplain is no guarantee that a property will never get wet.

Property Protection Assistance

While general information provided by outreach projects or the library is beneficial, most property owners do not feel ready to retrofit their buildings without more specific guidance. Local building department staffs are experts in construction. They can provide free advice, not necessarily to design a protection measure, but to steer the owner onto the right track.

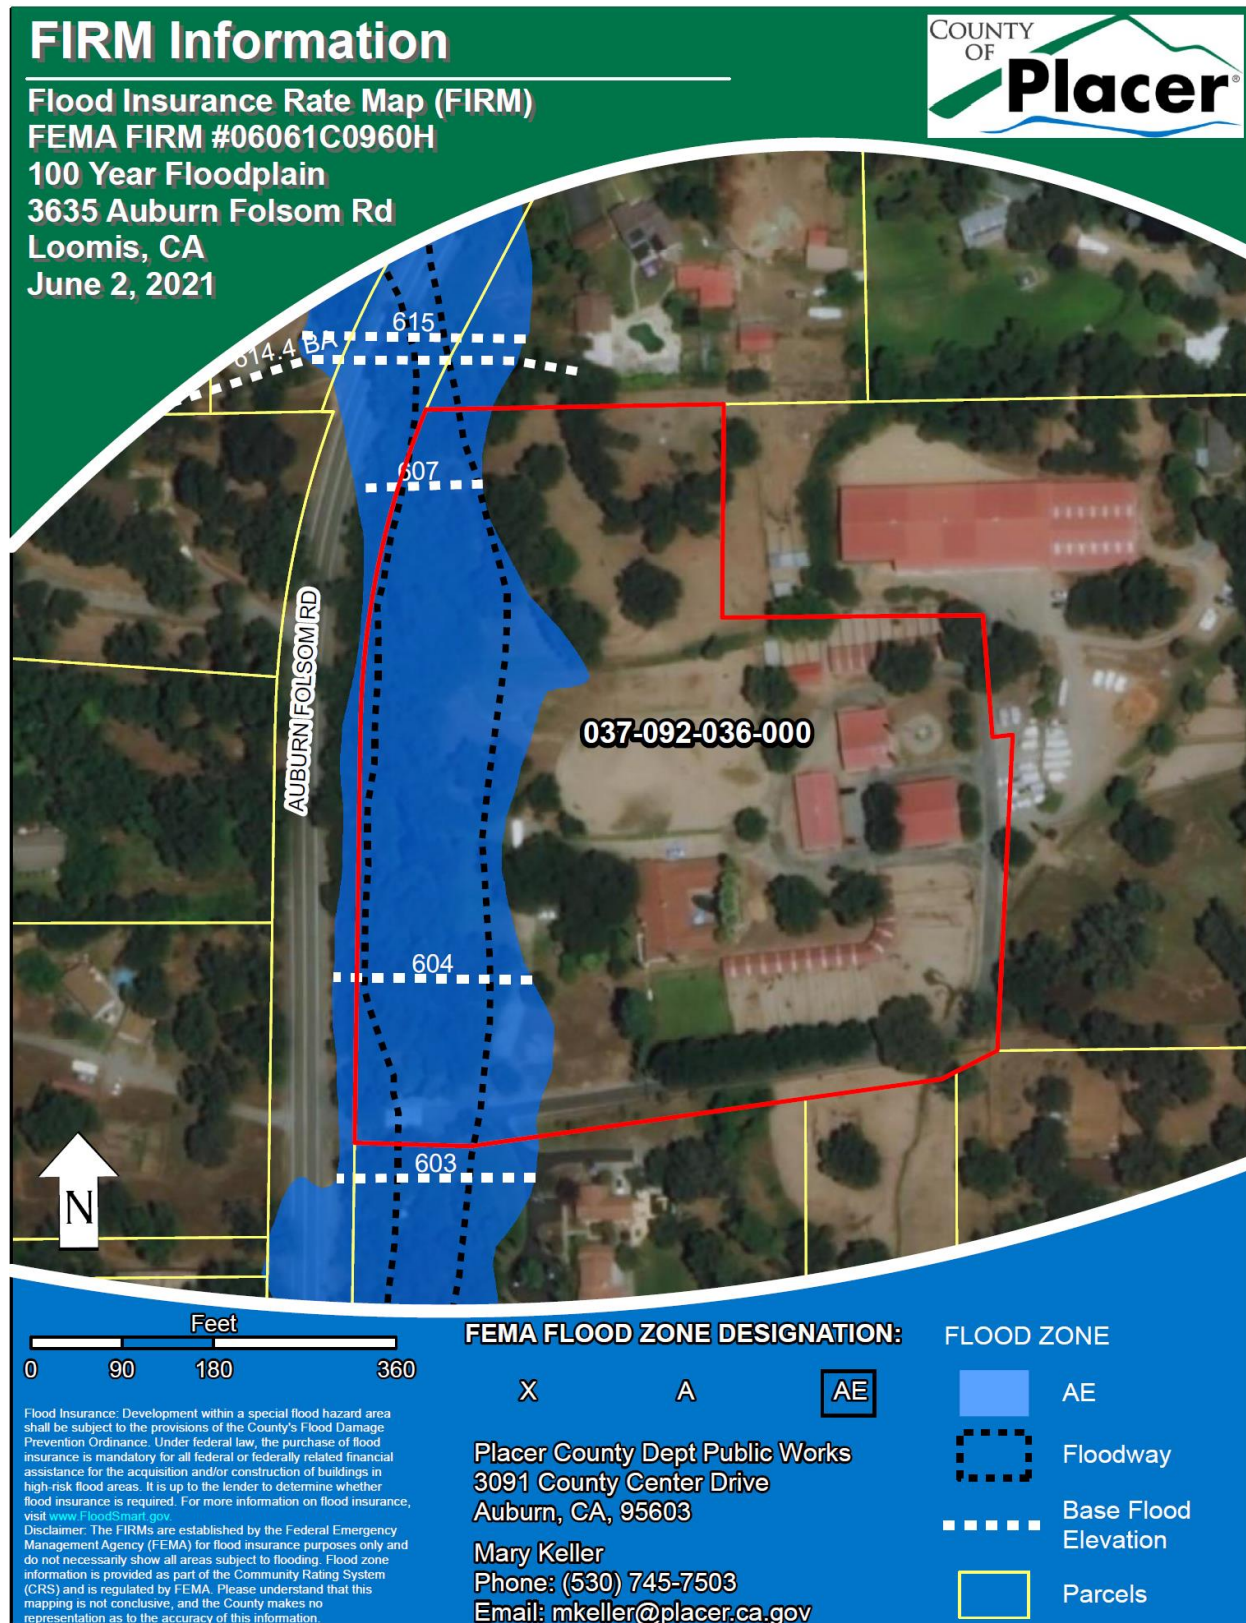

- Building or public works department staffs can provide the following types of assistance:
- Visit properties and offer protection suggestions,
- Recommend or identify qualified or licensed contractors,
- Inspect homes for anchoring of roofing and the home to the foundation,
- Provide advice on protecting windows and garage doors from high winds, and
- Explain when building permits are needed for home improvements.

There is a concern that a local official might provide the wrong information and the community would be sued if a project failed. To counter this, there are guidelines for local programs and training on how to identify the right measures. FEMA conducts a free week-long course at its Emergency Management Institute on property protection measures for flooding. FEMA and the Corps of Engineers periodically conduct one- or two-day retrofitting workshops.

Local Implementation

FEMA floodplain maps are available on FEMA's website, which is linked through the Placer County Floodplain Management website. The County also responds to requests on whether a property is located in a Special Flood Hazard Area. (see Figure 0-16 for example of what is provided on a floodplain determination request). The County also maintains elevation certificates for many existing homes within or near the SFHA. Elevation Certificates and LOMA's are listed on Placer County's website. Placer County is working with FEMA to update the current SFHA mapping completed in 2018 and expects an update for specific watershed labeled as Zone A without BFE to Zone AE with BFE in 2022.

Figure 0-16 Placer County Floodplain Determination

CRS Credit

The Community Rating System provides points for providing map information to inquirers. Points are available for providing one-on-one flood protection assistance to residents and businesses and for making site visits. Both services must be publicized.

Public Information Program Strategy

A public information program strategy is a document that receives CRS credit. It is a review of local conditions, local public information needs, and a recommended plan of activities. A strategy consists of the following parts, which are incorporated into this plan:

- The local flood hazard (discussed in Chapter 4 of this plan)
- The property protection measures appropriate for the flood hazard (discussed in Chapter 5 of this plan)
- Flood safety measures appropriate for the local situation (discussed in Chapter 5 of this plan)
- The public information activities currently being implemented within the community, including those being carried out by non-government agencies (discussed in Chapter 4 of this plan and jurisdictional annexes)
- Goals for the community's public information program (discussed in Chapter 3 and 5 of this plan)
- The outreach projects that will be done each year to reach the goals (discussed in Chapter 5 of this plan)
- The process that will be followed to monitor and evaluate the projects (discussed in Chapter 7)

Figure 0-17 illustrates several flood safety tips that can be used in an outreach campaign to better inform the public of the hazards associated with flooding.

Figure 0-17 Flood Safety Tips for Outreach Campaign

Flood Safety
<p>Pay attention to evacuation orders. Listen to local radio or TV stations for forecasts and emergency warnings. Know about evacuation routes and nearby shelters and have plans for all family members on how to evacuate and where to meet if you're split up during an emergency.</p>
<p>Do not drive through a flooded area. During a flood, more people drown in their cars than anywhere else. Don't drive around road barriers; the road or bridge may be washed out.</p>
<p>Do not walk through flowing water. Flash flooding is the leading cause of weather-related deaths in the U.S. Currents can be deceptive; 6 inches of moving water can knock you off your feet in a strong current. If you walk in standing water, use a stick to help you locate the ground.</p>
<p>Stay away from power lines and electrical wires. Electrical currents can travel through water. Report downed power lines to the police or sheriff by calling 911.</p>
<p>Have the power company turn off your electricity. Some appliances, like TV sets, keep electrical charges even after they've been unplugged. Don't use appliances or motors that have gotten wet unless they have been taken apart, cleaned and dried.</p>
<p>Look before you step. After a flood, the ground and floors are covered with debris like broken bottles and nails. Floors and stairs that are covered with mud can also be slippery.</p>
<p>Be alert for gas leaks. Use a flashlight to inspect damage. Don't smoke or use candles, lanterns, or open flames unless you know the gas has been shut off and the area has been ventilated.</p>
<p>Look out for animals that may have been flooded out of their homes and who may seek shelter in yours. Use a pole or stick to turn things over and scare away small animals.</p>
<p>Look before you step. After a flood, the ground and floors are covered with debris. Floors and stairs that have been covered with mud will be very slippery.</p>
<p>Carbon monoxide exhaust kills. Use a generator or other gasoline-powered machine outdoors. The same goes for camping stoves. Charcoal fumes are especially deadly – cook with charcoal outdoors.</p>
<p>Clean everything that got wet in the flood. Floodwaters have picked up sewage and chemicals from roads, farms, factories, and storage buildings. Spoiled food, and flooded cosmetics and medicines can be health hazards. When in doubt, throw it out.</p>
<p>Take care of yourself. Recovering from a flood is a big job. It is tough on both the body and the spirit and the effects a disaster has on you and your family may last a long time.</p>

Local Implementation

Placer County conducts a public information campaign using a variety of mechanisms to inform residents of the flood and other hazards and to provide information to foster better floodplain management throughout the County Planning Area. An overview of the County's outreach efforts can be seen at: <https://www.placer.ca.gov/1498/Floodplain-Management>. The County does not currently utilize a PPI for outreach.

CRS Credit

The CRS provides up to 350 points for a Plan for Public Information (PPI).

Conclusions and Recommendations

- There are many ways that public information can be used so that people and businesses will be more aware of the hazards they face and how they can protect themselves.
- Libraries and websites are currently being used as public information tools in Placer County.
- The most important topics to cover in public information activities are:
 - ✓ Safety precautions for all types of hazards, but especially tornados, earthquakes, thunder storms, winter storms, wildfires, and floods.
 - ✓ Knowing where emergency evacuation shelters are in town.
 - ✓ Flood protection measures, including rules for new construction and insurance.
 - ✓ Keeping drainage ways clear and protection from local drainage problems.
 - ✓ Family and emergency preparedness measures.
 - ✓ What the County and cities are doing and sources of assistance.
 - ✓ Protecting water quality and wetlands and the benefits of open space.
- The most appropriate ways to spread this information are:
 - ✓ Websites and social media
 - ✓ Mailings to everyone, in utility bills or otherwise
 - ✓ News releases or newspaper articles
 - ✓ Newsletters
 - ✓ Displays, particularly at special events
 - ✓ Handouts, flyers and other materials, which can be distributed at special events and presentations
- County and City staff should continue to reach out to residents, civic organizations and other organizations to help spread the word about flood hazards, flood protection, and safety measures.

Appendix D Adoption Resolution

Note to Reviewers: When this plan has been reviewed and approved pending adoption by FEMA Region IX, the adoption resolutions will be signed by the participating jurisdictions and added to this appendix. Two model resolutions are provided below. The first sample resolution is for the County and incorporated communities; the second is for participating districts.

Sample Resolution: Placer County and incorporated communities

Resolution # _____

Adopting the Placer County Local Hazard Mitigation Plan Update

WHEREAS, The (Name of Government/District/Organization seeking FEMA approval of hazard mitigation plan) recognizes the threat that natural hazards pose to people and property within our community; and

WHEREAS, undertaking hazard mitigation actions will reduce the potential for harm to people and property from future hazard occurrences; and

WHEREAS, the U.S. Congress passed the Disaster Mitigation Act of 2000 (“Disaster Mitigation Act”) emphasizing the need for pre-disaster mitigation of potential hazards; and

WHEREAS, the Disaster Mitigation Act made available hazard mitigation grants to state and local governments; and

WHEREAS, an adopted Local Hazard Mitigation Plan is required as a condition of future funding for mitigation projects under multiple FEMA pre- and post-disaster mitigation grant programs; and

WHEREAS, the (Name of Government/District/Organization seeking FEMA approval of hazard mitigation plan) fully participated in the FEMA-prescribed mitigation planning process to prepare this local hazard mitigation plan; and

WHEREAS, the California Office of Emergency Services and Federal Emergency Management Agency, Region IX officials have reviewed the Placer County Local Hazard Mitigation Plan and approve it contingent upon this official adoption of the participating governing body; and

WHEREAS, the (Name of Government/District/Organization seeking FEMA approval of hazard mitigation plan) desires to comply with the requirements of the Disaster Mitigation Act and to augment its emergency planning efforts by formally adopting the Placer County Local Hazard Mitigation Plan by reference into the Safety Element of the General Plan in accordance with the requirements of AB 2140; and

WHEREAS, adoption by the governing body for the (Name of Government/District/Organization seeking FEMA approval of hazard mitigation plan) demonstrates the jurisdiction’s commitment to fulfilling the mitigation goals and objectives outlined in this Local Hazard Mitigation Plan; and

WHEREAS, adoption of this legitimizes the plan and authorizes responsible agencies to carry out their responsibilities under the plan.

NOW, THEREFORE, BE IT RESOLVED that the (Name of Government/District/Organization seeking FEMA approval of hazard mitigation plan) adopts the Placer County Local Hazard Mitigation Plan as an official plan; and

BE IT RESOLVED, that the (Name of Government/District/Organization seeking FEMA approval of hazard mitigation plan) adopts the Placer County Local Hazard Mitigation Plan by reference into the safety element of their general plan in accordance with the requirements of AB 2140; and

BE IT FURTHER RESOLVED, the (Name of Government/District/Organization seeking FEMA approval of hazard mitigation plan) will submit this adoption resolution to the California Office of Emergency Services and FEMA Region IX officials to enable the plan’s final approval in accordance with the requirements of the Disaster Mitigation Act of 2000 and to establish conformance with the requirement of AB 2140.

Sample Resolution: Special Districts in Placer County

Resolution # _____

Adopting the Placer County Local Hazard Mitigation Plan Update

Whereas, (Name of Government/District/Organization seeking FEMA approval of hazard mitigation plan) recognizes the threat that natural hazards pose to people and property within our community; and

Whereas, undertaking hazard mitigation actions will reduce the potential for harm to people and property from future hazard occurrences; and

Whereas, the U.S. Congress passed the Disaster Mitigation Act of 2000 (“Disaster Mitigation Act”) emphasizing the need for pre-disaster mitigation of potential hazards;

Whereas, the Disaster Mitigation Act made available hazard mitigation grants to state and local governments;

Whereas, an adopted Local Hazard Mitigation Plan is required as a condition of future funding for mitigation projects under multiple FEMA pre- and post-disaster mitigation grant programs; and

Whereas, (Name of Government/District/Organization) fully participated in the FEMA-prescribed mitigation planning process to prepare this local hazard mitigation plan; and

Whereas, the California Office of Emergency Services and Federal Emergency Management Agency, Region IX officials have reviewed the Placer County Local Hazard Mitigation Plan and approved it contingent upon this official adoption of the participating governing body;

Whereas, the (Name of Government/District/Organization) desires to comply with the requirements of the Disaster Mitigation Act and to augment its emergency planning efforts by formally adopting the Placer County Local Hazard Mitigation Plan;

Whereas, adoption by the governing body for the (Name of Government/District/Organization), demonstrates the jurisdiction’s commitment to fulfilling the mitigation goals and objectives outlined in this Local Hazard Mitigation Plan.

Whereas, adoption of this legitimizes the plan and authorizes responsible agencies to carry out their responsibilities under the plan.

Now, therefore, be it resolved, that the (Name of Government/District/Organization) adopts the Placer County Local Hazard Mitigation Plan as an official plan; and

Be it further resolved, (Name of Government/District/Organization) will submit this adoption resolution to the California Office of Emergency Services and FEMA Region IX officials to enable the plan’s final approval in accordance with the requirements of the Disaster Mitigation Act of 2000.

<i>Eriogonum umbellatum</i> var. <i>torreyanum</i>	Donner Pass buckwheat	None	None	–	1B.2
<i>Potamogeton epihydrus</i>	Nuttall's ribbon-leaved pondweed	None	None	–	2B.2
<i>Stuckenia filiformis</i> ssp. <i>alpina</i>	slender-leaved pondweed	None	None	–	2B.2
<i>Ceanothus fresnensis</i>	Fresno ceanothus	None	None	–	4.3
<i>Rhamnus alnifolia</i>	alder buckthorn	None	None	–	2B.2
<i>Ivesia sericoleuca</i>	Plumas ivesia	None	None	–	1B.2
<i>Brodiaea rosea</i> ssp. <i>vallicola</i>	valley brodiaea	None	None	–	4.2
<i>Brodiaea sierrae</i>	Sierra foothills brodiaea	None	None	–	4.3
<i>Viola tomentosa</i>	felt-leaved violet	None	None	–	4.2

Sources: California Natural Diversity Database BIOS Viewer Tool

Federal Status

Endangered: The classification provided to an animal or plant in danger of extinction within the foreseeable future throughout all or a significant portion of its range.

Threatened: The classification provided to an animal or plant which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.

Proposed Endangered: The classification provided to an animal or plant that is proposed for federal listing as Endangered in the Federal Register under Section 4 of the Endangered Species Act.

Proposed Threatened: The classification provided to an animal or plant that is proposed for federal listing as Threatened in the Federal Register under Section 4 of the Endangered Species Act.

Candidate: The classification provided to an animal or plant that has been studied by the United States Fish and Wildlife Service, and the Service has concluded that it should be proposed for addition to the Federal Endangered and Threatened species list.

None: The plant or animal has no federal status.

Delisted: The plant or animal was previously listed as Endangered or Threatened, but is no longer listed on the Federal Endangered and Threatened species list.

CDFW Status

FP: Fully Protected: This classification was the State of California's initial effort to identify and provide additional protection to those animals that were rare or faced possible extinction.

SSC: Species of Special Concern: To this end, the Department has designated certain vertebrate species as "Species of Special Concern" because declining population levels, limited ranges, and/or continuing threats have made them vulnerable to extinction. The goal of designating species as "Species of Special Concern" is to halt or reverse their decline by calling attention to their plight and addressing the issues of concern early enough to secure their long-term viability.

WL: Watch List: Species that were previously designated as "Species of Special Concern" but no longer merit that status, or which do not yet meet SSC criteria, but for which there is concern and a need for additional information to clarify status.

CA Rare Plant Rank

1A: Plants presumed extinct in California and rare/extinct elsewhere

1B.1: Plants rare, threatened, or endangered in California and elsewhere; seriously threatened in California

1B.2: Plants rare, threatened, or endangered in California and elsewhere; fairly threatened in California

1B.3: Plants rare, threatened, or endangered in California and elsewhere; not very threatened in California

- 2A: Plants presumed extirpated in California, but more common elsewhere
- 2B.1: Plants rare, threatened, or endangered in California, but more common elsewhere; seriously threatened in California
- 2B.2: Plants rare, threatened, or endangered in California, but more common elsewhere; fairly threatened in California
- 2B.3: Plants rare, threatened, or endangered in California, but more common elsewhere; not very threatened in California
- 3.1: Plants about which we need more information; seriously threatened in California
- 3.2: Plants about which we need more information; fairly threatened in California
- 3.3: Plants about which we need more information; not very threatened in California
- 4.1: Plants of limited distribution; seriously threatened in California
- 4.2: Plants of limited distribution; fairly threatened in California
- 4.3: Plants of limited distribution; not very threatened in California
